The countries that have an amendment rate below <#> (defined as .75-1.24 for national constitutions) and also have a constitution older than the international average of 51 years include Australia, Finland, Ireland, and the United States. The proposition implies that these four countries either have found an alternative means (judicial review in the United States) or are under strong pressure to find another means. Denmark, Germany, Iceland, Italy, and Japan are all within a few years of falling into the same category, and if the proposition is at all useful, they should experience progressively stronger inclinations toward either a more active judiciary or a new constitution in the coming decades. A trend toward an active judiciary is already well advanced in Germany and is also becoming apparent in Japan.

Proposition 6. In the absence of a high rate of constitutional replacement, the lower the rate of formal amendment the more likely the process of revision is dominated by a judicial body.

In the absence of further research, there is only indirect evidence for this proposition. Table 6 shows that the lower the rate of amendment, the less the legislature dominates. The executive is usually not a major actor in a formal amendment process, so we are left with the judiciary.

PROPOSITION 7. The higher the formal amendment rate, a) the less likely the constitution is being viewed as a higher law, b) the less likely a distinction is being drawn between constitutional matters and normal legislation, c) the more likely the constitution is being viewed as a code, and d) the more likely the formal amendment process is dominated by the legislature.

Discussion of Table 6 has supported all parts of this proposition.

Proposition 8. The more important the role of the judiciary in constitutional modification, the less likely the judiciary is to use a theory of strict construction.

In the absence of further research, proposition 8 is a prediction to be tested.

CONCLUSION

I have examined two sets of constitutions. Each set is composed of documents that are taken seriously as constitutions. Every document in these two sets has a formal amendment process that is self-sufficient; that is, it depends on no other constitution to carry

out a formal amendment of itself. The two sets of constitutions examined together comprise at least three-fourths of the existing documents defined by these two characteristics.⁷

A comparative, empirical study of the amendment process in these 82 documents leads to four specific conclusions about the amendment process, as well as four more general conclusions about constitutions. The first specific conclusion is that the variance in amendment rate is largely explained by the interaction of two variables: the length of the constitution and the difficulty of the amendment process.

Second, it is possible to manipulate these two variables to produce more or less predictable rates of amendment. The strong linear effects of length and the hyperbolic curve that describes the effects of difficulty—these two together allow us to formulate an equation that generates a pattern of amendment rates close to what we found empirically. If we let A represent the amendment rate, D the score on the index of difficulty, and L the length of a constitution in words, the equation representing their interrelationship is

$$A = [1/D + ((L/10,000) \times .6)] - .3.8$$

Third, there is evidence that the amendment rate affects the probability that a constitution will be replaced and that a moderate amendment rate (between .75 and 1.25 amendments per year) is conducive to constitutional longevity.

Fourth, beyond a certain point, making the amendment process more difficult is an "inefficient" way to keep the amendment rate in the moderate range. Rather, it is easiest to do so by avoiding the extremes of either the legislative dominance or the referendum strategies and combining either the legislative complexity or the intervening election strategy with a relatively short document (10–20 thousand words).

Among more general conclusions, the first is that institutions have consequences and that the effects of institutional definitions in constitutions can be studied empirically.

Second, the similarity in amendment patterns between the American state constitutions and the national constitutions raises the possibility that for other aspects of constitutional design, one set of documents may be useful in developing propositions for studying the other set and therefore that there are basic principles of constitutional design operating independently of cultural, historical, geographic, and short-term political considerations.

Third, the first two general conclusions together suggest the possibility of discovering a set of principles that can be used to design constitutions with predictable results.

Fourth, the study of the amendment process strongly suggests that constitutional institutions cannot be studied in isolation from each other. Just as the operation of the legislature may strongly affect the patterns we find in the amendment process, the design of the amendment process may affect the operation of the court; and seemingly unrelated aspects of a constitution (e.g., its length and formal amendment process) may be linked in their consequences.

Finally, it is interesting that Buchanan and Tulloch's rational cost analysis receives some empirical support, although with a twist. Their general principle holds that constitutional choice rests on a tradeoff between decision costs and external costs (Buchanan and Tulloch 1965). Since constitutions contain important political settlements, any amendment carries with it the danger of serious externalities. Although an apparently rational actor might seek a very difficult amendment process in order to minimize externalities, such a one might also attempt to minimize externalities by constitutionalizing their interests, since the more specific the policy content of the constitution on a topic, the less danger there is that unwanted externalities will be imposed. This latter analysis would imply a fairly easy amendment process. However, a process that allows one actor to safeguard its interests allows all actors to do so. The data in this study indicate that the more policy content there is in a constitution, the longer it becomes. Both an easy amendment process (which leads to greater length and thus a higher amendment rate) and a very difficult amendment process (which leads to a very low amendment rate) produce a higher probability that a constitution will be replaced entirely. Thus, the two short-range types of behavior likely to be engaged in by a rational actor are irrational in the long-run, because when a constitution is replaced, everything is once again up for grabs—a situation in which constitutional safeguards against external costs are no longer in effect at the very time externalities are threatened on all serious political matters. Therefore, a truly rational actor would seem to be one who attempts to avoid constitutional replacement and instead avoids an amendment rate that is too high or too low. This would seem to argue for constitutional brevity and a moderately difficult amendment process on grounds of rationality.

APPENDIX A

Table A-1 presents an index to measure the degree of difficulty associated with each amendment process.

APPENDIX B

Table B-1 lists the numbers assigned by the index to every step required by the amendment processes.

APPENDIX C

Table C-1 shows the index of difficulty scores tabulated for the national constitutions of 32 countries along with other constitutional characteristics.

Note: Cross-national constitutional data have been taken from the constitutions themselves and from commentaries on these documents, found primarily in Albert P. Blaustein and Gisbert H. Flanz, Constitutions of the Countries of the World, 19 vols. (Dobbs Ferry, NY: Oceana, 1987) and supplements.

STATA, and the figure was then reproduced by hand using Geotype overlay techniques to enhance readability.

5. These broad categories were constructed using the theoretical premises developed herein and thus are independent of any categorization schemes developed previously by others. For an instructive comparison, see Lijphart 1984, 189–91. In order for a country to be included, it had to have at least one 15-year period free of military rule or serious instability, during which constitutionalism was taken seriously. Reliable data on the number and nature of amendments for that country also had to be available to the researcher. The unavailability of such data explain the absence of the Netherlands, for example, or for Austria before 1975.

6. On this topic, see Antieu 1982 and McWhinney 1956.

7. Canadian provincial and Australian state constitutions are prominent among those remaining to be examined. Also, Israel, Canada, and the United Kingdom, although lacking a simple written constitution, remain to be included. The problem in each of these three cases lies in determining what has constitutional status. An initial attempt to do so, using the content of the New Zealand Constitution as a template, yielded the following very preliminary estimates for two of these legislative supremacy countries:

	Israel	United Kingdom
Amendment rate	2.5+	7.5+
Index of difficulty	.50	.60
Length	10,000+	250,000+
Relevant years	1949–91	1900–1991

8. One part of the equation factors the effects of length in by dividing the number of words in the constitution by 10,000 and multiplying by .60. The second part approximates the effects of amendment difficulty by using the formula for a hyperbolic curve: A = 1/D. However, this is only approximate, and subtracting .30 from the effects of amendment difficulty results in the curve of best fit for the raw data scores.

EXPECTATIONS AND PREFERENCES IN BRITISH GENERAL ELECTIONS

RICHARD NADEAU Université de Montréal RICHARD G. NIEMI University of Rochester TIMOTHY AMATO University of Iowa

Te address two questions: How do people form their expectations about the likely winner of the next general election? and What are the links between expectations and votes? Using data collected by the Gallup organization in Great Britain, we find that the expectations formation process (1) has a significant inertia component but also a rapid adjustment to current information; (2) reflects voters' ability to translate economic expectations into political forecasts; and (3) is "time-bounded," possessing special characteristics immediately before and after a general election. The analysis also confirms the existence of a small bandwagon effect, whereby expectations that one party will win inflate that party's vote. The ability of voters to make reasonable forecasts without being unduly influenced by their own preferences suggests that under normal circumstances voters are expressing real preferences and not simply following the crowd.

The idea that observed contemporary behaviors are strongly linked to expectations about future outcomes has become so central for economists that much of economic theory has been rewritten to take explicit account of this concept (Begg 1982; Hudson 1982, chap. 3). Political scientists have also shown a growing interest in expectations, with future prospects proving to be particularly useful in studying certain aspects of electoral behavior. The now-common use of the notions of viability and electability, as well as the classification of voters as straightforward, sincere, or strategic, exemplify this trend (Abramson et al. 1992; Bartels 1988; Niemi, Whitten, and Franklin 1992). The simple act of voting is increasingly conceived of in terms of utilities (voters' preferences) and probabilities (voters' assessments of candidates' chances of winning).

Two crucial questions are at the nexus of the votes-expectations literature: How do people form their expectations and What are the links between expectations and votes? We address these questions with data collected by the Gallup organization. This unique data set includes not only the usual measurement of voters' preferences among parties but also a systematic tracking of voters' expectations about the outcome of the next general election. The fact that this information is available on a monthly basis for more than a decade permits systematic study of the expectations formation process and of the links between expectations and votes not only during election periods but also in less intense, interelection times.2 The data are thus attractive despite their obvious limitations.³

We shall present a simultaneous-equation votes—expectations model,⁴ paying particular attention to the expectations formation process.⁵ We then present our findings, which show a modest effect of expectations on voting behavior and stronger and more variegated effects—including "instantaneous" adjustments—of voting intentions on expectations. We

discuss the theoretical implications of our findings in the conclusion.

A VOTES-EXPECTATIONS MODEL

The votes-expectations literature has been mainly concerned with the existence and form of a pattern of reciprocal causation between voters' preferences and their assessments of the electoral campaigns (i.e., the parties' standings). Consistent with this perspective, we examine here two possibilities: (1) that voting intentions are affected by expectations about the likely winner of the next general election (bandwagon effect) and (2) that expectations about which party will win the next election are dependent on current vote intentions (whether through a sophisticated treatment of information or a simple projection effect).

Practically speaking, what is required is that we devise and estimate a simultaneous equations system formed of a vote equation and an expectations equation. As is standard in simultaneous equations models, we estimate our model using two-stage least squares. To obtain consistent estimates, we must pay particular attention to model specification and estimation, especially the less-frequently-studied expectations equation. Substantive questions concerning the appropriate specification of the model will be discussed. Identification issues, estimation strategy, and diagnostic tests are described in Appendices A and B.

The Vote Equation

To specify the vote equation of our simultaneousequation model, we build from the extensive literature on the short-term dynamics of political party popularity in Britain (Alt 1979; Clarke, Mishler, and Whiteley 1990; Clarke, Stewart, and Zuk 1986; Dunleavey and Husbands 1985; Frey and Schneider 1978; Goodhart and Bhansali 1970; Hibbs 1982; Hudson 1985; Lewis-Beck 1988; Mishler, Hoskin, and Fitzger-ald 1989; Miller and Mackie 1973; Norpoth 1991; Pissarides 1980; Sanders, Ward, and Marsh 1991). In particular, we searched for a satisfactory mix of economic and political indicators to serve as control variables whose inclusion would prevent us from inflating the impact of the expectations term. The specification we arrived at follows closely the prescription of Clarke, Mishler, and Whiteley:

A properly specified model of government popularity requires four broad classes of explanatory variables: . . . the long-term predispositions of voters, . . . issue perceptions which include retrospective and prospective thinking about economic and noneconomic issues, . . . leadership images, which relate both to the government and opposition parties, . . . [and] various systematic and random shocks to the system. (1990, 66)

Our specification is shown in equation 1:

$$VCL_{t} = \beta_{0} + \beta_{1}VCL_{t-1} + \beta_{2}MPSHARE_{t} + \beta_{3}UNEMP_{t-1}$$

$$+ \beta_{4}INF_{t-1} + \beta_{5}PEXP_{t} + \beta_{6}LEADERS_{t}$$

$$+ \beta_{7}FALK + \beta_{8}WCL_{t}, \qquad (1)$$

where VCL is the percent intending to vote Conservative minus percent intending to vote Labour (percent calculated after excluding don't knows, undecideds, refusals); MPSHARE is the ratio of the percent intending to vote for a minor party to the sum of the percents intending to vote Conservative or Labour; UNEMP is the unemployment rate, monthly, seasonally adjusted; INF is the monthly inflation rate calculated from the adjusted retail price index; PEXP is the percent thinking that personal economic conditions will improve over the next 12 months minus percent thinking that personal economic conditions will worsen over the next 12 months; LEADERS is the percent approval of the prime minister minus percent approval of the opposition leader. FALK is a dummy variable equal to 1 for May–June 1982 (the Falklands War), 0 otherwise; and WCL is the percent thinking that the Conservatives are most likely to win the next general election minus percent thinking that Labour is most likely to win.⁶

The coding of the variables and the form of the equation deserve brief explanation. Our major concern, of course, is with the impact of expectations about the winner—WCL.⁷ It is assumed that this impact is instantaneous, that is, that the gap measured in the current poll is already reflected in vote intentions. The assumption of immediate effects will be discussed in considerable detail, when we make a similar assumption about the effects of vote intentions on expectations. The expectations variable itself is expressed as a percentage difference because the popularity gap between the parties is at the core of thinking of one as a potential winner and the other as a loser. Likewise, the vote intentions variable is measured as a percentage difference.

The most interesting of the remaining variables in the vote equation is VCL_{t-1} . Under normal circum-

stances vote intentions "do not move abruptly from one moment to the next one, but at a sluggish pace instead" (Norpoth 1991, 146). We include the lagged dependent variable to capture this inertia component. Following Norpoth, this variable may be conceived as reflecting a "short-term memory" process, whereas our constant term may be an indicator of the "long-term component of popularity" (pp. 146–47).

Based on Mishler, Hoskin, and Fitzgerald's (1989) results, we also checked, by including the MPSHARE variable, whether the party balance between Conservatives and Labour was affected by the electoral fortunes of third parties. As theory and recent empirical work suggest that voters' evaluations of government economic performance may be a blend of both objective conditions and subjective perceptions,8 we added to our vote equation the unemployment rate, the inflation rate, and a variable reflecting voters' prospective assessments of their personal economic situations over the next 12 months. 9 The inclusion of unemployment and inflation appears sensible because both are "highlighted by the media, and salient to the voter" (Clarke, Mishler, and Whiteley 1990, 66; see also Mosley 1984). 10 The subjective perception variable (PEXP) was selected after various tries with similar variables. 11

Inclusion of the variable LEADERS follows what has become standard practice in British studies. Given the finding by Mishler, Hoskin, and Fitzgerald that "the relationship between leader satisfaction and party support is highly significant" (1989, 228), it is also consistent with our goal of not inflating the expectations term in our vote equation. Moreover, this inclusion also seems justified on theoretical grounds, as "recent research suggests that although related, leadership satisfaction and party popularity are conceptually distinct and empirically separable (Clarke, Mishler, and Whiteley 1990, 68). Finally, the Falklands War exemplifies a major disruption to the usual pattern of stability, and a variable was included to take it into account.

The Expectations Equation

In the search for an appropriate specification for our expectations equation, we faced more difficulties than for the vote equation. First, while popularity functions have long been available and have been extensively studied, such is not the case for expectations; there is no extensive body of research on expectations comparable to that for vote intentions. Second, our dependent variable—the expectations question—lacks the immediate time horizon of the vote question (who will win "the next general election" versus one's vote if there were a general election "tomorrow").

Some insight can be derived from work on expectations in economics. Early attempts to model the expectation formation process centered on the "adaptive" expectations model, where lagged values of a variable were used to predict current inflation or other relevant economic quantities (e.g., Cagan 1956 and Nerlove 1958; a good summary is Nerlove, Gre-

ther, and Carvalho 1979, chap. 10). These initial attempts were subsequently criticized as being "atheoretical" and inconsistent with any explicit optimizing behavior on the part of individuals within the model. Later research in economics argued that expectations were formed "rationally" or in a "model consistent" manner (Lucas 1973; Nerlove, Grether, and Carvalho 1979, chap. 10; Sargent and Wallace 1975); that is, expectations of an economic variable should be based upon all the variables in the model and not just the past values of that variable. 14

Our approach to modeling the expectations formation process lies somewhere between these two polar cases. Like the early critics of the "adaptive" expectations process, we recognize that more than lagged values of a variable are required to explain how individuals make forecasts of quantities they find important. However, we also recognize that the rational expectations model used in economics may be too strong for our explicitly political analysis. In particular, an empirical economic model that incorporates the rational expectations assumption will typically include a series of economic variables in the expectations equation. This is because economic agents are assumed to use these variables in forecasting, say, inflation or unemployment. Given the time horizon of the economists' expectations model, this strategy makes perfect sense. One is typically interested in forecasting inflation or any other economic variable for the *next* period.

In our political model the argument is different. The agents in our model are voters, and they are often asked to forecast an event (the election outcome) many periods from now. Consequently, economic information in the form of inflation and unemployment rates will not be particularly useful since current values provide very little predictive power for economic variables possibly two or three years from today. 15 Other restrictions to the expectations equation appear plausible as well. The leader variable used in the vote equation is strongly retrospective rather than prospective, ¹⁶ and the minor party share variable certainly does not capture the complexities related to the translation of small parties' short-term success into major parties' future electoral prospects. Finally, we theorize that single events such as the Falklands War are unlikely to influence expectations except insofar as they leave their imprint on the parties' standings.

The variables that will be important in forming our "political" expectations are those with an avowedly political component, including such factors as parties' levels of support, party reputation, and the period in the electoral cycle, plus one economic variable that asks respondents to look forward a full year. The following equation reflects this mode of thinking:¹⁷

WCL_t =
$$\alpha_0 + \alpha_1$$
WCL_{t-1} + α_2 POSTELECT * WCL_{t-1}
+ α_3 VCL_t + α_4 PREELECT * VCL_t + α_5 PEXP_t + α_6 D8387,

where WCL, VCL, and PEXP are defined as in equation 1; POSTELECT is a dummy variable equal to 1 in

May–July 1979 and July–September 1983, 0 otherwise; PREELECT is a dummy variable equal to 1 in February–April 1979 and April–June 1983 and 1987, 0 otherwise; and D8387 is a dummy variable equal to 1 from July 1983 to June 1987, 0 otherwise.

The equation suggests, first of all, that there is an inertia component to expectations about the winner of the next election. Some individuals—through general lack of attention to politics, a failure during specific periods to absorb new information about the parties, or a heavy discounting of new information for partisan or other reasons—fail to reassess their expectations (or do so only after some delay). The lagged dependent variable taps this inertia.

In addition, one might include an inertia component in the expectations formula as used here because of the form of the measurement available to us. Our dependent variable reflects the aggregation of individual responses to a question allowing only nominal choices of the most likely winning party. Yet we would hypothesize that individuals form their expectations on a continuous scale (e.g., from 0 to 100). Thus, when asked about the most likely winner of the next election, one might considerably reassess the subjective probability that a party will defeat its opponents without crossing the 50% threshold. Such individuals, constrained by the format of the question in the Gallup surveys, will appear unchanged even though they have thoroughly reassessed a party's chances. Thus, in addition to capturing inattentiveness to political events, the lagged term will reflect hypothesized fine changes that are masked by the available measurement.

The second term in the expectations equation reflects the fact that electoral expectations—including lagged effects—are not "time-free." They are, on the contrary, "time-bounded" by the event about which they are formed, namely, the next election (see, e.g., Lewis-Beck and Skalaban 1989, 150-51). One aspect of this timing is that voters adopt a different perspective in forming their expectations in the months immediately after an election. To illustrate this point, consider the 1983 election. In the last Gallup poll available, fully 87% of the respondents believed that the Tories would win the election, and only 5% thought Labour would win. (WCL, our dependent variable, reaches its highest point, 82%, at that time.) In the month immediately following the election, the same percentages were, respectively, 49 and 16. After an election, voters clearly keep in mind that a new ball game has begun. To represent this discontinuity in expectations after the election, we included an interactive term, POSTELECT * WCL_{t-1}, in our

Of greatest interest in the expectations equation are the next two variables, which together constitute an adjustment for *current* voting intentions. Theoretically, we are adopting here the portion of the rational expectations view that says that individuals "use current available and relevant information in forming their expectations and do not rely purely upon past experiences" (Shaw 1983, 47). Specifically, we are

assuming that *current* information about vote intentions affects perceptions about which party is likely to win the next election.¹⁹ Of course, in a literal sense individuals cannot be reacting to the results of a survey that is only then being conducted. But people do have very recent, even simultaneous, bases for their answers.

Information about candidates, parties, and politics bombards voters on a daily basis. Some of it comes directly in the form of news reports from the media; some of it is filtered through friends and acquaintances. Some of it is directly in the form of horse-race reports;²⁰ some of it is in the form of stories about candidates' characteristics and activities. Any single story, of course, may reach only a small minority of the population, and only a fraction of those may be persuaded to update their expectations about which party is likely to win the next election. Thus, as indicated, there is a degree of inertia in people's expectations. But along with this inertia, very recent and contemporary events and reports are indeed likely to be incorporated into current expectations.²¹

In addition, individuals may reason that their current evaluations of the parties are likely to be shared by others. For example, a Labour identifier dissatisfied with his party's leaders and policies to the point of expressing a preference for the Tories may quite reasonably believe that other Labourites feel the same way (and that Conservatives, on the other hand, feel good about their party) and—as a consequence—feel that his party's electoral prospects are quite poor. The correspondence over time of voting intentions and expectations may thus be the result of a quite sophisticated treatment of political information.

Of course, simple projection may occur as well, as voters unconsciously align their expectations with their preferences. To this degree, also, expectations will mirror the current proportions intending to vote for each party. Unfortunately, it may be impossible ever to separate these processes completely, even with individual-level data. We can show quite convincingly, however, that what we are tapping goes well beyond that kind of projection. ²²

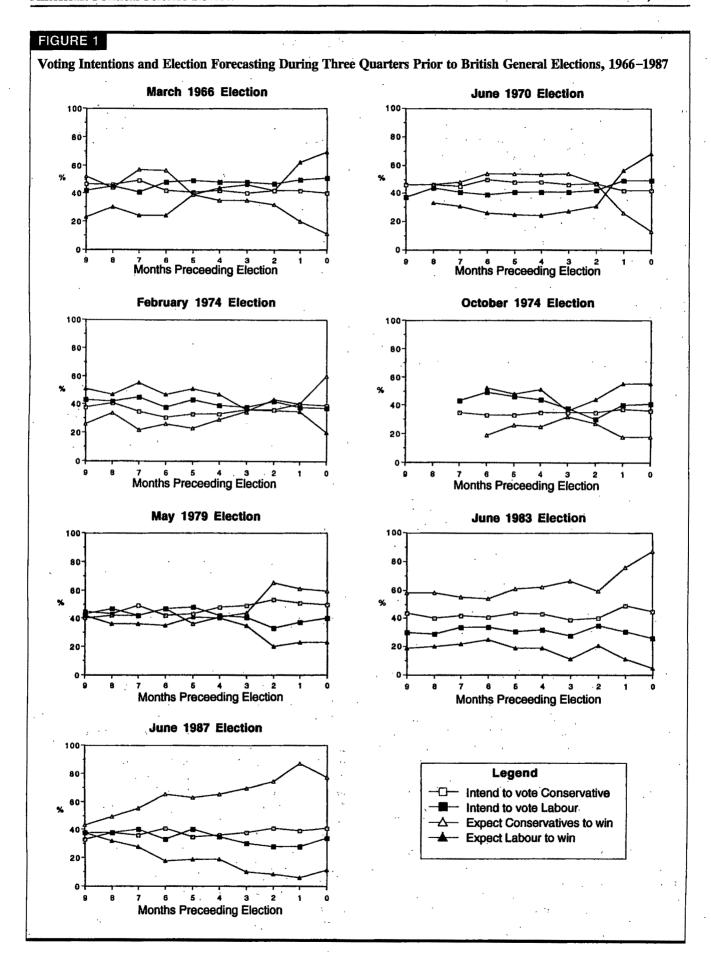

A hypothesis of simple projection would make no allowance for variations between election and interelection periods. But there are, as noted, strong theoretical reasons to believe that the process of forming expectations will have a different character in the neighborhood of the forthcoming election. First, as election day approaches, information about the parties' standings becomes a cheap and easily available commodity. Second, the incentive to use this information increases, as some voters might want to engage in tactical voting. If the degree of connection represents more than mindless projection, the electoral period should be characterized by a more pronounced disconnection between preferences and expectations as voters adjust their views about party's winning chances more quickly and more sensitively to relevant political information than in more quiet, nonelection times.

That wishful thinking is harder to maintain as the

election approaches can be seen in Figure 1, which show the relationship between voting intentions and expectations during the nine months prior to each of the general elections in Britain between 1966 and 1987. In every case, one finds the expected disconnection between votes and expectations, as even loyal partisans are forced to admit that they will lose their electoral bid. The form, duration, and "spread" of the party's chances of winning vary from one election to the other, but the graphs seem to show a consistent pattern, one that would not be evident if projection was the only force at work. To take this pattern into account, we have included an interactive term, PREELECT * VCL_t, 25 to capture the disconnection between preferences and expectations during the electoral period. 26

This disconnection should manifest itself in a positive coefficient for the PREELECT * VCL, variable. To understand this, consider an example in which the Conservatives have the support of 50% of the electorate and Labour the support of 40% during the interelection period (VCL = 10) and in which there is a great deal of wishful thinking. Conservative and Labour supporters alike may suppose their party will win, suggesting a coefficient of approximately 1 between vote intentions and expectations of which party will win, so that net of other influences, WCL should be approximately 10 as well. Now suppose that as the election approaches, there is no change in vote intentions: it is still the case that the Conservatives have the support of 50% of the electorate and Labour the support of 40%. Those who support the Conservatives have no incentive to change their minds about which party should win the election; all 50% should still expect a Conservative victory. However, the connection between vote intentions and expectations should weaken for Labour supporters. Some of the 40%, despite their preference, will concede that the Conservatives are likely to win. This weakening of the connection between preferences and expectations means that a given vote-intention difference between the Conservatives and Labour (VCL remains 10) should translate into a larger proportion of individuals expecting the advantaged party to win (WCL becomes greater than 10); that is, the coefficient of the interaction term should be positive.27

The two remaining variables in the expectations model have similarities to adjustment and inertia components, respectively. First, we include prospective economic thinking because the link between the state of the economy and party popularity has been demonstrated repeatedly by scholars in any number of countries. And inasmuch as these judgments are about the next 12 months, they are less subject to the problems we pointed to earlier in justifying the exclusion of unemployment and inflation variables. In addition, forecasting on the basis of future personal economic situations makes sense both in terms of retrospective and prospective thinking. If one forecasts outside the electoral period, the performance of the economy over the next 12 months is relevant

information, as it will influence the judgments of retrospective thinkers in a forthcoming election. In electoral periods as well, prospective perceptions are relevant as one may hypothesize that other voters evaluate the performance of the incumbent government in terms of the future.28

Finally, what might be regarded as another form of inertia would manifest itself when a political party was able to establish a reputation as a winner. This reputation can develop from the subtle interplay of consecutive victories, ²⁹ the opposition's weakness, ³⁰ leadership strength, ³¹ and past accomplishments. ³² These requirements seem to have been met during the second mandate of Margaret Thatcher as voters perceived her party as the likely winner of the next election even in light of poor showings in contemporary polls. This winner's reputation component is tapped in our model by a dummy variable equal to 1 for this period. 33 As this variable intends to capture a phenomenon that is clearly specific to the expectations formation process, namely the rigidity of expectations under particular circumstances, it is not included in the vote equation. This does not mean that rigidity is without consequences on the parties' standing, as it will have an impact through the WCL variable in the vote equation.

RESULTS

Tables 1 and 2 show our main results. 34 With respect to vote intentions (Table 1), the first point is that the mix of economic and political variables in equation 1, along with the lagged dependent variable, appear to form an appropriate group of control variables to assess the feedback effect of expectations on voting intentions. Our strategy was to devise a vote equation that would prevent us from inflating the impact of the expectations variable, and we seem to have accomplished that goal. First, the tests reported in Appendix B for possible misspecification are reassuring on this point. Second, our results are sufficiently in accord with theoretical expectations and with other empirical results to suggest that the more standard portion of the equation yields a reasonable account of vote intentions sans expectations.

As in most models of party support, for example, a lagged or autoregressive effect is clearly significant and sizable (e.g., Mishler, Hoskin, and Fitzgerald 1989).35 That some—but not necessarily all—economic factors are significant is a common result (Clarke, Mishler, and Whiteley 1990, 69-80; Mishler, Hoskin, Fitzgerald 1989, 231; Norpoth 1991, 151–52). Likewise, other studies have found only small effects of minor-party variables, whereas comparative leadership evaluations have been found to be substantial (Clarke, Mishler, and Whiteley 1990, 71; Mishler, Hoskin, and Fitzgerald 1989, 231). There are some differences between our results and those of other studies, but they are most likely attributable to different definitions of the sample period or to differences in variable definitions.

Assuming, then, that our model is a reasonable one, we find a relatively small but clearly statistically significant effect of expectations on voting intentions. Every 10-point gap between the percentages thinking that the Conservatives rather than Labour will win the next election contributes one point to the electoral margin itself. Since 20-to-30-point gaps are not infrequent even in the interelection periods (see Figure 1) and since the margin of vote intentions is often fairly small, such an impact is far from negligible. Of course, one should not overestimate the bandwagon effect either. Even in the weeks immediately prior to the election, when the expectation gap may reach as high as 50-60%, the change in WCL from the interelection period may only account for an additional two or three percentage points. Moreover, as we shall shortly note, expectations themselves are highly dependent on vote intentions.³⁷ Nonetheless, it is clear that the bandwagon effect, while relatively small in

magnitude, may be of no small consequence in a closely contested election.

Turning to the expectations equation, we noted earlier that there was less certainty about how to formulate it properly. As a consequence, all of the findings are of interest. Overall, the results (Table 2) indicate that the expectations formation process (1) exhibits both significant inertia and adjustment components, (2) reflects the voters' ability to translate expected economic conditions into political forecasts, and (3) is "time-bounded," possessing special effects both before and after the electoral period.

First, note the strength of the inertia effects. To a greater extent than vote intentions, expectations about which party will win depend on prior expectations (i.e., the lagged dependent variable). An exception is in the months immediately following an election, in which the negative coefficient for the interactive term, postelect * WCL_{t-1} , means that voters recognize that the next election is a long way off and that it may therefore have little in common with what has just transpired. The consistent ninepoint bulge toward the Conservatives during the 1983–87 period suggests that there may be some long periods in which one party has a kind of built-in edge. Though additional time and data are required before we can explore this effect more thoroughly, we suspect that it may take on different forms in different times and places. 38

Next note that despite these multiple sources of inertia, winning expectations are also subject to several sources of adjustment. As anticipated, there is a strong connection between current vote intentions and expectations. A 10-point gap in the proportions presently intending to vote for the two parties typically translates into a more than 13-point difference in which party is expected to win. During the months immediately preceding an election, this effect is boosted, by the coefficient on the PREELECT * VCL. interaction term, to nearly a 25-point difference.

As noted, it is not possible completely to disentangle the degree to which the effect of VCL represents rational adjustment to contemporary information or blind projection. But the strength of the interaction term means that voters are able to disconnect themselves to a significant degree from their basic partisan loyalties when they perform political forecasts in the neighborhood of a forthcoming election. At least in the context of relative informational clarity of the immediate preelection period, losers as well as winners generally reach the same conclusion about the identity of the likely winner of the next election.

Finally, the significant coefficient for personal economic experiences, PEXP, indicates that election expectations, like vote intentions, are tied to projections of future economic conditions. In general, optimistic economic forecasts boost the incumbent's expected chances of reelection. While the precise form of this relationship may vary from time to time, the general message is that voters are able to link economic forecasts and expectations much as they link economic forecasts with their own vote intentions.

CONCLUSION

Heretofore, most evidence about the interplay between election preferences and expectations has been derived from the study of American primary elections. The emphasis has been on the effects of expectations on preferences, as well as on the role of week-to-week events and of publicity in the mass media (Abramson et al. 1992; Bartels 1987, 1988; Brady and Johnston 1987; Shanks et al. 1985). This emphasis makes considerable sense in the context of primary elections, in which the contests are between individuals, not parties, the candidates are often poorly known at the start, and elections are held on a rolling basis.

Though some of the same forces are obviously at work, one cannot readily generalize from these studies of American primaries to the nature of expectations in general elections. Therefore, we developed a model to fit the latter circumstances. In doing so, we placed greater emphasis on the effects of preferences on expectations and on the nature of the expectations-formation process in less intense, interelection times as well as during election periods.

Our findings show, first of all, that the expectations-formation process takes on a different character during interelection times. Similarities exist between the electoral period and more quiet times (inertia exists throughout, and the economic forecast and winning reputation variables remain unchanged) but there is a major disconnection between voter preferences and expectations in the neighborhood of an election. Particularly revealing is the preelection adjustment (PREELECT * VCL_t). It may be tempting to interpret the quick adjustment component (VCL_t) simply as a manifestation of what Bartels called "the resilience of projection . . . even in situations where objective cues about the shape of political reality are quite powerful" (1987, 811). Indeed, the fact that only the intensity of the electoral campaign introduces a strong reality check lends credence to the idea that most of the time, most of the people think that future outcomes will move in the direction of their own preferences. But the larger, combined effect of aggregate preferences and simple projection (and whatever other psychological mechanisms link current preferences and expectations) in periods close to the election tells us that reality rapidly takes over when the election is actually in sight.39

Our findings also reveal the contemporaneous nature, even during interelection periods, of the effect of vote intentions on expectations and vice versa. Before they were even completed, much less publicized by the media, the outcomes of polls of vote intentions were already internalized by respondents and reflected in the degree to which they thought that one party held the advantage going into the next general election. Likewise, the anticipated election outcomes had already influenced, though to a smaller degree, those same vote intentions.

While the contemporaneous impact of vote intentions on expectations is consistent with the notion of a simple projection effect, it also suggests how readily available is information about party popularity and related matters. Despite the little attention that ordinary voters pay to political matters, the aggregate movements studied here appear to reflect an ongoing awareness of and reaction to the political world. More generally, the results are also consistent with the view that people accommodate political information quickly and efficiently.

In making much the same point, Lewis-Beck and Skalaban suggested that about all that voters needed to perform competent electoral forecasts was "regular membership of the [American] polity" (1989, 153). Our own work goes one step further by suggesting that voters use quite simple forecasting rules, weighting, when it is relevant, the burden of the past (the winning reputation component) with current facts and evaluations about who they support, what they expect their future financial situation to be, and when the next election will occur.

With respect to vote intentions, our finding of a bandwagon effect, even though small, adds support to the contention that some voters respond to the implicit bonus of being on the winning side even in

high-salience general elections. Bandwagon effects have been found primarily in U.S. presidential primaries (Abramson et al. 1992, 64-65; Bartels 1988; Skalaban 1988, 136-50), but as noted, those elections represent a very different setting from most electoral situations. In British studies, evidence consistent with bandwagon effects has been found, but the absence of panel data made it impossible to distinguish with certainty between bandwagon and projection effects (McAllister and Studlar 1991, 736). And in a Canadian study, there was almost no evidence of bandwagon effects (Johnston et al. 1992). It may well be that their small size not only makes bandwagon effects difficult to detect but that they are sometimes swamped by other election factors. At any rate, the existence of a bandwagon effect in our study suggests that in the future, properly specified popularity functions should include an expectations term whenever possible.

Finally, the results of the overall model are refreshing from a normative point of view. They indicate that many among the "losers" are able to make reasonable forecasts without being in turn heavily influenced by this disappointing outcome. That so many losers recognize themselves as such and nevertheless stick to their preferences is refreshing in that it strongly suggests that under normal circumstances voters are expressing preferences and not simply following the crowd.

APPENDIX A: IDENTIFICATION AND ESTIMATION OF THE EXPECTATIONS AND VOTE MODELS

This appendix gives details of the identification and estimation of our equations.

Identification

Identification of our model is complicated by the fact that we have a system of equations that is nonlinear in the variables. In particular, the expectations equation contains a current endogenous variable on the right-hand side that enters in both an additive and an interactive fashion. It is well known that the usual necessary-and-sufficient rank condition for identification of linear structural equations needs to be amended in this context (Achen 1986, 141–44; Greenberg and Webster 1983, 230–33; Kelejian and Oates 1989, 304–19). Fortunately the required rank condition is a simple extension of the linear case.

In a general linear simultaneous-equations model with G endogenous variables, the rank condition requires that for each equation in the system rank $(A \Phi) = G - 1$ where $A = [\Gamma B]$ is a matrix comprised of the coefficients on the endogenous and exogenous variables in the system and Φ is a conformable matrix representing the exclusion restrictions present in the system. In the linear-in-the-variables case, we require that the endogenous variables enter the A matrix

(through Γ) additively. This rules out models like ours where the A matrix contains an interactive term due to the specification of the expectation equation. However, a simple extension of the rule rank $(A \Phi) =$ G-1 will cover our nonlinear-in-the-variables case. (For a general proof see Fisher 1966, chap. 5). Provided we include the nonlinear function of the endogenous variable as an additional column of A- Γ , we can continue to use the rule rank $(A \Phi) = G - 1$ to check the identification status of the model. In more practical terms, provided we treat the interactive term in the expectations equation as an additional endogenous variable holding constant the number of rows of $A = [\Gamma B]$, it is simple to check the identification status of our expectations and vote equations. The reader will find that both our equations are overiden-

Estimation

The estimation of our model is a relatively straightforward application of two-stage least squares—an instrumental-variables method in which the "instrument" is simply the predicted value of the endogenous variable(s) from a reduced-form regression equation. As with the identification procedure, estimation is slightly more complicated when the model is nonlinear-in-the-variables. In the linear simultaneous equations model the instrument is formed by regressing each endogenous variable in the model on all exogenous variables in the system. In the nonlinear case the instrument is often formed by regressing each endogenous variable on all the exogenous variables plus a set of polynomials and interactive terms in the exogenous regressors (see, e.g., Achen 1986, 142-43). We computed the instrument by the standard method, eschewing the more complex nonlinear-in-the-variables reduced form (although we tried this specification and it made little difference in the results). A justification for our choice of procedure can be found in Kelejian and Oates 1989, 319-24. Provided the nonlinearity is not too severe (and our reduced-form estimates indicate that this is the case), the linear approximation in the instrument equation will not cause problems in formulating the instrument.

As noted, the actual estimation procedure is twostage least squares, which is simply a particular form of instrumental variables. The asymptotic theory that underlies estimation and inference in linear and nonlinear expectations models can be found in Pagan 1984, 1986. Our model is a variant of Pagan's (1984) model 2 with some additional attention being paid to the nonlinearity. Standard asymptotic theory on the convergence of the normalized moment matrix of regressors and the cross-moment matrix of regressors and disturbances leads to consistency results in the location (slope) parameters. As is standard, the residuals are calculated from the original variables leading to consistency for the scale (variance/standard error) parameter. Proofs are straightforward and can be found in Pagan 1984, 227-29 (the linear model) and Pagan 1986, 523-30 (the nonlinear model). The diagnostics, which indicate that our specification is sound, can be found in Appendix B.

APPENDIX B: DIAGNOSTIC TESTING **PROCEDURES**

To check for general adequacy of our model specification we used the diagnostic testing procedures advocated by Spanos (1986) and applied in political science by Granato (1991). The PC-GIVE package provides a series of regression diagnostics designed to alert one to general model misspecification. The tests provided include RESET tests for functional misspecification, a Lagrange multiplier test for general patterns of serially correlated errors, a test for ARCH (Autoregressive Conditional Heteroscedasticity) patterns in the residuals, a test for general heteroscedasticity in the residuals (the "White" test), and a test for residual normality. Because we are operating in a simultaneous-equations framework, we use the residuals based on the original variables, not their predicted values. The relevant statistics based on these residuals converge to the chi-squared distribution, as do their single equation counterparts (Spanos 1986, chaps. 25-26). The substantive aspects of our regression diagnostics follow.

First, our model appears to be well specified: the RESET test for both vote and expectation equations indicates that there is no obvious misspecification in terms of functional form or omitted variables. The relevant statistics fall well below conventional levels of significance ($\chi_5^2 = 3.30$ for the expectations equation, and $\chi_4^2 = 1.53$ for the vote equation).

Second, serially correlated errors do not plague our analysis: given that our model includes a lagged dependent variable, the standard Durbin-Watson statistic is not very meaningful. A more appropriate and general test is the Lagrange multiplier test. Using PC-GIVE, we performed a joint test on lags 1-7 of the autocorrelation coefficient. The resulting statistics fall well below conventional levels of significance (χ_7^2 = 1.49 for the expectations equation, and $\chi_7^2 = .22$ in the vote equation). Additional evidence confirming the absence of serial correlation can be seen by looking at the magnitude of the autocorrelation coefficients at lags 1-7. No estimated coefficient is larger than .20, and most of them are in the -.05 to .05 range.

There does appear to be extremely mild heteroscedasticity for the expectations equation $(\chi_{13}^2 = 22.96)$ significant at the .05 but not at the .01 level) and no visible traces of it in the vote equation $(\chi_{16}^2 = 14.56)$. The evidence on lack of heteroscedasticity, while not quite as good as that on autocorrelation, seems to be reasonable.

Finally, both the expectations and the vote equations have residuals that pass a χ^2 test for normality ($\chi_2^2 = 1.40$ for expectations and $\chi_2^2 = 5.61$ for vote). In summary, model diagnostics indicate that our

two-equation model is theoretically well specified,

does not have serious problems in the stochastic component, and possesses residuals that are normally distributed.

Notes

We would like to thank Kirke Lawton for excellent technical assistance. We also wish to thank Neal Beck, Helmut Norpoth, and William Keech for their comments on a draft of this article.

- 1. The voting intention question is, "If there were a General Election tomorrow, how would you vote?" The expectations question is, "Regardless of how you are going to vote yourself, which party do you think is most likely to win the next general election?"
- 2. The expectations question was asked irregularly (mostly in months just preceding an election) from 1945 to 1973. Since 1975, it has been asked every month except seven months after the 1979 elections and five months after the 1987 elections. We limit our attention to the period starting in January 1976 and ending in June 1987, for two basic reasons: (1) including the period after the 1987 election would have been demanding in econometric terms as it would have created a second string of missing data; and (2) since the popularity function of the British parties has been extensively studied for different subperiods up to the end of the second mandate of Margaret Thatcher, it will be easier to specify a satisfactory vote equation, a preliminary condition in any study about the links between votes and expectations. On the popularity function, see Clarke, Mishler, and Whiteley 1990; Mishler, Hoskin, and Fitzgerald 1989; Norpoth 1991; Sanders, Ward, and Marsh 1991.
- 3. The original expressions of both preferences and expectations are categorical rather than thermometers measuring intensity of feelings and estimated probabilities. In addition, we have available only aggregate rather than individual-level preferences and expectations (though aggregate data may well be better than individual data, as noted in Kramer 1983 and Lewis-Beck and Skalaban 1989, 153).
- 4. We shall sometimes use the terms votes and votes equation rather than the more precise but longer terms voting intentions or popularity function. Similarly, we shall use expectations about future elections and election forecasts interchangeably.
- ably.
 5. We formulate the model in terms of general elections. So far, the most intense scrutiny of expectations formation has been in U.S. primary elections. We discuss the differences between those models and our own in the conclusion.
- 6. VCL, WCL, LEADERS, and MPSHARE are taken from Butler and Butler 1986 updated to 1987 from the Gallup Poll Monthly. UNEMP and INF are taken from the Organization for Economic Cooperation and Development's Main Economic Indicators: Historical Statistics. PEXP is taken from the Gallup Poll Monthly. As indicated in n. 2, WCL was unavailable for seven months during the period under study. We estimated our models both with and without fitted values (computed from the model's parameters) for the missing data and obtained nearly identical results in terms of the parameters and the goodness-of-fit measures. Results with fitted values are reported here.
- 7. For the purposes of estimation, the endogeneity of WCL_t and VCL_t poses a problem when they appear as explanatory variables in the vote and expectation equations, respectively. For this reason, an instrumental variable in the form of a predicted value is created when either variable appears on the right-hand side of our equations. See Appendix A for details.
- 8. Inclusion of both objective conditions and personal expectations has been common in the popularity function literature in Great Britain ("A Computer's Election Advice," *Economist*, 17 August 1991, 53; Clarke, Mishler, and Whiteley 1990; Sanders, Ward, and Marsh 1991). Some work on U.S.

- presidential popularity argues in favor of including only retrospective (Beck 1989) or only prospective (MacKuen, Erikson, and Stimson 1992) economic variables. Our interest here is not in testing these alternative views but to take reasonable precautions against overestimating the effects of expectations.
- 9. How do you think the financial situation of your household will change over the next 12 months? (Get a lot better, Get a little better, Stay the same, Get a little worse, Get a lot worse). Following Clarke, Mishler, and Whiteley 1990 and Sanders, Ward and Marsh 1991, we operationalized the variable as the percentage difference between the first two categories (a lot better or a little better) and the fourth and the fifth categories (a little worse or a lot worse).
- 10. Note also that both variables (as well as the subjective perception and the LEADERS variables) were designed in accordance with a reward-punishment model. To do so, "we reverse the sign of unemployment and inflation during Conservative governments thereby predicting that the Conservative . . . [lead] will increase both: a) as inflation and unemployment rise during Labour governments and b) as inflation and unemployment decline during Conservative governments" (Mishler, Hoskin, and Fitzgerald 1989, 224). Note finally that the rival hypothesis, the issue priority model, was also examined. (We also checked the possibility that the Tories may have benefitted from an "incumbency effect" by adding a dummy variable taking the value of 1 for the two Conservative mandates. It was not significant.) A useful summary of the differences between the issue priority model and the standard reward-punishment model is Clarke, Stewart, and Zuk 1986, 127-30. See also Kiewiet 1983; Kiewiet and Rivers 1984; Mishler, Hoskin, and Fitzgerald 1989, 222-24; Peffly 1984.
- 11. Retrospective perceptions about both personal and general economic conditions, as well as a variable measuring prospective perceptions about general economic conditions, were also examined.
- 12. Lafay, in a French study, follows a rather similar practice by introducing the popularity index of the prime minister in an equation for the popularity function of the president (1991, 135). Micro analyses also show that evaluations of party leader performance in Britain have independent effects on party support (see Clarke, Stewart, and Zuk 1986; Graetz and McAllister 1987). For evidence that leader images in Britain affect not only short-term intentions such as voting but also long-term intentions such as party identification, see Clarke and Stewart 1984.
- 13. There has been a debate about the magnitude and form of the impact of the Falklands War on parties' standings. Consequently, we tried various specifications for this variable and selected the best one using standard criteria. We think it likely that our simple dummy variable, together with the LEADERS variable, adequately takes into account the immediate Falklands War effect and its lasting impact through the sustained popularity of Mrs. Thatcher. On the debate over the war's effects, see Clarke, Stewart, and Zuk 1986; Clarke, Mishler, and Whiteley 1990; Norpoth 1987a and b; Sanders, Ward, and Marsh 1991.
- 14. Specifically, one would write down a structural model of the economy and use all the variables in the system to help predict the expected value of the endogenous variable of interest. Technically, this would impose a series of nonlinear cross-equation restrictions between the "reduced form" equation and the "expectations" equation. This is not the strategy we pursue here, for reasons outlined in the text.
- 15. This would be especially true if the data were "difference-stationary" rather than "trend-stationary." However, in our model only the inflation variables might reasonably be viewed as a difference-stationary process (but see Ostrom and Smith 1993).
- 16. First, the component satisfaction with the prime minister is basically retrospective. Second, the question about the opposition leader is also retrospective in that it does not ask the respondent to think about the opposition leader as a potential prime minister. Third, the two components do not tie the leaders together in an explicit inquiry about their comparative

potential as future prime minister. The question, "Who would make the best prime minister?," followed by a list of potential leaders, would perhaps be a better choice in an expectations equation, but it has not been asked on a regular basis. An example will illustrate these various points. In December 1985, satisfaction with Prime Minister Thatcher was 39%, with Kinnock at 47%; yet when asked who would make the best prime minister, Thatcher received the support of 33%, Kinnock of 24%.

- 17. Our expectations model is consistent with the argument outlined in Beck 1991. Beck argues that one ought to think of economic forecasts as conditional expectations where the conditioning variables include competence, administration, and other political variables. He goes on to criticize the strong rational-expectations approach in the popularity-function literature (e.g., Chappell and Keech 1985; Chrystal and Peel 1985) and presents empirical evidence indicating that such a model is suspect. (See also the criticisms of the rational-expectations approach in Hudson 1982, chap. 3.) We believe that our expectations model, which is more than an adaptive expectation but less than the economists' rational expectations, is an appropriate forecasting model.
- 18. This approach is similar to that used in studying presidential popularity functions, in which some account needs to be taken of changes in administrations. See, e.g., Beck 1991, 91, n. 11).
- 19. The high correlation between current intentions and expectations (.80 for the period under study) supports the view that individuals update their views about the likely winner of the next election very quickly, even continuously.
- 20. Evidence about the availability of poll results can be found in Butler and Kavanagh 1987. Evidence about public exposure to polls for the elections under study here can be found in McAllister and Studlar 1991, 725.
- 21. Indeed, to exclude VCL_t from the equation would require, instead, that we include variables representing sources of all the new information used to form the voter's current vote intention. It is likely, of course, that some voters are sufficiently insulated from contemporary information that they seldom update their understanding of voting intentions. Our argument is that on balance, the most immediate measure of vote intentions (i.e., at time t) is a superior predictor of current expectations. We tested this reasoning, however, by trying an alternative specification in which VCL_{t-1} replaced VCL_t. The resulting coefficient was not significant despite the high correlation (.78) between the two vote measures.
- 22. In fact, if simple projection from one's own vote intentions were the only process involved, then only individual-level VCL would be appropriate in the expectations equation. However, our interpretation is much broader. As we noted, individuals probably feel that their current evaluations are shared by others, but surely they do not think that everyone else views the parties identically. Thus, it seems fully justifiable to include aggregate-level VCL in the expectations equation. The interaction of VCL with PREELECT is also a strong indication that aggregate VCL belongs in the expectations model.
- 23. We expand our time frame here because data for nine months prior to each election are available for the longer period.
- 24. Note that voters put great reliance on polls to form their expectations even if they were misleading, as in 1970 and 1974.
- 25. Do the additive variable PREELECT and the variable POSTELECT (introduced earlier) need to be included as well for proper specification? Not only is it unnecessary always to include each of the components of an interactive term (see, e.g., Lewis-Beck 1980, 54–56), but it is relatively meaningless in this case, as the correlation between PREELECT and PREELECT * VCL is .93, and that between POSTELECT and FOSTELECT * WCL is .63. As to the choice of which variables to include (additive or interactive), theory clearly suggests the interactive form. If two parties are perceived as having exactly the same support, there is no reason to believe that the type of "blips" illustrated in Figure 1 will occur (as a dummy variable

would suggest). Moreover, a dummy variable would imply that these blips will have the same magnitude whatever the vote difference between the main contenders. An interaction term is more flexible, as it allows the sudden increase of "nonprojecting" voters to be linked to the closeness of the election.

- 26. Throughout, the election period is operationalized as the two months preceding an election as well as the electoral month itself (with a slight adjustment in 1979, when the election was on 3 May). Though electoral campaigns as such are shorter than that in Great Britain, rumors and polling activities justify this definition. The graphs show that the election effect does not occur smoothly over the interelection period but rather abruptly in the neighborhood of a forthcoming election—presumably under pressure of the unmistakable realities of the electoral campaign, the enhanced attentiveness of the public, and the decreased likelihood that time will permit a trailing party to rebound significantly. The uniqueness of the electoral context also explains the abruptness of the postelection adjustments we have discussed.
- 27. That a comparable interaction term would be negative in a model of individual vote decisions is entirely consistent with our argument, as it is precisely the weakening of projection effects (during election periods) among those who are likely losers that will generate the widening of the gap between preferences and expectations illustrated in Figure 1 and in the example in the text.
- 28. We checked for a possible interaction between time (operationalized both as one year before the election or not and number of months until the next election) and PEXP and found it not significant; perhaps the effect of this variable is about the same in election and nonelection periods precisely because it can be relevant for both retrospective and prospective reasons.
- 29. The two consecutive victories by Margaret Thatcher followed a period during which the incumbent party had been defeated four times out of six (1964, 1970, 1974, and 1979). Moreover, her 1983 victory was the most impressive one in the postwar period both in terms of seats and the popularity gap with Labour. Conversely, Labour's performance in this election was the poorest one in seats and popular support for the same period.
- 30. Labour was perceived during this period as much more divided than the Tories. In fact, in all the surveys during Thatcher's second mandate, the percentage of respondents perceiving Labour as a divided party outnumbered by extremely large margins the percentage of those thinking of it as united (-55 on average). The Tories were basically perceived as a united party for the same period, with exceptional and short periods of negative balance. (see Gallup Poll Monthly).
- 31. The high personal popularity of Thatcher, as well as the Tory's advantage in questions about the best leaders, speak to this point (see *Gallup Poll Monthly*).
- 32. The victorious Falklands War, the decrease of the inflation rate, and the economic recovery are possible candidates here.
- 33. That we found out-of-sample confirmatory evidence of the rigidity of expectations during Thatcher's third mandate buttresses our confidence that the type of inertia measured by our winning reputation variable is a genuine characteristic of expectations. Moreover, a preliminary inspection of the data after the Conservatives' fourth consecutive victory in 1992 apparently shows less rigidity, which is also consistent with our hypothesis that a string of victories is a necessary—though not a sufficient—condition to produce rigidity in expectations.
- 34. R² is estimated as 1-Regression Sum of Squares/Total Sum of Squares.
- 35. Should we formally test for integration of order one (I(1)) or a "stochastic nonstationarity" in the data series? We feel that such integrated behavior is highly unlikely, given the departure of our lagged coefficients from unity and the fact that our data are rates or ratio-type variables. For a discussion of this point and some general problems with the unit root methodology involved, see Cochrane 1991, 207–9.

36. The reported effect of the Falklands variable may seem small compared to other work. However, it is important not to lose sight of two facts. First, the results will be different depending on the definition of the dependent variable. The war had a different impact on Thatcher's approval rate (immediate and lasting) from what it did on the Tories' popularity (immediate but rapidly declining). Second, the results will be greater if the approval rate of Thatcher is excluded from the

regressors rather than included, as here.

37. In addition, we tested for the possibility that bandwagon effects were greater in the period immediately prior to elections (by including an interactive term, PREELECT * WCL). The coefficient was not significant. Following Norpoth, we also checked the possibility that electoral campaigns drive disenchanted partisans back to the governing party (1991, 150-51); we did so by adding separate dummies for the electoral periods under study. None of these variables was

significant.

38. For example, in a Canadian study, a simple counting variable denoting the number of consecutive polls in which a given party had led in preelection polls was important. We tried such a variable here, but it was not significant (perhaps because of the much greater time between polls, which meant that winning streaks were probably remembered less well, and, in any event, were not so long lived (in terms of numbers of polls) as those in Canada. We also tried a variable measuring the proportion of times during the last six months in which the Conservatives were leading in the polls, but it was not significant (see Johnston et al. 1992, chap. 7).

39. Sometimes, reality becomes overwhelming, and "almost everyone" correctly forecasts the election result, as in Britain in 1983 (see Figure 1) or in the U.S. elections of 1964 and 1972 (Lewis-Beck and Skalaban 1989, 148). Of course, even in the case of a landslide, there will be some "true believers." Moreover, a more adequate measure of expectations (0-100 scale) would probably capture projection effects not visible with the measure we have available; for example, in the U.S. presidential election of 1964, a staunch Republican might have given Goldwater a 25% chance of winning, while most others would have given him close to a 0% chance.

40. These authors also point out that British work on this topic has produced conflicting results; see McAllister and Studlar 1991, 724. That work has often been based on simple comparisons between election results and public opinion polls conducted during the campaign.

COLLECTIVE IDENTITY FORMATION AND THE INTERNATIONAL STATE

ALEXANDER WENDT Yale University

The neorealist—neoliberal debate about the possibilities for collective action in international relations has been based on a shared commitment to Mancur Olson's rationalist definition of the problem as one of getting exogenously given egoists to cooperate. Treating this assumption as a de facto hypothesis about world politics, I articulate the rival claim that interaction at the systemic level changes state identities and interests. The causes of state egoism do not justify always treating it as given. Insights from critical international relations and integration theories suggest how collective identity among states could emerge endogenously at the systemic level. Such a process would generate cooperation that neither neorealists nor neoliberals expect and help transform systemic anarchy into an "international state"—a transnational structure of political authority that might undermine territorial democracy. I show how broadening systemic theory beyond rationalist concerns can help it to explain structural change in world politics.

The collective action problem dominates world politics. The state is often thought to solve it in domestic society by forcing or socializing people to identify with the common good, but the problem seems endemic to the anarchic world of international relations, where each state reserves the right and the force to do as it pleases. Realists and idealists have long debated the conditions under which states can overcome this problem, the former taking a materialist line that power and human nature preclude significant cooperation, the latter arguing that knowledge and institutions make it possible. The discussion has become very sophisticated, with neorealists and neoliberals today dissecting the effects of pursuing relative versus absolute gains, the shadow of the future, transaction costs, and so on (Baldwin 1993).

An important but neglected feature of the recent debate is the shared belief that collective action should be analyzed in terms of Mancur Olson's (1965) definition of the problem, which takes self-interested actors as constant and exogenously given and focuses on the selective incentives that might induce them to cooperate. This reflects the rationalist strategy of explaining behavior in terms of changing prices or constraints, rather than tastes (Stigler and Becker 1977). While some neoliberals have questioned the assumption of state egoism (Keohane 1984, 120-32; see also Lumsdaine 1993), few treat state interests as endogenous to interaction. They either bracket the formation of interests, treating them as if they were exogenous, or explain interests by reference to domestic politics, on the assumption that they are exogenous, although not necessarily constant (e.g., Moravcsik 1992). In both cases, the effect on systemic theory is captured by what Jeffrey Legro (1993) calls the rationalist "two-step": first interests are formed outside the interaction context, and then the latter is treated as though it only affected behavior. This can be merely a methodological presumption, but given its pervasiveness in the current debate it may also be seen as an implicit hypothesis about world politics: systemic interaction does not transform state interests.

Neoliberals make things hard for themselves by accepting this constraint, and their efforts to explain cooperation under it are admirable. But it also brackets an important line of argument against realists, namely, that through interaction, states might form collective identities and interests, redefining the terms of Olson's problem altogether (Calhoun 1991). We cannot know, a priori, which argument is more appropriate. A rationalist approach makes sense when state interests really are exogenous to interaction, which is sometimes the case. When they are not, however, it may ignore important possibilities and/or strategies for cooperation, as well as misrepresent the latter's dynamics.

It would be useful to discuss potential anomalies for the rationalist hypothesis, but ultimately it can only be assessed against its rival, which has not been adequately articulated in the literature. With a view toward theoretical pluralism, my goal herein is to formulate such a rival by reframing the collective action problem among states in terms that make interests endogenous to (or part of the problem in) interaction. In so doing, I hope to put in sharper relief the underappreciated implications of a rationalist assumption (exogeneity).

I draw on two literatures for this purpose. The first is integration theory, which focuses on the formation of community at the international level. Moribund since the early 1970s, it is undergoing a revival today, thanks in part to neoliberals (Keohane and Hoffmann 1991). Collective identification is an essential variable in this theory, however, since without changes in identity the most we can expect is behavioral cooperation, not community (Deutsch et al. 1957; Lasswell 1972; Russett 1963). A rejuvenated "sociology of international community" will therefore ultimately have to go beyond a rationalist vocabulary (Linklater 1990). This exists in what is variously called critical, reflectivist, or *constructivist* international relations scholarship (see Keohane 1988; Wendt 1992). Con-

structivists are interested in the construction of identities and interests and, as such, take a more sociological than economic approach to systemic theory. On this basis, they have argued that states are not structurally or exogenously given but constructed by historically contingent interactions.²

In building a bridge between these two literatures I take a state-centric approach, which integration theorists have often avoided in the past because of its emphasis on anarchy. I do so for two reasons. First, notwithstanding the growing importance of nonstate actors in world politics, states remain jealous of their sovereignty and so may resist collective identification more than other actors, which poses a harder case for theory. Second, I argue that collective identification is an important condition for the emergence of "international states," which would constitute a structural transformation of the Westphalian states system. In effect, constructivism shows how the concern of integrationist theorists with the formation of community can be addressed from a state-centric perspective and the latter thereby made into a critical theory of world politics.

I shall define my dependent variable—forms of identity and interest—then briefly discuss some causes of state egoism at various levels of analysis, arguing that none justifies treating it as given. I shall then sketch a "pretheory" of collective identity formation among states and, finally, suggest how this points to an internationalization of the state, with implications for the states system and democratic theory.

IDENTITY AND COLLECTIVE ACTION

Constructivism is a structural theory of the international system that makes the following core claims: (1) states are the principal units of analysis for international political theory; (2) the key structures in the states system are intersubjective, rather than material; and (3) state identities and interests are in important part constructed by these social structures, rather than given exogenously to the system by human nature or domestic politics. The second claim opposes realism. The third opposes systemic theories that are rationalist in form, whether they are "as if" theories that bracket interest formation, or unit-level, "reductionist" ones (Waltz 1979) that say interests "really are" exogenous. The result is one form of structural idealism or "idea—ism". 3

The claim that states are socially constructed can take various forms. In an effort to avoid an oversocialized approach, I distinguish between the corporate and social constitution of state actors, which parallels the distinction between the "I" and the "me" in symbolic interactionism (Mead 1934). In both cases, I argue that interests are dependent on identities and so are not competing causal mechanisms but distinct phenomena—in the one case, motivational, in the other, cognitive and structural—and, as such, play different roles in explaining action.

Corporate identity refers to the intrinsic, self-organizing qualities that constitute actor individuality. For human beings, this means the body and experience of consciousness (Schwalbe 1991); for organizations, it means their constituent individuals, physical resources, and the shared beliefs and institutions in virtue of which individuals function as a "we" (Douglas 1986). Corporate identities have histories, but these do not concern me here; a theory of the states system need no more explain the existence of states than one of society need explain that of people. The result is a weak or essentialist social constructionism, but one that still leaves the *terms* of state individuality open to negotiation. (There is no space to defend it here, but for a start, see Leplin 1988 and Wendt n.d.)

The corporate identity of the state generates four basic interests or appetites:

- 1. physical security, including its differentiation from other actors
- 2. ontological security or predictability in relationships to the world, which creates a desire for stable social identities
- 3. recognition as an actor by others, above and beyond survival through brute force
- 4. development, in the sense of meeting the human aspiration for a better life, for which states are repositories at the collective level.⁴

These corporate interests provide motivational energy for engaging in action at all and, to that extent, are prior to interaction, but they do not entail self-interest in my sense, which is an inherently social phenomenon. How a state satisfies its corporate interests depends on how it defines the self in relation to the other, which is a function of social identities at both domestic and systemic levels of analysis.

Social identities are sets of meanings that an actor attributes to itself while taking the perspective of others, that is, as a social object (McCall and Simmons 1978, 61–100). In contrast to the singular quality of corporate identity, actors normally have multiple social identities that vary in salience. Also in contrast, social identities have both individual and social structural properties, being at once cognitive schemas that enable an actor to determine "who I am/we are" in a situation and positions in a social role structure of shared understandings and expectations. In this respect, they are a key link in the mutual constitution of agent and structure (Wendt 1987), embodying the terms of individuality through which agents relate to each other. These terms lead actors to see situations as calling for taking certain actions and thus for defining their interests in certain ways.

Some state identities and interests stem primarily from relations to domestic society ("liberal," "democratic"), others from international society ("hegemon," "balancer"). Foreign-policy role theorists (e.g. S. Walker 1987), as well as more recently a number of neoliberals, have emphasized the domestic (and thus systemically exogenous) roots of state identities. I am interested in showing how state identities may be endogenous to the system but (as we shall see) this is

ultimately an empirical question that depends on the depth of structures at each level of analysis. It is also important to note that the intersubjective basis of social identities can be cooperative or conflictual. What matters is how deeply the social structures they instantiate penetrate conceptions of self, not whether self and other are normatively integrated. The Cold War was a social structure in virtue of which the United States and the USSR had certain identities. These were embodied in "national security worldviews" (in terms of which each defined self and other) and in role positions in a social structure (see Weldes 1993). The content of national interests was in part a function of these structurally constituted identities (as well as of domestic ones). The United States had an interest in resisting Soviet influence in Angola because the Soviets were an enemy and enmity is a social relation.

Social identities and interests are always in process during interaction. They may be relatively stable in certain contexts, in which case it can be useful to treat them as given. However, this stability is an ongoing accomplishment of practices that represent self and other in certain ways (Ashley 1988), not a given fact about the world. Rationalism depends on practices having stabilized identities, which we cannot know a priori.

Collective Identity and Action

The ability to overcome collective action problems depends in part on whether actors' social identities generate self-interests or collective interests. Selfinterest is sometimes defined so as to subsume altruism, which makes explanations of behavior in such terms tautological. Instead, I shall define self-interest and collective interest as effects of the extent to which and manner in which social identities involve an identification with the fate of the other (whether singular or plural). Identification is a continuum from negative to positive-from conceiving the other as anathema to the self to conceiving it as an extension of the self. It also varies by issue and other: I may identify with the United States on military defense but with the planet on the environment. In any given situation, however, it is the nature of identification that determines how the boundaries of the self are

In the absence of positive identification, interests will be defined without regard to the other—who will instead be viewed as an object to be manipulated for the gratification of the self. (Note that this does not preclude action that benefits others, as long as it is done for instrumental reasons.) This can take more or less virulent forms. The neorealist claim that states define their interests in terms of relative gains assumes that states tend toward the negative end of the identification continuum, whereas the neoliberal claim that absolute gains predominate assumes that states tend toward the center (neither positive nor negative identification). In both cases, however, self-interest stems from a particular representation of the

relationship of self to other—from social, not corporate identity. Self-interest presupposes an other.

Though little discussed in recent international relations scholarship, an extensive literature exists on collective identity in sociology, social psychology, philosophy, and even economics (see, e.g., Calhoun 1991; Chase 1992; Jencks 1990; Melucci 1989; Morris and Mueller 1992; Oldenquist 1982; Sen 1985; Taylor and Singleton 1993; Wartenberg 1991).5 It refers to positive identification with the welfare of another, such that the other is seen as a cognitive extension of the self, rather than independent. Because of corporate needs for differentiation, this identification will rarely be complete (although some people do sacrifice their lives for others), but to the extent that it exists, there will be an empathetic rather than instrumental or situational interdependence between self and other (Keohane 1984, 122-123; see also Russett and Sullivan 1971, 851-52). This is a basis for feelings of solidarity, community, and loyalty and thus for collective definitions of interest. Having such interests does not mean that actors are irrational or no longer calculate costs and benefits but, rather, that they do so on a higher level of social aggregation. This discourages free-riding by increasing diffuse reciprocity and the willingness to bear costs without selective incentives, an effect supported by empirical research in various fields (e.g., Caporael et al. 1989; Dawes, Kragt and Orbell 1990). This is hardly surprising: if collective action depended solely on coercion or selective incentives, it would be a miracle that society existed at all. The state itself is testimony to the role of collective identity in human affairs.6

The distinction between alliances and collective security arrangements provides an instructive illustration. Alliances are temporary coalitions of selfinterested states who come together for instrumental reasons in response to a specific threat. Once the threat is gone, the coalition loses its rationale and should disband. In contrast, in collective security systems, states make commitments to multilateral action against nonspecific threats. Collective identity is neither essential nor equivalent to such a multilateral institution but provides an important foundation for it by increasing the willingness to act on "generalized principles of conduct" and diffuse reciprocity (Ruggie 1993a). (Less identification would be necessary in pluralistic security communities, in which the commitment is merely not to settle disputes by war, and more, in amalgamated security communities, in which states join formal unions [Deutsch et al. 1957].) Is NATO merely an alliance or a collective security system? There are good reasons for thinking the latter (Chafetz 1993), but data on collective identification would help us answer this question.

The difficulties of achieving pure collective identity make it unlikely that the motivational force of egoistic identities among states can be eliminated, as the recent debate over the Maastricht Treaty made clear. The tension between particularism and universalism is not specific to international relations, however, being inherent in the relationship of individuals to groups (Brewer 1991; Chase 1992; Wartenberg, 1991). Group membership can be costly to the individual and even lead to his being killed, all the while that it is highly valued. Identification is a continuum along which actors normally fall between the extremes, motivated by both egoistic and solidaristic loyalties. The existence of multiple loyalties is at the heart of the debate over "European identity" and may generate substantial role conflict (Smith 1992). Resolutions of such conflicts are never permanent or fixed, however, and their evolution cannot be studied if we take interests as given. Thus, I am not suggesting that collective interests replace egoistic ones as exogenously given constants in a rationalist model but, rather, that identities and interests be treated as dependent variables endogenous to interaction. This would allow us to treat collective action not merely as a problem of changing the price of cooperation for self-interested actors but as a process of creating new definitions of self.

EXPLAINING SELF-INTEREST IN WORLD POLITICS

States, of course, often do define their interests in egoistic terms. Constructivists would emphasize that these are always in process, sustained by practice, but to the extent that practice is stable, the rationalist assumption that interests are given may be useful. To claim this, however, we need to justify that assumption. I shall briefly examine five explanations for state egoism (three domestic and two systemic), arguing that their strength varies historically and often leaves room for collective identity formation.

Domestic Determinants

Perhaps the most fundamental explanation is that self-interest, even if not presocial, stems from the essential nature of states. One might make this argument with reference to human nature, but more relevant here is corporate nature. In a recent critique of constructivism, for example, Jonathon Mercer (1993) draws on the social psychology of intergroup relations to argue that the mere perception of being in a group is sufficient to generate in-group favoritism and out-group discrimination, suggesting that states are cognitively predisposed to be self-interested when they come into contact. This is an important reminder of the importance of corporate identity and interests in constructing social ones. It does not entail permanent group egoism, however, since the boundaries of the self are not inherently limited to corporate identity and scholars in this same tradition have done important work on the conditions under which groups develop common identities (Gaertner et al. 1993).

Second, states typically depend heavily on their societies for political survival, which may induce them to place societal interests before those of other states and treat the latter as instruments for realizing the former. This is undoubtedly pervasive and reflects a general relationship between dependency and identity formation that I shall discuss. Nevertheless, much depends on the nature of state–society relations. Some states depend more on international than domestic society (Jackson and Rosberg 1982; Wendt and Barnett 1993), while others are embedded in societies in which domestic welfare commitments are projected onto altruistic foreign policies (Lumsdaine 1993) and still others are part of democratic societies that identify through shared norms and political culture. To the extent that the boundaries of society are porous, in other words, states might be propelled toward collective identification by "domestic" factors.

These two arguments come together in a third, which focuses on nationalism, that is, a sense of societal collective identity based on cultural, linguistic, or ethnic ties. Nationalism may be in part "primordial" and thus inherent to societies' self-conceptions as distinct groups. In addition, the dependence of states on their societies may be such that they cultivate nationalist sentiments in order to solidify their corporate identities vis-à-vis each other (Anderson 1983). Nevertheless, the depth and exclusivity of national identities varies greatly. German national identity in 1939 was chauvinist and exclusivist, while today it coexists with a significant European component; Serbian identity has moved in the opposite direction, from coexistence with a Yugoslavian identity to chauvinism. This suggests that how nationalism affects state interests should be treated as an open, empirical issue, not assumed a priori to produce egoism inevitably.

None of this is to deny that these (and other) domestic factors often dispose states to be self-interested. The point is that this is socially constructed and historically contingent, not inherent to stateness. Much the same conclusion follows from a consideration of two systemic determinants of state identity.

Systemic Determinants

Neorealists and institutional idealists might each make systemic arguments for treating self-interest as given. Waltz (1979), for example, argues that anarchies are self-help systems in which states that do not think egoistically will be selected out by those that do. This allows him to assume that surviving states will be self-interested, justifying its treatment for subsequent theoretical purposes as exogenously given. In effect, in Waltz's view anarchy so tightly constrains identity formation that the latter becomes uninteresting, which is how his would-be structuralism begets rationalist individualism (Wendt 1987).

The key to this story is the assumption that anarchies are inherently self-help systems, in which actors do not identify positively with each other's security. I have argued elsewhere that there is no necessary connection between the two (Wendt 1992). An anarchy may be a self-help system, but it may also

be a collective security system, which is not self-help in any interesting sense. Which logic obtains depends on conceptions of self and other; an anarchy of friends is different from one of enemies. If, because of unit-level factors, states threaten each other's security in their first encounter, then competitive dynamics may ensue, generating egoistic conceptions of self. New anarchies may even be particularly susceptible to such outcomes. But if states bring a friendly or respectful attitude to that encounter, then different dynamics of identity formation may ensue. Anarchic structure explains little by itself; what matters is the identities and interests that states bring to their interactions and the subsequent impact of the latter on the former. Self-help presupposes self-interest; it does not explain it. Anarchy is what states make of it.

In contrast to the realist's Darwinian view of world politics as an asocial "system," institutionalists emphasize the norms and shared understandings that constitute international "society" (Bull 1977). The foundation of this society is the principle of sovereignty. Sovereignty is a social identity, and as such, both a property of states and of international society. Its core is a notion of political authority as lying exclusively in the hands of spatially differentiated states, in which sense it is an attribute of the state implying territorial property rights (Ruggie 1983a). Territorial control is only a "right," however, if it is recognized by other states, in which sense sovereignty is an institution. This institution mitigates the dangers of anarchy, helping states to survive that otherwise might not (Jackson and Rosberg 1982; Strang 1991).

Sovereignty has an ambiguous relationship to selfinterest. On the one hand, it is a highly open-ended institution compatible with a diversity of interests, by virtue of empowering states juridically to determine their own interests and creating a measure of de facto security in which they have the luxury of doing so. This indeterminateness of sovereignty is important to the argument I shall make about the internationalization of the state. On the other hand, an important rationale for sovereignty is to meet corporate needs for security and recognition. Moreover, it does so in a particular way, namely, by defining rigid spatial boundaries between the rights of self and other. Because of the intimate connection between these rights and corporate needs, states may perceive threats to their ability to exercise such rights as threats to their corporate individuality-in effect, conflating social with corporate identity. One might expect this especially in the early days of a sovereignty regime, when states are still unsure whether their rights will be acknowledged by others. This, along with the fact that by accepting sovereignty, states give up the right to protection by others, will tend to promote egoistic over collective conceptions of interest, or "possessive" over "social" individualism (Shotter 1990).

If and when a society of egoistic sovereigns has been created, it will resist redefinition in more collective terms for at least two additional reasons. First, the need for ontological security motivates actors to hang onto existing self-conceptions because this helps stabilize their social relationships. Second, once Waltz's self-help world is in place, it will reward egoism and punish altruism. Thus, even though a states system is self-help only in virtue of intersubjective knowledge, the latter confronts states as a social fact that resists easy change. Nevertheless, sovereignty may also promote collective identity formation in the long run. Like individuals, states do not want to be engulfed by a collective. This concern may be mitigated, however, by being recognized as sovereign, which increases the confidence that others will respect corporate individuality and leaves the decision to join the collective up to each state. In this way, sovereignty may make it "psychologically" possible for states to develop collective attachments (see Wartenberg 1991), paving the way for an internationalization of the state.

To sum up the argument so far, (1) egoistic interests are based on representations of the relationship between self and other and as such are not an essential feature of individuality; (2) these representations are always in process, even if their relative stability in certain contexts makes it possible to treat them as if they were sometimes given; and (3) many factors dispose states toward egoism, but these do not always preclude collective identities. Still, given that international history has produced mostly egoistic states, collective identity formation must start with and overcome that social fact. I turn now to how such an endogenous transformation of Olson's problem might occur.

COLLECTIVE IDENTITY FORMATION AMONG STATES

The forces disposing states toward particularism sometimes confront others disposing them toward collectivism. Collective identities vary by issue, time, and place and by whether they are bilateral, regional, or global. I cannot examine such variations here, nor can I assess the weight of their determinants relative to those of state egoism. Thus, I specifically do not impute any directionality or teleology to the historical process. I shall merely identify some causal mechanisms that, to the extent they are present, promote collective state identities, although their impact may be more lumpy than linear. In view of my concern with endogenizing identity change to systemic theory, I shall limit my focus to factors at the systemic level, even though domestic factors may matter, as well. Some of my arguments will repeat claims made by integration theorists (though here applied to a state-centric framework), while others will reflect general principles of identity formation in "structurationist" and symbolic interactionist social theory. I shall differentiate three types of mechanisms by the causal roles they play (structural contexts, systemic processes, and strategic practice) and address two factors under each. The discussion will again be suggestive rather than exhaustive.

Structural Contexts

The structures of regional or global international systems constitute interaction contexts that either inhibit or facilitate the emergence of dynamics of collective identity formation, and as such they play an indirect causal role. Whereas neorealists define structure in material terms, constructivists emphasize intersubjective structure, while leaving room for the emergent effects of material capabilities.

Intersubjective systemic structures consist of the shared understandings, expectations, and social knowledge embedded in international institutions and threat complexes, in terms of which states define (some of) their identities and interests. They vary in thickness or depth, depending on the density and/or salience of interactions for state actors. Many international relations scholars acknowledge a role for such structures only in cooperative settings, implicitly equating intersubjectivity with normative integration and leaving conflict to be treated in materialist terms. In contrast, I would argue that conflicts are also intersubjective phenomena, partly in virtue or rules shared by the parties (Bull 1977) but especially in virtue of shared perceptions of issues and threat (see Ashley 1987; Walt 1987). The Cold War was fundamentally a discursive, not a material, structure. Whether cooperative or conflictual, intersubjective structures constitute what kind of anarchy states are in: Hobbes's anarchy is constituted by one such structure, Locke's by another, and Kant's by a third. To say that worlds are defined intersubjectively is not to say they are malleable, however, since intersubjective constructions confront actors as obdurate social facts. Sometimes structures cannot be changed in a given historical context. My idealism is that of Durkheim and Mead, not Pollyanna and Peter Pan.

Intersubjective structures help determine how much "slack" exists in a states system for dynamics of collective identity formation to develop. The greater the degree of conflict in a system, the more the states will fear each other and defend egoistic identities by engaging in relative gains thinking and resisting the factors that might undermine it. In a Hobbesian war of all against all, mutual fear is so great that factors promoting anything but negative identification with the other will find little room to emerge. In the Lockean world of mutually recognized sovereignty, however, states should have more confidence that their existence is not threatened, creating room for processes of positive identification to take hold. The ability of states to create new worlds in the future depends on the old ones they created in the past.

Intersubjective structures give meaning to material ones, and it is in terms of meanings that actors act. British nuclear capabilities were a very different social fact for the United States from Soviet nuclear capabilities. Nevertheless, material structures can have sui generis effects on collective identity formation.

On the one hand, within a conflictual intersubjective context actors will tend to infer intentions from capabilities, such that the latter may become emergent sources of insecurity (Jervis 1978). The deployment of SS-18s by the USSR was a new threat to the West, even though its meaning was a function of the Cold War. To this extent, material capabilities may be part of the problem in a conflict, inhibiting the emergence of positive identifications. On the other hand, material structure can facilitate the latter when it provides incentives for collective problem solving (as Dan Deudney [1993] argues with respect to nuclear weapons) or is sufficiently asymmetric that powerful states can coerce weaker ones to identify with them (Ikenberry and Kupchan 1990; Wendt and Barnett 1993). Such coercion may produce hegemony in the Gramscian sense, but hegemony is a form of collective identity, one less easily created when material power is equally distributed.

Systemic Processes

Structures are always being reproduced or transformed by practice and thus are not static background conditions for collective identity formation. To the extent that practice does reproduce them, however, they merely inhibit or facilitate collective identity formation. The remaining factors have more direct causal impacts. By systemic processes I mean dynamics in the external context of state action. Both of these arguments are long-standing liberal ones. My point is that they relate to identity, not just behavior—a point lost in neoliberalism's rationalist "two-step."

The first process is rising interdependence. This can take at least two forms. One is an increase in the "dynamic density" of interactions due to, for example, trade and capital flows (Buzan 1993; Ruggie 1983a). A second is the emergence of a "common Other," whether personified in an external aggressor or more abstract threat like nuclear war or ecological collapse (see Lasswell 1972, 24). While the one generates "dilemmas of common interests" and the other "dilemmas of common aversions" (Stein 1983), both increase the objective vulnerability and sensitivity of actors to each other (Keohane and Nye 1987) and, with these, the thickness of systemic structures. This reduces the ability to meet corporate needs unilaterally and increases the extent to which actors share a common fate. These changes in the context of interaction will sometimes affect only the price of behavior (as rationalism assumes), but they may also change identities and interests. Indeed, dependency, whether intersubjective or material, is a key determinant of the extent to which an actor's identity is shaped by interaction, which is why a child's development is normally far more influenced by its parents than by others actors. As the ability to meet corporate needs unilaterally declines, so does the incentive to hang onto the egoistic identities that generate such policies, and as the degree of common fate increases, so does the incentive to identify with others. As interdependence rises, in other words, so will the

potential for endogenous transformations of identity, with consequences that go beyond those analyzed by rationalists.

A second systemic process that may encourage collective identity formation is the transnational convergence of domestic values. This can take place in various issue areas, but two of the most salient are cultural (the rise of global consumerism) and political (the spread of democratic institutions, welfare statism, concern with human rights, etc.). Societal convergence can result from rising interdependence, in which case, its effects will be hard to separate from the latter. But it may also stem from demonstration effects, diffusion, and "lesson drawing" (in which one society learns from another that one form of social organization is "better" than another). The effect is to reduce the heterogeneity (or increase the similarity) among actors. As with interdependence, this change in the interaction context may sometimes affect only behavior, but it may also change identities and interests. As heterogeneity decreases, so does the rationale for identities that assume that they are fundamentally different from us, and the potential for positive identification increases on the grounds that "they're no different from us, and if it could happen

Despite the incentives that rising interdependence and societal convergence may create to adopt more collective forms of identity, however, neither is a sufficient condition for such a result. The vulnerabilities that accompany interdependence may generate perceived threats to self-control, and rising similarity may generate fears that the state has no raison d'être if it is not different from others. States may respond to these systemic processes, in other words, by redoubling their efforts to defend egoistic identities. (This may be one reason why students of intergroup relations have found that increased contact alone does not ensure cooperation.) The key to how states deal with the tension between corporate fears of engulfment and the growing incentives for collective identification, therefore, lies in how they treat each other in their changing interaction context.

Strategic Practice

In the last analysis, agents and structures are produced or reproduced by what actors do. Systemic structures and processes may affect the context of interaction, but specific actions are rarely dictated by them. Actors sometimes act as though they were in a "game against nature", but more interesting here is strategic practice, in which others are assumed to be purposive agents with whom one is interdependent. This is, of course, the traditional province of game theory, which normally does the rationalist "twostep" of treating identities and interests as exogenous to interaction. Without minimizing the usefulness of game-theoretic models when identities and interests are stable, I want to suggest that more is always "going on" in strategic interaction than such models convey, namely, the production or reproduction of

identities and interests. When these change as a result of interaction, game-theoretic models will misrepresent the possibilities for, and mechanisms of, cooperation. In what follows, I shall focus on two forms of interaction differing in their form of communication: behavioral and rhetorical.

The first argument involves a constructivist rereading of Robert Axelrod's (1984) "evolution of cooperation." Taking an iterated, two-person prisoner's dilemma as his model, Axelrod shows how a strategy of reciprocity, or "Tit for Tat," can generate behavioral cooperation. This process becomes attenuated in the n-person case of interest here, where it is harder to target specific others and so may only work in small or "k-groups" within a larger context (Olson 1965). But the general logic is transportable: through repeated acts of reciprocal cooperation, actors form mutual expectations that enable them to continue cooperating. Like Olson, however, Axelrod's basic model assumes that actors remain egoistic,8 and as such that interaction only affects expectations about others' behavior, not identities and interests. This gives the argument greater generality, applying to pigeons as much as to people, but it brackets the possibility that interaction may transform the interests constituting a game.

In contrast, if we treat identities and interests as always in process during interaction, then we can see how an evolution of cooperation might lead to an evolution of community. This can occur as an unintended consequence of actions carried out merely to realize self-interests or as a result of a conscious strategy of collective self-transformation (Gamson 1992, 60). Repeated acts of cooperation will tend to have two effects on identities and interests. First, the symbolic interactionist concept of "reflected appraisals" suggests that actors form identities by learning, through interaction, to see themselves as others do (Berger and Luckmann 1966; Mead 1934; Rosenberg 1981). The more significant these others are, as measured by the material and/or intersubjective dependency of the self upon them, the faster and deeper this process works. By showing others through cooperative acts that one expects them to be cooperators too, one changes the intersubjective knowledge in terms of which their identities are defined. Second, through interaction actors are also trying to project and sustain presentations of self (Goffman 1959). Thus, by engaging in cooperative behavior, an actor will gradually change its own beliefs about who it is, helping to internalize that new identity for itself. By teaching others and themselves to cooperate, in other words, actors are simultaneously learning to identify with each other—to see themselves as a "we" bound by certain norms. As with Axelrod's argument, this process may be attentuated in an n-person context, but the fact that humans do associate in communities suggests that repeated interaction can transform an interdependence of outcomes into one of utility.

Many examples of such transformations might be cited, but a particularly apposite one here is John

Ruggie's (1983b) analysis of the postwar free-trade regime as "embedded liberalism." In keeping with its rationalist basis, conventional regime theory treats the rules, norms, and principles defining regimes as external constraints affecting merely the price of behavior. Ruggie shows that the free-trade regime does more than this, having institutionalized in statesociety relations new state identities and interests that conform to the regime, in effect creating new subjects of international relations. Insofar as these define a transnational community of interest, states have incentives for compliance that go beyond the transaction costs of defection. The evolution of such a community can only be explained, however, if we examine the effect of practice on identities and interests.

The discussion so far has focused only on the potential effects of strategic behavior on identities and interests, and as such it is consistent with the concept of a noncooperative game in game theory. This may be realistic in situations where actors do not have available more direct forms of communication (as in the prison of the prisoner's dilemma), but this is not typically the case. What might be called rhetorical practice may have effects similar to those of behavioral practice but it does so through a different mode of communication, variously enacted as consciousness raising, dialogue (Offe and Wiesenthal 1980), discussion and persuasion (Caporaso 1992, 614-6), education, ideological labor (Hall 1986), political argument (Plotke 1992), symbolic action (Johnson 1988), and so on. Despite differences, all of these processes presuppose that the social world is constituted by shared meanings and significations, which are manipulable by rhetorical practices. These practices may involve power, but of the "third-dimensional," rather than the "first-dimensional" kind (Lukes 1974); that is, they are efforts to change others' conceptions of their interests. The goal of rhetorical practices in collective action is to create solidarity; thus they may have an important expressive function independent of their instrumental value in realizing collective goals.

A good part of the "action" in real-world collective action lies in such symbolic work. When leaders of the G-7 hold annual but substantively trivial meetings to discuss economic policy, when European statesmen talk about a "European identity," when Gorbachev tries to end the Cold War with rhetoric of "New Thinking" and a "common European home," when Third World states develop an ideology of "nonalignment," or when the United States demonizes Saddam Hussein as "another Hitler," states are engaging in discursive practices designed to express and/or to change ideas about who "the self" of self-interested collective action is. These practices may ultimately serve an instrumental or strategic function, but they cannot be understood from a strictly rationalist standpoint, since they are at base about redefining identity and interest.

Rival Hypotheses

There is nothing inevitable about collective identity formation in the international system. It faces powerful countervailing forces, and I do not mean to suggest that the logic of history is progressive; there are too many examples of failed collective identities for that. My point is only that to the extent that mechanisms are at work that promote collective identities, models that ignore them will understate the chances for international cooperation and misrepresent why it occurs. In that sense, my argument is a rival to the rationalist hypothesis about collective action. The precise nature of the rivalry depends on how the latter is formulated—whether as the claim that egoistic state interests are, in fact, given and constant (which instructs us to ignore the formation of interests) or as the claim that states might develop collective interests but only as a result of domestic factors (which leads to reductionism about state interests). Despite the differences between these claims, both treat interaction as affecting only the price of behavior and thus assume that a rationalist research agenda exhausts the scope of systemic theory. My rival hypothesis is not merely that states might acquire collective interests (which dissents from realism) but that they might do so through processes at the systemic level-which dissents from rationalist versions of systemic theory, realist or liberal. Indeed, by focusing on the systemic origins of collective identity, I have made systemic rationalism rather than realism my primary target.

Which hypothesis is more appropriate in a given context is an empirical question that may change over time. Two strategies for comparison suggest themselves. One would avoid the direct measurement of identities and interests and focus instead on testing the different behavioral predictions of the two models about how much collective action should occur, and, taking into account problems of revealed preference, on that basis infer whether interests are collective or egoistic. A problem with this strategy is that it is difficult to specify exactly how much collective action even a well-worn theory like Olson's would predict (Green and Shapiro 1994). This strategy also tells us little about the process and causes of collective identity formation. Thus a second strategy would be to focus more directly on identities and interests as the dependent variable and see whether, how, and why they change. The challenge here, of course, is to construct measures of state identity and interest capable of sustaining inferences about change, which I cannot take up here (see Wendt, n.d.).

THE INTERNATIONAL STATE

This essay so far has been a creature of the "anarchy problematique" (Ashley 1988), which theorizes about states in anthropomorphic terms as purposive actors interacting under anarchy. Despite my "sociological"

departure from the dominant "economic" vocabulary, like rationalists I treat states as agents having identities, interests, rationality, and so on. There are important objections to this analogy (Ferguson and Mansbach 1991, 370), but I believe it is legitimate for many purposes (Geser 1992; Wendt n.d.). It becomes problematic, however, if it so dominates our thinking that we automatically treat whatever is external to territorial state actors as "not-state" and therefore anarchic. This may obscure the emergence of state powers at the international level that are not concentrated in a single actor but distributed across transnational structures of political authority and constitute a structural transformation of the Westphalian states system. Collective identity formation is an essential aspect of such a process.

All but the most hard-core neorealists would probably say that the international system is characterized by "particles" of governance and that as such it is not a pure anarchy (compare Waltz 1979, 114–6). With the deepening and proliferation of international institutions, these particles are rapidly becoming "sediment." There is widespread agreement that this does not represent a move anytime soon toward centralized authority on a "domestic analogy" (Bull 1977), but neither does it represent a persistence of anarchy, since it does involve authority and "governance" (Rosenau and Czempiel 1992). This suggests that the anarchy-hierarchy dichotomy that has organized the field for so long is problematic (Milner 1991) and opens the door to new thinking about the foundations of international politics.

In response to this challenge, some scholars advocate non-state-centric thinking on the assumption that the concept of the state is inherently tied to centralized authority (Ferguson and Mansbach 1991). In contrast, other emphasize the mutability of state forms, differentiating the state from sovereignty and even territoriality (Ruggie 1993b; R. Walker 1990). One way to develop this latter suggestion would be to define the state as, at base, a structure of political authority that performs governance functions over a people or space (Benjamin and Duvall 1985; Katzenstein 1990). The enactment and reproduction of this authority structure may or may not be centralized in a single actor. In the Westphalian system, state agents and authority structures did coincide spatially, which leads to the familiar billiard ball imagery of "states" (actors, under which authority structures are subsumed) interacting under anarchy. But the two concepts need not correspond in this way: political authority could in principle be international and decentralized (Ruggie 1983b; Pasic 1993). Following Robert Cox, we might call such transnational structures of political authority that lack a single head "international states" (1987, 253-65).10

The concept of authority has a dual aspect: legitimacy (or shared purpose) and coercion (or enforcement) (Ruggie 1983b, 198). This suggests that the internationalization of the state requires the development of two qualities: identification with respect to some state function, be it military security, economic

growth, or whatever and a collective capacity to sanction actors who disrupt the performance of that function. The result of such developments would be an institutionalization of collective action, such that state actors would regard it as normal or routine that certain problems will be handled on an international basis (Nau 1993). This expectation is likely to be expressed and met in various ways: norms, rules, and principles that define expectations for behavior; routine discussions of collective policy; and interorganizational networks among bureaucratic agencies (Geser 1992; Hopkins 1978). By themselves, these forms are not international states, but to the extent that they manifest and contribute to collective identity and enforcement, they will be part of an internationalization of political authority.

This is present today in various degrees among advanced capitalist countries in both security and economic issues. The provision of security (and more specifically the maintenance of a territorial monopoly on organized violence) is a key function of the state. "Monopoly" normally refers to control by a single actor, but it can also denote control by multiple actors if they are not rivals and engage in institutionalized collective action. A collective security system is just that—joint control of organized violence potential in a transnational space. Such control with respect to external security has long characterized NATO, and recently European Community states have begun to internationalize internal security as well (Den Boer and Walker 1993). This system has a high degree of legitimacy among its members, as well as some capacity for enforcing its policies on them. It is based on multilateral norms that give even its weakest members a say in decisions (Risse-Kappen 1991), its leaders routinely formulate policies together, and its militaries are linked organizationally for both operations and procurement. Its capacity for institutionalized collective action is certainly also lacking in many respects, as the recent difficulties of defining a European defense policy attest, but the internationalization of political authority is a continuum, and NATO is far from anarchy along it.

The provision of an institutional framework for capitalist production is another function of the state that is today being internationalized. Historically, capitalism was largely a territorial phenomenon, in which capitalists could direct their political efforts toward corresponding domestic authorities. As competition drove them to expand overseas through trade and investment, however, they created a demand for international rules and regulations. State actors responded with a network of regimes: a trade regime to govern the flow of goods and services; a monetary regime to govern the value of transactions; and, increasingly, a "capital regime" to govern property rights and capital flows (Duvall and Wendt 1987). Today these regimes do more than merely affect the prices of certain behaviors; they embody a degree of collective identity ("embedded liberalism"), routinized discussions of collective policy, and networks of interorganizational linkages. Their principal weakness remains enforcement, but even here there are emerging sanctioning systems that enable us to speak of an internationalization of political authority with respect to global capital (Cox 1987).

Let me emphasize that I am not saying that international state formation has gone very far, any more than has the formation of collective identities that is one of its prerequisites. It is a process, and even if it continues we are only in its early stages. It is issuespecific (though it may "spill over" into new issue areas), mostly regional in nature, and a matter of degree. Moreover, there are strong arguments for thinking that it will not continue, since it creates fundamental tensions between the national and transnational responsibilities of state actors (Taylor 1991). My point is merely to suggest some ways of thinking about certain dynamics in the contemporary world system that do not privilege the dichotomy between anarchy and hierarchy in statist theory (or its counterpart of intergovernmentalism versus supranationalism in integration theory). The key to such thinking is recognizing that political authority need not be centralized, a point recognized implicitly long ago by the integrationists and, since the neorealist interregnum, it is being rediscovered by a variety of scholars today (Pasic 1993). To be sure, centralization or supranationality may facilitate an internationalization of political authority, and the latter may even create some incentives for it. But one might also argue that decentralized governance arrangements will facilitate the process, since by preserving the forms if not substance of sovereignty, they may pose less tangible political threats to state actors against which resistance might coalesce.

The internationalization of political authority has at least two broad implications for international relations theory. First, it points toward a gradual but structural transformation of the Westphalian states system from anarchy to authority. The basis of that system is the institution of sovereignty, which constitutes an anarchy of mutual recognition. Even when international state formation does not involve the formal cession of sovereignty to supranational institutions, it does relocate individual state actors' de facto sovereignty to transnational authorities. The result in practice might be a "disarticulated" sovereignty in which different state functions are performed at different levels of aggregation (Pogge 1992), and/or a "neo-Medievalism" in which political authority is shared by both state and nonstate actors (Bull 1977, 254-94). Either way, the result is neither anarchy nor hierarchy but the emergence of a new form of state—and thus states system—which breaks down the spatial coincidence between state-as-actor and state-as-structure. Thus the erosion of individual state sovereignty does not imply the erosion of the state. Sovereignty is not an intrinsic feature of state agency but one social identity a state may have. By transferring it upward to a collective, states may actually strengthen their capacity to solve problems. Internationalization is a way of reorganizing and

redeploying state power, not a withering away of the state.

A second implication is how this calls into question the premises of contemporary democratic governance. The Westphalian approach to sovereignty allowed democratic and international relations theorists to ignore each other. The former were concerned with making state power democratically accountable, which Westphalia constituted as strictly territorial and thus outside the domain of international relations theory; the latter were concerned with interstate relations, which were anarchic and thus outside the domain of political theory. Under this worldview, democrats could celebrate the "end of history" with hardly a peep about democracy at the international level.

The internationalization of the state makes this silence problematic. 11 As state actors pool their de facto authority over transnational space, they remove it from direct democratic control. Territorial electorates may still retain the formal right to "unelect" their leaders, but the ability to translate this right into tangible policy change (versus merely changing the faces in power) is constrained by the commitments that state elites have made to each other. New elites could in principle break those commitments, but often only at the cost of external sanctions and reductions in their own effectiveness (Dahl 1993). Various interpretations of the threat this poses to territorial democracy can be imagined. The current debate in the European Community over the "democratic deficit" (Williams 1991) treats it in largely liberal terms as one of controlling an emerging centralized power, but radical democratic theory might be more relevant for the more decentralized authority structures cropping up all over the international system. In either case, the attempt to solve international collective action problems by creating collective identities among states creates an entirely new problem of making those identities democratically accountable, a problem ultimately of transforming the boundaries of political community (Linklater 1990; Wolfe 1992). Solutions might take transferritorial or functional-corporatist forms but will somehow have to expand "the people." In contrast to their splendid isolation in the sovereignty regime, democratic and international relations theorists might want to work on this one together.

CONCLUSION

It is widely thought that state-centric systemic international relations theory cannot explain structural change and so ought to be abandoned. In my view, the problem lies not with statism but with two other commitments that inform contemporary understandings of structural theory: realism and rationalism. The essence of the former is materialism, *not* a willingness to confront the ugliness of world politics as its proponents would have it. If system structure is reduced to a distribution of material power, structural change can mean nothing more than shifts in polarity that

will not end the dreary history of conflict and despair over the millennia (but see Deudney 1993). Since authority is an intersubjective concept, the nature and implications of its internationalization will elude a materialist theory. The essence of rationalism, in contrast, is that the identities and interests that constitute games are exogenous and constant. Rationalism has many uses and virtues, but its conceptual tool kit is not designed to explain identities and interests, the reproduction and/or transformation of which is a key determinant of structural change. We should not let our admiration for rationalist methodology dictate the substantive scope of systemic international relations theory (Shapiro and Wendt 1992).

Scholars should not ignore the state as they grapple with explaining structural change in the late twentieth century, but for their part, statists should recognize that when states interact, much more is going on than realism and rationalism admit. Yes, international politics is in part about acting on material incentives in given anarchic worlds. However, it is also about the reproduction and transformation-by intersubjective dynamics at both the domestic and systemic levels—of the identities and interests through which those incentives and worlds are created. Integration theorists appreciated this suggestion long ago, but their nascent sociology of international community has been lost in the economics of international cooperation developed by realists and rationalists. The latter has contributed important insights into the dynamics of interaction under anarchy, but is ill-suited as a comprehensive basis for systemic theory precisely because it brackets some of the most important questions such a theory should address. Constructivists bring renewed interest and sharpened analytic tools to those questions.

Notes

An earlier version of this article was presented at the 1993 meeting of the APSA in Washington. The article would not have been possible without the many helpful comments of Emanuel Adler, Mike Barnett, Lea Brilmayer, Mlada Bukovansky, James Caporaso, Martha Finnemore, Mark Laffey, Roy Licklider, David Lumsdaine, James Marino, Jonathon Mercer, Debra Morris, Bruce Russett, Rogers Smith, and seminar participants at Cornell University, Johns Hopkins University, New York University, University of Pennsylvania, Rutgers University, and Yale University; thank you.

- For important exceptions, see Nye 1987 and Jervis 1988.
- 2. For varying expressions of this argument, upon which I draw freely, see Adler 1991; Alker n.d.; Ashley 1987; Katzenstein 1990; Kratochwil 1989; Ruggie 1993b; R. Walker 1990; and Wendt 1992.
- 3. Other traditions of international relations theory that might fall under this heading include poststructuralism, world society theory, neo-Gramscianism, Deutschian integration theory, and perhaps the society of states school. For elaboration of this and other issues discussed in this section, see Wendt n.d.
- 4. For a useful discussion of the importance and nature of basic needs at the individual level see Turner 1988, 23-69.
- 5. As noted, collective identity was a centerpiece of classical integration theory, but the latter's insights have been pushed aside by the realist and rationalist approaches that

- dominate contemporary international relations theory. For recent international relations scholarship that begins to revive the concept, see Alker n.d. 1986; Caporaso 1992, 617-20; Keohane 1984, 120-34.
- 6. Although collective identification operates at the level of social identity, by enhancing the capacity for collective action it can help create corporate identity, which in one sense is simply a (temporarily) "solved" collective action problem. The distinction between the corporate and social identity of groups is therefore itself a construction, signifying the higher self-organization of the former rather than timeless and essential.
- 7. An interesting exception is the rationalist literature on "endogenous preference formation"; see Cohen and Axelrod
- 8. Later in his book, Axelrod discusses the possibility of actors internalizing new interests, but this important point has not been picked up by mainstream regime theorists in international relations.
- 9. Another is Schroeder's (1993) splendid discussion of how the European great powers learned to think in "systemic" (in my terms, essentially "collective") terms in the early
- 10. This concept has been used primarily by neo-Marxists (Cox 1987; see also Picciotto 1991) though see the interesting discussion of Kant's usage in Hurrell (1990). My own thinking on this score, as on many others, owes much to conversations and work with Bud Duvall (see esp. Duvall and Wendt 1987).
- 11. For an early appreciation, see Kaiser 1971; the recent literature includes Connolly 1991; Held 1990; and R. Walker

RESEARCH NOTES

REASSESSING MASS SUPPORT FOR POLITICAL AND ECONOMIC CHANGE IN THE FORMER USSR

ARTHUR H. MILLER, VICKI L. HESLI and WILLIAM M. REISINGER University of Iowa

Ising survey data collected in Russia, Ukraine, and Lithuanian in 1990–92, we reexamine findings reported by Finifter and Mickiewicz (1992). Our analysis indicates a significant link between political and economic reform orientations. Individuals who prefer political reforms of a democratic nature also favor a decreased role of the state in guaranteeing social well-being. In addition, our finding that better-educated Soviet and post-Soviet citizens are more likely than the less-well-educated to prefer individual responsibility for well-being is in direct contradiction to the findings reported by Finifter and Mickiewicz. The differences in the two sets of conclusions give rise to very different substantive conclusions regarding the economic and political changes now occurring in these societies.

inifter and Mickiewicz (1992) present data from a survey of public opinion in the former USSR. They use these data to analyze some of the critical issues in the transition toward new political arrangements, including popular views of whether the state or the individual should be responsible for securing the well-being of the citizenry, as well as popular orientations toward political and economic reform. Their article warrants attention from a wide audience because it presents data from the "first large-scale true personal interview survey in the Soviet Union" (p. 859), because of the centrality of the theoretical issues they address, and because of some unexpected findings. They conclude, for example, that those who have obtained a higher level of education, as compared with the less-well-educated, may be more likely to prefer a strong governmental role in promoting social well-being. They also find significant similarity in the political and economic attitudes expressed by different ethnic subgroups across various republics of the former Soviet Union. Both of these findings are surprising in light of conclusions drawn earlier from the Soviet Interview Project and from research based outside of this region.

Given the importance of the issues that Finifter and Mickiewicz tackle, it is crucial to compare their findings with those obtained from other data so as to prevent preliminary conclusions from becoming accepted as "received wisdom" before they have been verified. Therefore, we reexamine several key arguments put forth by Finifter and Mickiewicz using data both from a series of three large-scale surveys conducted by the University of Iowa and the USSR Academy of Sciences (now Russian Academy of Sciences) in 1990–92 and from American National Election Studies (NES) data, which permit a broader cross-systemic comparison. Based on these analyses, we are able to reinforce and confirm some of their findings, but more importantly, our results contradict

several notable conclusions reached by Finifter and Mickiewicz.

Specifically, our reexamination of these issues demonstrates that the proportion of those who believe that the individual, as opposed to the government, should be responsible for producing social well-being is rather close to the levels found among Americans. The average level of this individualism increased from 1991 to 1992, thereby casting doubt on the argument that 70 years of societywide Soviet indoctrination (although the socialization was admittedly less than fully effective) account for the levels found. In addition, differences in support for individual versus governmental responsibility are influenced significantly by variables (such as income and gender) that Finifter and Mickiewicz found to be unrelated to locus of responsibility and, even more significantly, by variables that they did not even include in their analyses (personal economic situation and rating of the Communist party). Furthermore, the better educated are more likely than the less-well-educated to prefer individual responsibility for well-being over governmental responsibility, thus directly contradicting the findings reported by Finifter and Mickiewicz. Another contradiction involves popular support for political reform, which, contrary to Finifter and Mickiewicz, is influenced by the respondent's nationality. Finally, our data call into question Finifter and Mickiewicz' argument that attitudes toward the locus of responsibility and toward political reform represent distinct dimensions, thereby permitting economic and political reform to move in different directions. Rather, our analyses show strong, positive correlations between the two even when controlling for other key factors.

The discussion and data analysis supporting these contrary conclusions proceed by first examining more fully the concept and measurement of locus of responsibility. Then we turn to testing the four major hypotheses guiding the analysis. The first hypothesis involves reexamining the relationship between edu-

cation and locus of responsibility. Our expectation is that the better-educated will be more supportive of individual responsibility. Second, using a multivariate analysis we investigate the hypothesis that political and economic conditions influence preferences for individual rather than governmental responsibility for well-being. Third, to test the hypothesis that nationality differences are a factor influencing political and economic attitudes, we include nationality as one of the independent variables predicting the locus of responsibility and political reform measures. The expectation here is that attitudes toward political reform should be influenced more strongly by nationality differences than are economic orientations toward the locus of responsibility. Finally, we examine the fourth hypothesis, which involves an expected relationship between attitudes toward political and economic reform.

Our analysis differs from that of Finifter and Mickiewicz in certain respects. Because we have data from only three former republics (Russia, Ukraine, and Lithuania), we cannot fully reproduce their analyses. We can, however, offer a more in-depth understanding and analysis of the relevant hypotheses in these three countries because our sample was designed to be representative of each of these former republics. (See the Appendix for a description of the data.) The Finifter and Mickiewicz sample, on the contrary, was not designed to be representative of particular republics but was supposed to represent the broader Soviet Union. Thus very few respondents were found in any given republic, except Russia. Also, with regard to questionnaire construction, although several of the questions asked by Finister and Mickiewicz were very similar to those asked in the University of Iowa surveys, none of the items that they reported employed exactly the same wording as was used in our interviews. Because specific survey questions are slightly different, we do not reproduce any of their earlier published tables here for direct comparison. We do encourage the reader, however, to make those direct comparisons on their own. Also, to avoid problems associated with attempts to make direct comparisons across individual questionnaire items, we will employ multiple-item scales to tap equivalent underlying concepts. Our time frame is also different: the Finister and Mickiewicz interviews were undertaken only once, at the end of 1989, while our interviews were administered in three annual waves beginning in the summer of 1990 and finishing in the summer of 1992. Because the 1990 survey included fewer survey items relevant to the analysis presented here, we will draw most heavily from the 1991 and 1992 survey data.1

LOCUS OF RESPONSIBILITY FOR WELL-BEING

As Finifter and Mickiewicz note, a core element of socialist ideology involves the locus of responsibility

for social well-being. In order to gauge public support for ideological tenets, we focus on public perceptions of who should be responsible for individual economic well-being: the state or the individuals themselves? Under socialist systems, the state has assumed the major role in caring for individual well-being. As a matter of ideology (and also practice), the socialist state controls property, the means of production, and most aspects of the economy that directly influence one's economic well-being. Socialization within this system, therefore, could be expected to promote both an expectation that the state will continue to provide for social well-being and a preference for the state to assure a high standard of living for every citizen. On the other hand, preferences for individual responsibility are likely to be more prevalent in systems characterized by relatively more laissez-faire market economies. Given these cross-system expectations, the distribution of public attitudes toward the locus of responsibility for the former Soviet Union is of considerable theoretical importance.

The distribution of responses to the question on locus of responsibility for a sample of Russians, Ukrainians, and Lithuanians interviewed shortly before the August 1991 coup attempt and one year later are presented in Table 1. Comparing the responses of the total sample from the 1991 and 1992 studies to those reported by Finifter and Mickiewicz reveals a great deal of similarity. The comparison cannot be made directly, however, because the question asked in our surveys had a middle (pro/con) category, whereas their individual-versus-state-responsibility indicator was dichotomous. But when the percentages for our data are recalculated after excluding the middle category, the distributions are nearly the same as what Finifter and Mickiewicz report. In 1991 only slightly more than half (53.7%) preferred state responsibility and in 1992 the division was virtually the same as the 50.7% found by Finifter and Mickiewicz (see Table 1). Across the three former republics, only Russians displayed a statistically significant, although slight, shift toward individualism between 1991 and 1992. Lithuanians, however, expressed more individualism than did Russians or Ukrainians in both years, thereby confirming a finding reported by Finister and Mickiewicz. Despite the collapse of the Soviet Union at the end of 1991, these attitudes, at least at the aggregate level, appeared quite stable across time. At first glance, therefore, this stability may be attributed to basic, enduring social-

Comparable data from the NES, however, provide a cross-national comparison suggesting that the distribution of preferences may have less to do with ideological indoctrination than with current economic circumstances and realistic judgements regarding what the Soviet state and successor governments could be expected to do under existing economic conditions. The 1988 NES dichotomous distribution excluding the middle category (see Table 1) had 64.1% preferring individual responsibility, signifi-

	46.3	49.3	44.3	49.1	49.2	48.8	55.3	51.1	64.1	55.0

cantly different from the 46.3% found in the Soviet Union for 1991. Moreover, the difference fits with the theoretical expectations for the two countries (i.e., Socialist countries showing the stronger orientation toward state responsibility). The situation changes, however, in 1990, when the United States was in a deep recession and many more people were expressing the feeling that the state, rather than individuals, should provide for social well-being (see Table 1). Clearly the difference between U.S. and Soviet attitudes on locus of responsibility is much smaller when the 1990 U.S. data are used in the comparison.

What is surprising about these data is not the fact that Soviets were so evenly divided between state and individual responsibility for individual well-being but that a relatively high percentage of Soviets (as compared to Americans) preferred an individual solution. After 70 years of assumed socialist indoctrination and a tendency for people to turn to the state for help in periods of economic crisis, we would have expected that a much higher percentage of Soviets would view the state as the preferred provider of social well-being. Of course, given that the distributions in Table 1 rely upon a single survey item to measure locus of responsibility, the critic might be rightfully skeptical of these results. Fortunately, the surveys we are employing as evidence each include several questions designed to measure the concept of locus of responsibility. Therefore, we can expand the analysis and are not limited to a single item (as were Finifter and Mickiewicz). Indeed, an exploratory factor analysis revealed that four items from our 1991 and 1992 surveys formed a cohesive, moderately intercorrelated set of questions that could be used in an index that ranged from strong preferences for state responsibility to strong preferences for individualism.² The set of four items included the variable discussed in Table 1, a question on concerns

about economic inequality, an item measuring preferences for maintaining state or collective property versus the establishment of private property, and a question on attitudes toward "businessmen" (understood in the Soviet context to mean entrepreneurs). The text of the questions are presented in the Ap-

Briefly, the pattern of responses to the three questions not already discussed tends to indicate a slight shift in an individualistic direction between 1991 and 1992. For example, 43% of the total respondents in 1991—as compared with 35% in 1992—felt that economic inequality was a grave danger to social stability. Also, 43% of the 1991 respondents said they had nothing in common with businessmen, whereas in 1992 that figure declined to 40%. On the question of owning property, among the 1991 sample 33% preferred state or collectively owned property, while 31% favored private property (the remainder wanted some combination). In 1992, the data revealed only 26% favoring state-owned property, while 43% preferred private property. This overall shift in the direction of individualism is also clearly evident in the mean value of the four-item locus of responsibility index. (Overall, the mean shifted from 6.72 to 7.13, where high values indicate support for individualism.) The index means also differed across republics. In both years, Lithuanians were more individualistically oriented (7.77 and 7.84 in 1991 and 1992 respectively) than Russians or Ukrainians (means of 6.67 and 6.73 for the two countries in 1991 and 7.07 and 6.83 in 1992), a difference that is not surprising given Lithuania's historically closer ties with Europe and their early movement to secede from the Soviet Union. In 1991, Russian and Ukrainian preferences were not significantly different. However, the most rapid across-time shift in these attitudes occurred among Russians. By 1992, therefore, Russians were more individualistically oriented than Ukrainians.

Source: University of Iowa's Post-Soviet Citizen Surveys.

"The survey question scale initially ranged from 1 = state responsibility to 5 = individual responsibility for economic well-being. Here we have collapsed the scale as follows: 1–2 = state, 3 = pro/con, 4–5 = individual. The U.S. data employed a seven-point scale, so the collapsing was 1–3 = state, 4 = pro/con, 5-7 = individual.

In this collapsing of the initial scale, we eliminated those responding 3 = pro/con and recalculated the percentages, still having 1-2 = state, 4-5 = individual. The U.S. data also eliminated the center category.

Education is dichotomized here into those with secondary education (or less) versus those with more-than-secondary education. $^*p < .001$.

EDUCATION HYPOTHESIS

Our major concern with the Finister and Mickiewicz report, however, is not the distribution of responses to the locus-of-responsibility questions. On the contrary, in the case where we have comparable questions, the estimate of the distribution derived from their data and that presented in Table 1 are very similar. Rather, the major problem is how these attitudes on responsibility for well-being are related to other variables, particularly such demographic variables as education and income.

Most surprising is the negative correlation they find with education, namely, that the better-educated favored state responsibility for well-being, whereas the lesser-educated favored individual responsibility (Finifter and Mickiewicz, 1992, 866). As Finifter and Mickiewicz point out, this negative correlation is contrary to that found earlier with data on Soviet emigres (Silver 1987). In addition, Duch recently found a correlation between education and endorsement of free-market culture variables (1993, 102) that was the opposite of the finding reported by Finister and Mickiewicz (although we are not arguing here that the measures of free-market culture and locus of responsibility are tapping the same attitudes). The negative relationship reported by Finifter and Mickiewicz also runs counter to the correlation obtained with the single-item measure in our 1991 and 1992 data and even contradicts the relationship found with U.S. data (see Table 2). Moreover, the correlation between the four-item locus-of-responsibility index and education is positive and significant (.19 and .15 in 1991 and 1992 respectively). Given this overwhelming evidence, one can only conclude that the better-educated in both the former Soviet republics and in the United States are significantly more likely to endorse individual responsibility for providing a high quality of well-being than are the lesser educated. Thus, the results in Table 2 are not only consistent across time and cross-culturally, but they

better match theoretical expectations than those presented by Finister and Mickiewicz.

The interpretation that Finifter and Mickiewicz brought to the education relationship they found was twofold. First, they argued that the better-educated were really the ones who were benefiting from the material and psychic gratification provided by the Soviet state (1992, 866). Second, the better-educated were altruistically concerned about providing a safety net for the less fortunate in society, so that they were more supportive of the state bearing the burden of providing social welfare for its citizens (p. 867).

The data in Table 2, however, suggest a very different interpretation. It is more likely that the less-fortunate in the former Soviet societies realized their dire need for state support simply to survive. The better-educated, on the other hand, preferred a system that allowed for more individual initiative and entrepreneurship either because of materialistic motivations or because they desired more freedom and self-determination. Since they were more likely to benefit from a system that gave more emphasis to individualism, they were also more willing to accept greater individual responsibility for their own well-being.

ECONOMIC AND POLITICAL CIRCUMSTANCE HYPOTHESES

The analysis presented by Finifter and Mickiewicz, however, went well beyond the correlation of education and locus of responsibility. To explain the variation and differences in locus of responsibility, Finifter and Mickiewicz utilized a multivariate regression analysis (1992, 869, Tbl. 8) incorporating a number of demographic variables and a measure of life satisfaction. A comparable analysis using our 1991 and 1992 data is presented in Table 3 (cols. 1-2, 5-6). As might be expected with a dependent variable that is a multiple-item index and thus is more reliable and has less-restricted variance than a single question, the explained variance for the equations presented in Table 3 is three times the magnitude of that found by Finifter and Mickiewicz. More importantly, only two of the six (excluding ethnicity controls) independent variables included in the equations—age and life satisfaction—exhibit relationships with the locus-ofresponsibility measure that confirm the Finister and Mickiewicz analysis. In both 1991 and 1992, younger Soviets and those with a more positive sense of life satisfaction were more likely than older and dissatisfied people to prefer individual orientations to government responsibility for social well-being. The regression coefficients for these two variables are similar to those displayed by Finifter and Mickiewicz (1992, tbl. 8).

The major discrepancies between the Finister and Mickiewicz study and the data reported here arise with respect to education, gender, income, and ethnicity. The contradiction involving the education relationship was mentioned earlier. It is sufficient,

Note: The locus-of-responsibility index ranges from 1 to 15, where 1 indicates state responsibility and 15 indicates individual responsibility for well-being. Standard errors are in parentheses. b = unstandardized regression coefficient, beta = standardized coefficient. "Better off = high.

therefore, to note that the additional controls for other variables do not change the relationship observed in Table 2; that is, better-educated Soviets favored individual solutions to attaining well-being, while the lesser-educated were more likely to look to the state—exactly opposite to the finding reported by Finifter and Mickiewicz. Furthermore, Finifter and Mickiewicz reported that gender and income had no significant impact on locus of responsibility. The data in Table 4, on the contrary, reveal a consistent and relatively strong effect for gender: in both years, women were more likely than men to favor the state as the provider of social well-being. Likewise, Soviets with lower incomes, particularly in 1992, expressed the stronger preferences for the state as the guarantor of social well-being. Regarding nationality differences, Lithuanians were more supportive of individual responsibility than were Russians and Ukrainians. However, the impact of nationality will become more meaningful when we return to a broader discussion of this variable.

Except for life satisfaction, all the predictors included in the Finifter and Mickiewicz analysis were social-structural variables. As they point out, life satisfaction was included because it has been seen as a cultural attitude that influences the development of political democratization and economic reform (Inglehart 1990). We shall not here attempt to discuss or empirically examine a number of other theoretically relevant political and economic variables that go well beyond the largely demographic variables utilized by Finifter and Mickiewicz. We point out, however, that none of the variables used by Finifter and Mickiewicz indicate the extent to which locus of responsibility

^bPositive = high. ^cSatisfied = high.

 $^{^{}d}$ Male = high.

p < .01.

was a response to recent change in economic conditions. Also, none of their variables are explicitly political in nature, so they failed to capture the potential impact of contemporary political circumstances. In an effort to address these limitations, we shall briefly extend our investigation to an analysis of how public response to the economic and political circumstances of the time may have affected locus of responsibility orientations.

Earlier findings from political-economy research suggest that both economic and political circumstances could potentially influence public attitudes toward the role of government in guaranteeing the basic economic well-being of citizens, as well as support for a particular type of economic system. (For extensive reviews of this literature, see Kiewiet 1983 and Lewis-Beck 1988.) This research implies that perceived changes in national economic circumstances (sociotropic considerations) will influence collective economic evaluations more strongly than personal or "pocketbook" concerns (Kinder and Kiewiet 1979). Additionally, the earlier research suggests that prospective expectations of how economic conditions may develop in the future can influence political and economic orientations as much as retrospective assessments (Fiorina 1981; MacKuen, Erikson, and Stimson 1992; Miller and Wattenberg 1985).

Duch has recently applied these various arguments to an analysis of survey data collected in the former Soviet Union in 1990 (1993, 591). In doing so, he hypothesized that Soviet citizens who were experiencing a deterioration in their own economic situation or perceived the national economy as deteriorating, as well as those who expected these economic failures to continue in the future, would be more likely to support free-market changes because they would blame the command economy for the current and future economic woes. This same argument could be extended to incorporate the impact of economic circumstances on attitudes toward the locus of responsibility. Also, if the Soviet regime was being blamed for economic failures, both national and personal, then we should expect that those citizens who were most negative toward communists should be most supportive of economic reform. We would hypothesize, therefore, that anticommunist sentiment should promote support for an individually oriented locus of responsibility throughout the late 1980s and early 1990s.

However, by 1991—and certainly by 1992, after the collapse of the Soviet Union—the impact of deteriorating economic conditions may have taken a different turn than that hypothesized by Duch (1993). Under *perestroika* (Gorbachev's economic restructuring program), a good deal of lip service was given to new economic freedoms and the encouragement of new entrepreneurship. Indeed, by 1991, there were emerging signs of these changes. For example, citizen-owned cooperatives were starting to spring up. The collapse of the Soviet Union at the end of 1991 also produced a dramatic increase in the possibility for new entrepreneurship. Real economic conditions

continued to deteriorate, but the possibility for individual economic improvement changed significantly during this period. An alternative hypothesis, therefore, is that those who were hardest hit by the collapsing economy needed to look to the state for assistance, whereas those who were actually doing equally well or better during this period, relative to the past, could only hope that they would do even better under a market-oriented, private enterprise system that gave more emphasis to individual responsibility.

The empirical evidence from 1990 to 1992 confirms that this was a period in which former Soviet citizens perceived a dramatic deterioration in their economic circumstances. The percentage of respondents reporting that their personal financial situation worsened "relative to the past year" rose from 40% in 1990 to 56% in 1991 and 61% in 1992. Over this same period, only 8-10% said their economic situation had improved relative to the past. Nonetheless, expectations regarding future economic circumstances actually became slightly more optimistic during this period. In 1990, when respondents were asked to look ahead one year, 63% said they would be worse off in the future. By 1991, respondents giving that pessimistic assessment had dropped to 49% and it fell to 45% in 1992. At the same time, respondents saying they would be better off in the future rose from 7% in 1990 to 11% and 15% in 1991 and 1992 respectively. Likewise, over this period of time former Soviet citizens were increasingly negative in their evaluations of the Communist party. Ratings of the communists became sharply more negative between 1990 and 1991 (rising from 49% to 60% rating communists negatively in the two respective years) and remained predominantly negative through 1992, when 62% rated the communists negatively.

Clearly economic and political circumstances in the former Soviet Union changed significantly between 1990 and 1992—but with what impact on broad economic orientations such as the preferred locus of responsibility? To answer this question and to test the hypotheses we have raised, the regression equations presented in Table 3 were recomputed after adding four new predictor variables to the analysis. The first two items are the retrospective and prospective assessments of one's personal financial situation. The third measure indicates the respondent's judgment of whether the national economy had improved or worsened during the past year, while the fourth measures evaluations of the Communist party on a five-point scale.

The resulting coefficients demonstrate that both personal economic change measures and attitude toward communists had a strong impact on preferred locus of responsibility in 1991 and 1992. Statistically, these new variables contribute nearly 10% more explained variance beyond that provided by the original set of variables in Table 3. The results suggest that changing economic conditions had a major impact on attitudes toward responsibility for economic wellbeing. Between the times when the two surveys were

in the field, Russian president Boris Yeltsin and his administration undertook a series of governmental measures that liberalized prices, ended government subsidies of some industries, and capped some wages. The result was hyperinflation that reduced or eliminated many people's savings and replaced limited supplies of cheap goods with readily available goods that few could afford. To maintain an adequate standard of living for one's family required most adults to scramble for extra income. This new challenge produced tension, fears for the future, and (for some) a higher appreciation of Soviet-era conditions. Those who succeeded in securing adequate income to keep pace with inflation were likely to enjoy the wider range of available goods, but those whose living standards fell were likely to be disillusioned with what is often called "barbarian capitalism." Similar trends were underway during this period in Lithuania and in Ukraine—the latter because its economy was closely interconnected with the Russian economy. For these reasons, we would expect that individual success in surviving harsh economic circumstance would condition one's outlook on market reforms. Indeed, the coefficients in Table 3 demonstrate that Soviets who felt that their own personal economic situation had improved or stayed the same were more inclined toward individualism than those who perceived a worsening situation. Similarly, respondents who were optimistic about future economic improvements were more likely to express support for individual responsibility. Also, those who rated communists very negatively were much more likely to place responsibility for social wellbeing with the individual than were those who rated communists more positively.

An unexpected result revealed by Table 3 is the weak statistical effect for concerns about national economic conditions.³ This finding contradicts those studies arguing that sociotropic concerns generally outweigh the impact of pocketbook concerns. The results obtained here, however, point to an important set of circumstances, relevant to contemporary Eastern European and post-Soviet societies, that condition the relative impact of pocketbook and sociotropic assessments. Because the economic deterioration in these countries has been so widespread and visible, a large majority perceive that the national economy has declined and will most likely decline even farther before it begins to improve again. Under these circumstances, similar to those of a depression in Western democracies, individual survival and opportunity become far more important to each person than concerns about what is happening at the national level. Indeed, by 1991 the perception that the Soviet national economy had worsened during the past year had become almost universal (92% of the survey respondents said it had worsened), thereby providing virtually no explanation for differences in attitudes toward the locus of responsibility. Despite slightly more variance in the 1992 public assessments of the national economic performance in these new post-Soviet countries, 85% of the combined respondents said that the national economy of their country had further deteriorated during the past year. Given such widespread pessimism about the national economy, it is understandable that differences in more immediate, personal concerns are predominant.

Including the personal economic situation variable in the multivariate analysis does more than just demonstrate the strong impact that short-run changes in the economy can have on broader economic orientations such as locus of responsibility. The addition of the personal economic variable also changes the interpretation that can be given to the social structural variables included in the equation. Variables such as age, education, and place of residence (urban/rural) have previously been used by some writers as indicators of longer-term change, such as socialization or modernization effects (see e.g., Hahn 1991; Lapidus 1989). However, each of these indicators can also be expected to be correlated with short-term fluctuations in economic conditions. For example, the quality of life among elderly people on fixed incomes will be influenced far more by rapid price increases than will the life-style of younger people. Having controlled for the confounding effects of recent economic change, the statistically significant social structural variables actually take on increased relevance as indicators of longer-term socialization effects and the impact of social change (e.g., modernization) on the development of individualistic responsibility.

Yet more revealing, however, is the substantial impact of anticommunist sentiment on locus of responsibility. Even without trying to impose a particular causal interpretation on this relationship, it is important because it demonstrates a substantial link between broader economic ideology and political evaluations. Support for the communist system and striving for individualism were clearly at odds. Indeed, a separate analysis for 1991 that went beyond Table 3 reveals that the highest levels of endorsing individualistic effort as the source of well-being occurred among those who were alienated from the all-union government while trusting the republiclevel leadership. Clearly political orientations were among the most important factors affecting locus of responsibility. Moreover, the strong impact of anticommunist sentiment on locus of responsibility demonstrates that materialistic benefits were not the only motivations underlying broader economic orientations.

SUPPORT FOR REFORM: NATIONALITY DIFFERENCES

The inability to confirm the results presented by Finifter and Mickiewicz also extends to their analysis of Soviet attitudes toward political reform, especially as political reform relates to nationality differences. For example, Finifter and Mickiewicz conclude that "Russians, Ukrainians and Balts did not differ very much from each other in the degree of support for

political change" (1992, 862). Yet recent scholarship reveals that major forces for reform came from social and regional groups mobilized on the basis of nationalist symbols, grievances, and demands (Clemens 1991; Lapidus 1992; Motyl 1992).

Our hypothesis, which arises from our earlier work on identities (Miller, Hesli, and Reisinger 1993), is that nationality has a profoundly different impact depending upon the issue or policy area under consideration. More specifically, attitudes that relate directly to political reform can be expected to be more strongly influenced by nationality differences, while orientations related to economic reform and responsibility are less subject to nationality differences. These expectations arise from an understanding that the notion of political reform at the end of the Gorbachev era had clear anti-Soviet-state underpinnings and that support for political change often implied support for a restructuring of the Soviet system of authority. Thus political change became a rallying point for the multiple nationalist movements operating in the period from 1989 through 1991. Economic reform, however, presumably was less closely tied to nationalist aspirations, and a broader range of orientations toward state versus private ownership and economic responsibility should be apparent within national groupings.

To test the hypothesis that the relative impact of nationality depends upon the issue area, we included nationality as one of the independent variables predicting the locus of responsibility and the political change indices. Table 4 reports the distribution of a multiple-item index constructed by drawing from our surveys those items most similar to those employed by Finifter and Mickiewicz. The items include three questions from an agree/disagree battery:

- 1. It is better to live in an orderly society than to allow people so much freedom that they become disruptive.
- 2. These days Stalin is not given adequate credit for building of socialism.
- 3. Political reform in this country is moving too rapidly.

Also included in the index is a rating given of the Communist party, according to the following instructions:

Now we would like to get your feelings toward certain groups using a five-point scale, where 5 indicates a very positive view and 1 a very negative view. You may use any number between 1 and 5 to tell me how favorable or unfavorable your feelings are for each group. If you have difficulty answering, just tell me and we will go on to the next one.

These items were selected because of their internal theoretical consistency: each item represents an important aspect of the reform process. Item 1 corresponds most directly with Finifter and Mickiewicz item q22d, which makes reference to the trade-off between freedom and order. Item 3 corresponds to Finifter and Mickiewicz item q18, which makes specific reference to the pace of change. Item 2 is included because the repudiation of Stalin played a critical role in early efforts to legitimize the new reform effort. The reference to the Communist party is included because the focus of much of the reform effort was the intransigence, corruption, and lack of responsiveness of the Communist party.

It is noteworthy that both Russians and Ukrainians were generally less supportive of rapid change than were Lithuanians. Many of the explanations that have been offered in the literature for the relatively weaker manifestations of perestroika-era nationalism in Ukraine as compared with the Baltic countries, may account as well for the hesitancy of Ukrainians whole-heartedly to support rapid reform (see Armstrong 1990; Laitin 1992; Motyl 1987; and Nahylo 1991). Ukrainians from the eastern and southern regions exhibited levels of assimilation (russification) unmatched anywhere else in the Union, with the possible exception of Belorus. Adoption of Russian as their native language by Ukrainians in these regions was extremely high, while in West Ukraine (which was incorporated late into the Soviet Union during World War II and where most of the nationalists tended to reside) knowledge of Russian was much lower. Thus the majority of the population of Ukraine (found in the southern and eastern regions) were uncomfortable with the demands for radical change emanating from outside of their own region.

As of 1992, however, the republics were independent and formally in control of their own destiny. Following the collapse of the Soviet Union, we might

expect the notion of political change to take on a different meaning—a shift that is suggested by the 1992 data in Table 4. In general, the data reveal a decline, as of 1992, in support for rapid reform (across all three national groups). Nevertheless, even after taking the general trend of declining support for political change into consideration, Lithuanians continued to exhibit stronger pro-reform orientations, thereby contradicting the Finifter and Mickiewicz findings.

Our longitudinal data also fail to support the Finifter and Mickiewicz findings regarding the impact of context on the attitudes of Russians residing in non-Russian republics. At the outset of the 1990s, approximately 24 million Russians lived in the non-Russian republics. This substantial presence of Russian minorities in a variety of places where the culture and climate of opinion is very different from that found in Russia raises the possibility that the local context may have influenced the attitudes of the nonindigenous Russians in a way that would produce preferences that differ from those expressed by Russians in Russia. Indeed Finifter and Mickiewicz contend that their data support the general argument that "the political attitudes of individuals who change their residential locations tend to be influenced by the political and social context into which they move; such individuals tend to change their attitudes in the direction of conformity with their new neighbors" (1992, 864). The evidence they provide in support of this contention is that Russians living in Kazakhstan, Uzbekistan, and Ukraine were very similar to the indigenous nationalities in terms of their attitudes toward political change (see p. 863). Likewise, they conclude that "the Baltic peoples . . . do not differ significantly from Russians in Estonia on support for political change" (p. 864).

Given that we have already demonstrated a similarity between Russians and Ukrainians in 1990 and 1991 in outlooks on the pace of change, the most telling comparisons involve a focus on differences between Russians and Lithuanians. As indicated in Table 4, indigenous Russian and indigenous Lithuanian attitudes toward change do differ, so that it is possible to test a hypothesis that predicts a similarity of attitudes between Russians living in Lithuania and Lithuanian nationals. Among Russians living in Lithuania in 1992, the group mean on the reform index is 4.96. This indicates that Russians living outside of Russia are very similar (as a group) to those living inside of Russia (see Table 4) but are different from Lithuanians. In fact, across all three years, the reform attitudes of Russians living in Lithuania are more similar to those of Russians in Russia than they are to those of titular Lithuanians.

The finding that Russians in Lithuania fail to share the attitudes of indigenous Lithuanians makes a good deal of sense. After all, Lithuanians on the whole were relatively negative toward Russia and Russians, sentiments that stem from their forced entry into the Soviet Union after World War II. Moreover, with independence came increased discussion about ex-

clusionary policies that would make voting and the holding of public jobs dependent on the ability to speak Lithuanian—changes that could limit the opportunities for people who speak only Russian. Russians in Lithuania, therefore, would have good reasons to support slower change and to be concerned about possible social disorder, because they, as a group, would be disadvantaged by rapid change.

In order to assess the impact of nationality on support for reform relative to other potential social cleavages in post-Soviet society, we included nationality and a number of other demographic characteristics in a multiple regression predicting pro-reform attitudes. The particular demographic predictors included in the equations were selected so as to produce a multivariate analysis similar to the one presented by Finifter and Mickiewicz (1992, tbl. 8). Our analysis confirms the Finifter and Mickiewicz findings for a number of the predictor variables, particularly the effects for age, education, and gender on attitudes toward political change (see Table 5). The propensity of younger people to be relatively more supportive of political change is apparent in both 1991 and 1992. These age differences may reflect generational socialization effects, or they may indi-

^bMale = high.

^{*}p < .01.

cate that young people are better able to withstand the traumas of the times and are less negatively impinged on by dramatic changes in the system. Similarly, the more highly educated respondents were consistently more reform-oriented than their less-well-educated counterparts. We agree with the Finifter and Mickiewicz explanation that the principle beneficiaries of the recent political changes have more often been the better-educated sectors of Soviet and post-Soviet society (1992, 866). The results reported in Table 5 also confirm that women have been uncomfortable with the pace and direction of political change. Finifter and Mickiewicz interpret this finding as meaning that women are generally more conservative than men (p. 867). However, as we have previously argued, orientations toward reform are not necessarily a reflection of women being more conservative but rather of women perceiving the changes that are currently taking place as having a disproportionately negative impact on them (see Hesli and Miller 1993).

The rest of the multivariate analysis fails to support the Finifter and Mickiewicz findings. First, it is noteworthy that the power of the demographic variables to explain the variance in pro–reform attitudes drops over the period. The fact that these same variables could explain less variance in pro–reform attitudes in 1992 indicates that political change took on a different meaning after 1991. The decline in explained variance over this period may suggest that socialization and modernization effects were more important predictors of pro–reform attitudes in the early phases of the Gorbachev period but that other factors (presumably more current political and economic forces cutting across demographic cleavages) had greater impact at the end of the Gorbachev era.

Other contradictions involve the significant impact of Lithuanian nationality and the relationship with urban/rural residence in 1991. The Lithuanian case provides support for the hypothesis that even with controls for other demographic characteristics, Lithuanians expressed more support for political change than did Russians or Ukrainians. In addition, the magnitude of the coefficient associated with Lithuanian nationality is greater in Table 5 than in Table 3, indicating a more powerful impact of nationality differences on political rather than economic reform orientations. Place of residence (either urban or rural) also had an independent and significant impact on orientations toward reform in 1991. The direction of the relationship in 1991 indicates that people living in the rural areas were less comfortable with rapid reform than were their urban counterparts. It is noteworthy that the rural residence effect is not operative in 1992. If urban/rural differences can be explained by a simple reference to "greater conservatism in rural areas" (Finifter and Mickiewicz 1992, 868), then rural respondents in 1992 should also be more conservative. A full-fledged explanation of observed differences is beyond our present scope, but let it be said that the particular circumstances of the times must be taken into account when offering

explanations for anti-reform orientations. Rural people cannot in all cases be assumed to be conservative and traditional. (For more on this argument, see Turner et al. 1993).

RELATIONSHIP BETWEEN SUPPORT FOR POLITICAL AND ECONOMIC REFORM

The most telling discrepancy between the Finifter and Mickiewicz findings and our replication, however, does not involve these demographic relationships. Rather, the most important divergence in the two sets of findings involves the relationship between support for political change and attitudes toward the locus of responsibility for economic well-being. Finifter and Mickiewicz report that preferences on political change and broad economic orientations reflect two separate independent dimensions of Soviet public opinion. 6 The implication of this multidimensionality of attitudes, according to Finister and Mickiewicz, is that economic and political change could occur independently of each other and take very different directions, at least if public preferences have a strong impact on changes. Such a finding is not only unexpected but certainly contradicts much of the broader literature on political economy, as well as the suggestions of some analysts of economic change in communist states (e.g., Mason 1992).

To reexamine Finifter and Mickiewicz's finding of no significant relationship between political and economic orientations, we employ data from our 1991 and 1992 surveys. The results resoundingly disconfirm the Finifter and Mickiewicz conclusion that two independent dimensions underlie these attitudes. Our data reveal a strong positive correlation between support for political reform and preference for individualism and a market economy (the Pearson correlation coefficients are .431 for 1991 and .453 for 1992).

However, given that similar demographic variables influence both sets of attitudes, the correlations might be spurious. A more stringent test of the interrelationship of political and economic orientations would be to examine that interrelationship while controlling for demographic correlations. Because correlations do not reveal the direction of causality, we face the question whether the measure of political reformism or the measure of economic reformism should serve as the dependent variable. Others' recent analyses suggest, however, that political orientations have a stronger impact on economic outlooks than vice versa (Duch 1993; Gibson 1993). We therefore employ the locus-of-responsibility measure as the dependent variable in a multivariate regression. The results of this regression are shown in Table 6.

In both years, a strong positive association exists between support for political reform and a favorable view of individual initiative even after controlling for various demographic characteristics and the signifi-

cant economic (retrospective and prospective personal financial situation) and life satisfaction variables employed in Table 3. Moreover, adding the measure of support for political reform improves the explanatory power of both years' models beyond that obtained in Table 3.

The results of testing this model are largely the same for the 1991 and the 1992 data. One difference between the two years deserves note. Even after adding the political reform measure to the equations, the question asking whether the economic situation of the respondent's family had improved, stayed the same, or became worse over the past year had twice as powerful an impact in 1992 as in 1991, whereas the impact of the prospective measure remains unchanged. The strong positive coefficient for assessments of one's financial situation, particularly the retrospective assessments in 1992, thus confirms the results reported earlier in Table 3.

The picture that our data present seems clear. Mass orientations toward economic and political reform are not independent of each other: they do not oppose but rather reinforce one another in the former Soviet Union. Those most accepting of the former Soviet regime's political institutions and norms look least favorably on marked norms and institutions, and vice versa. This relationship holds true for both years of our surveys and even when we control for such key societal cleavages as age and level of education.

CONCLUSION

How do we explain the discrepancies between our findings and those reported by Finister and Mickiewicz? In part Finifter and Mickiewicz themselves provide the answer, as they acknowledge that "single items are generally less valid than multi-item indicators" (1992, 861). Our analysis certainly does suggest that there were some problems with their Q22a as a single-item measure of attitudes toward the economic system. Whether these were problems of translation, question clarity, or data entry errors we do not know. To a great extent the discrepancies revealed by our analysis focus on that single item. Thus the validity of the entire data set is not necessarily called into question. (For more on concerns about the validity of the earliest surveys coming out of the Soviet Union, see Miller, Reisinger, and Hesli 1993.) Of course, the rapid change occurring in the Soviet Union during the Gorbachev era could also have contributed to the differences between our results and those reported by Finifter and Mickiewicz. The longitudinal data presented here, especially in Table 4, reveal the significant shifts in attitudes toward political reform that were taking place during the last days of the Soviet Union. It is possible, therefore, that some of the discrepancies could be accounted for by attitude volatility rather than limitations in the data.

Regardless of the discrepancies between the two sets of data, we should not lose track of the fact that on a number of points the various data are in agreement. Moreover, such data, particularly the longitudinal data, provide an empirical basis for verifying hypotheses regarding life and politics in the former Soviet societies. Clearly this is a tremendous improvement over what could be done in an earlier period when the collection of such data was not permitted.

The longitudinal data, as well as the regressions presented in Table 6, demonstrate that Soviet public attitudes on economic and political reform were more interconnected and consistent than Finifter and Mickiewicz suggest (1992, 869). Individuals who preferred political reforms of a democratic nature also favored a decreased role for the state as guarantor of economic well-being. Being a political reformist,

^{*}p < .01.
**p < .001.

[&]quot;Pro-reform = high.

Better off = high.
Satisfied = high.

 $^{^{}d}$ Male = high.

therefore, does imply an abandonment of the socialist system in favor of increased individual responsibility even when it comes to the social welfare of citizens. In short, *perestroika*, which included policies that presumably promoted both political democracy and a shift toward decentralization, was a reflection of public preferences.

In addition, the longitudinal data reveal significant variation, both cross-sectionally and across time, in support for democratic and economic reform in the Soviet and post-Soviet societies. The analysis demonstrates that the explanations for this variation in public support for reform are complex and multifaceted. The self-interested pursuit of material benefits suggested by Finifter and Mickiewicz (1992, 870), is no doubt one factor accounting for the variation in support of reform. However, socialization, political ideology, and the public's response to current economic and political change may be even more important for understanding variation in support or opposition to continued reform in the post-Soviet societies. All of this, of course, leaves us with a challenging agenda for future research.

APPENDIX

The goal of the University of Iowa's Post-Soviet Citizen Surveys (PSCS) conducted in 1990, 1991, and 1992 was to interview a representative sample of adult citizens living in three Soviet republics: Lithuania, Ukraine. and the portion of Russia west of the Ural Mountains. The particular republics were selected on the basis of size of population, economic importance within the Soviet Union, and political relevance. Russia and Ukraine are the republics with the largest populations and highest gross national products among the 15 republics of the former Soviet Union. Although Lithuania accounted for less than 2% of the Soviet population, it was politically very important because, being among the Baltics, it represented the early moves toward secession from the Soviet Union. Primary funding for the surveys was provided by National Science Foundation Grants SES 90-23974 and SGER 90-09698. Soviet support for the project was provided by the Soviet Peace Fund, the Soviet Peace Committee, and the Soviet Political Science Association.

The Sample

The sample size for the study was 1,800 completed interviews in 1990, 3,000 in 1991, and 2,700 in 1992. The study design called for proper representation of the larget population in each of the three republics. The total number of interviews in 1990 was divided equally among the republics, 600 in each. In 1991, the target sample was divided as follows: 1,400 in Russia, 1,000 in Ukraine, and 600 in Lithuania. The 1992 sample was comprised of 1,300 interviews in Russia, 900 in Jkraine, and 500 in Lithuania.

The sample approach used for selecting respondents was a four-stage stratified sample. At the initial stage, each republic was divided into strata reflecting the extent of urbanization, geographic region, the distribution of nationalities, and population density. These criteria produced eight strata for Ukraine and Russia and four strata for Lithuania. The second stage of the sample involved listing the places that fell into each strata and selecting, with probabilities proportionate to size, a number of primary sampling units from each strata. The 1990 sample, because of limited funds, employed 40 primary sampling units, whereas the 1991 and 1992 studies had 81 primary sampling units. The third stage of the sample involved enumerating all the voting districts for each of the primary sampling units. Between 4 and 23 voting districts were randomly selected for each primary sampling unit depending on

the size of the place. The final stage of sampling involved selecting specific individuals from the voter lists—cross-referenced with residence records—for each of the selected voting districts. The procedure involved the calculation of a sampling interval n for each particular list, selecting a random number between 1 and n as the starting point and then selecting every nth person from that starting point. No substitution of respondents was allowed. The overall response rates in the studies were high by Western standards: 89.4%, 83.7%, and 87.4% 1990, 1991, and 1992, respectively. The response rates were virtually the same for each republic.

Ouestionnaire Construction

The survey instrument was designed through a series of meetings between the United States research team and a group of Soviet scholars: Andrei Melville, Alexander Nikitin, and Elena Bashkirova. The questionnaire was translated from English into Russian, Lithuanian, and Ukrainian and back-translated in the Soviet Union and in the United States using native-speaking Russians, Lithuanians, and Ukrainians. This translation-back-translation process was carried out a number of times until an agreement was reached on the particular translation to be employed. Prior to the final revisions, a pretest was conducted in Moscow, Kiev, and Vilnius. Neither the questionnaire nor the interviewers gave any indication that the survey was part of a collaborative project involving American researchers. The average interview took 38 minutes in 1990 and 45 minutes in 1991 and 1992. All interviews were conducted from 18 May to 21 June 1990, from 20 May to 25 June 1991, and in late June 1992. All questionnaires were later transported to the United States, where they were used to code open-ended questions and to correct any data entry errors.

Interviewing

The interviewers were recruited and initially trained by staff from the USSR Academy of Sciences, Institute of Sociology in Moscow, under the supervision of Elena Bashkirova. In addition, the American investigators provided further interviewer training sessions prior to the start of each study period. During the interviewing period, the American scholars traveled to the various sample points to supervise the data collection and to be certain that appropriate interviewing procedures were being followed.

Our experience of having conducted three waves of interviewing in the republics of the former Soviet Union has served to reinforce the need to take standard precautions aimed at assuring valid and reliable data. In addition to the usual concerns about sampling, proper translation of questions, and the appropriate training of interviewers, we feel that any researcher conducting survey research in the former Soviet Union must spend time in the field supervising the data collection, as well as verifying the quality of the interviewing and the accuracy of the recorded data. In addition, it is incumbent on the researcher to retrieve and archive the completed questionnaires so they can be used for correcting data entry errors. Finally, as a contribution to the advancement of the profession and as a means of checking the veracity of published results, all data used in scholarly work should be made available to others for secondary analysis through the ICPSR. The authors may be contacted for a more detailed description of the surveys.

Questionnaire Items Used in the Locus-of-Responsibility Index

- 1. Some people say the government of Russia [Ukraine, Lithuania] should guarantee everyone work and a high standard of living, others argue that every person should look after himself. On this card is a scale from 1 to 5, where 1 signifies that the government guarantees everyone work and 5 that every person should look after himself. Which position corresponds to your view?
- There should be a mechanism regulating income such that no one earns very much more than others. (agree/disagree)
- 3. Speaking only of Russia [Ukraine, Lithuania], what type of property would be best: private property, collective property or only state property?

4. Some people think that certain groups in society have too much influence on life and politics in Russia [Ukraine, Lithuania] and that other groups don't have as much as they deserve. Do you think "Businessmen" have too much, too little or the right amount of influence?

Notes

We wish to thank Chia-hsing Lu and Andy Peebler for assistance in the data analysis and Peggy Swails for her secretarial assistance.

1. The data from the 1990 survey is now publicly available through the ICPSR. The 1991 and 1992 survey data will be available for reanalysis by the end of 1994.

2. The Cronbach alpha reliability coefficients for a four-item scale were .68 and .63 for 1991 and 1992 respectively.

3. For statistical significance, we are restricting the probability of type I error to less than .01. The item, however, had relatively little variance, so that some evidence of a relationship between evaluations of the national economy and locus of responsibility does exist.

4. Cronbach's alpha for the proreform index in each of the three former republics for 1991 and 1992 is as follows:

Year	Russia	Ukraine	Lithuania
1991	635	.635	.448
1992	.656	.478	.407

- 5. The regression analysis for 1990 is not presented in Table 5. All demographic variables, and the single attitudinal indicator have the same directional impact as in 1991 and 1992. The major difference is the fact that the set of variables explains a larger portion of the variance in 1990 as compared with the later years. We excluded 1990 from the regression analysis because the proreform index can be expanded to a 17-point scale if we rely only on the 1991 and 1992 data. In these years, the options given to respondents on the agree/disagree battery employed five options from strongly agree to strongly disagree. In 1990, the options were limited to agree, neutral, or disagree.
- 6. Finifter and Mickiewicz actually report a slight negative correlation between locus of responsibility and political reform (1992, 861). But on the very same page they also report that the results of a factor analysis demonstrate that Q22a, the single item measuring locus of responsibility "is orthogonal to the other items."

BAYESIAN INFERENCE FOR COMPARATIVE RESEARCH

BRUCE WESTERN Princeton University SIMON JACKMAN University of Rochester

Regression analysis in comparative research suffers from two distinct problems of statistical inference. First, because the data constitute all the available observations from a population, conventional inference based on the long-run behavior of a repeatable data mechanism is not appropriate. Second, the small and collinear data sets of comparative research yield imprecise estimates of the effects of explanatory variables. We describe a Bayesian approach to statistical inference that provides a unified solution to these two problems. This approach is illustrated in a comparative analysis of unionization.

widely used tool in quantitative comparative politics is the linear regression model, estimating relationships between institutional and economic variables observed for a set of countries constituting some population of interest. A brief survey of recent comparative research finds no shortage of work of this type. For instance, Remmer (1991) identifies economic crisis as a source of electoral volatility in Latin American countries in the 1980s; Robertson (1990) presents evidence that institutions moderating the transaction costs of negotiations between capital and labor reduce industrial conflict; and Golden (1993) finds that union wage moderation in industrialized democracies results from coordinated collective bargaining.

Although the methodological advantages are well documented (Jackman 1985), we identify two distinct problems of statistical inference endemic to this type of quantitative comparative research. First, because the data constitute all the available observations from a population, conventional inference based on the long-run behavior of some repeatable data mechanism is not appropriate. Second, because data sets tend to be small and collinear, the effects of explanatory variables are estimated imprecisely. In most applications the first problem is generally ignored and the second is solved by imposing restrictions on the regression model to obtain "sensible" results.

The Bayesian model of statistical inference provides a unified solution to these two distinct problems of quantitative comparative research. Two features of Bayesian inference are important in this context. First, probability is conceived subjectively as characterizing a researcher's uncertainty about the parameters of a statistical model. This subjective probability concept seems particularly useful in comparative settings, where the data are typically convenience samples not generated by a known probability mechanism such as random sampling. Second, Bayesian inference allows the inclusion of other information, in addition to the quantitative sample information. Again, this seems useful in the comparative context where rich historical material is commonly available, sparking ideas for researchers, but formally discarded in the final analysis. In the Bayesian approach, this historical material can be formally incorporated into the analysis.

We begin by detailing why the nonstochastic and weak data typical of comparative research are problematic for conventional linear regression analysis. We next introduce some ideas about Bayesian inference and describe Bayesian regression analysis. These ideas are applied to a comparative analysis of unionization—the subject of a recent exchange in the American Political Science Review between Michael Wallerstein and John Stephens (Stephens and Wallerstein 1991; Wallerstein 1989). The Bayesian regressions we present are supplemented with a sensitivity analysis that investigates how our conclusions depend upon the sample data and our prior beliefs.

Although we survey some ideas in Bayesian statistics, a full introduction to the Bayesian approach to statistical inference is beyond our scope here. (Good book-length treatments are Pollard 1986, Lee 1989 and, at a slightly higher level, Press 1989.) Our intention here is to spotlight problematic but ignored issues of statistical inference in a common area of application. The Bayesian alternative that we present represents just one way forward to address these inferential problems.

TWO FEATURES OF COMPARATIVE DATA ARE PROBLEMATIC

A common design in comparative research generates data with two important characteristics: (1) the data constitute all the available observations from a population; and (2) the data, because of small sample size and collinearity, tend not to be very informative about the statistical parameters being estimated. Although our focus on comparative research is stimulated by the preponderance of studies with data of this type, our arguments are generalizable to other areas using data with these characteristics. For example, studies comparing the American states could well be another area of application (e.g., Barrilleaux and Miller 1988; Erikson, McIver, and Wright 1987).

Nonstochastic Data

Unlike analysts of survey research data or experimenters who randomly assign subjects to treatments, comparativists often collect all the available observations from some population of interest. For example, populations including "advanced industrial societies" (Wallerstein 1989), "contemporary democratic political systems" (Powell 1982, 2), and the "affluent market-oriented democracies" (Swank 1988, 1121) have all been studied by comparative researchers. In contrast to experimental or social survey data, comparative data are not generated by a repeatable data mechanism. Repeated applications of survey or experimental designs, on the other hand, yield new data sets with more information about the process under study. In comparative research, once all the data are collected from a population, further applications of the data collection process do not yield more information. Data of this type, generated by a nonrepeatable and unknown probability process, are described by Freedman and Lane (1983) as "nonstochastic." We adopt their terminology here.

To see why nonstochastic data create problems for conventional statistical inference, we briefly review the concept of frequentist probability. This idea is the workhorse of conventional, or frequentist, statistics. In 1837, Denis Poisson defined probability as the limiting distribution of a long-run relative frequency. If, for example, a coin is tossed n (a very large number) times and shows m heads, we can write the prob(heads) $\equiv p = m/n$, assuming that m/n coverges. In this case, the probability of heads, p, is the proportion of heads that will be observed when n grows to infinity. The probability, p, like size or weight, describes an objective characteristic of the coin (Barnett 1982, chap. 3; Leamer 1978, chap. 2).

Frequentist statistical inference assumes that data are generated by a repeatable mechanism such as the coin flip. Von Mises provides the paradigmatic statement of this view: "In order to apply the theory of probability we must have a practically unlimited sequence of uniform observations" (quoted in Barnett 1982, 76). A sample observation is thus just one possible result from many possible draws from a probability distribution. In practice, these draws are implemented by probability sampling (as in a social survey) or random assignment (in an experiment). Frequentist inference makes conclusions about a parameter (perhaps a mean or a regression coefficient) obtained from a sampling or assignment process, as if that process was repeated a large number of times. For example, a random sample survey of American adults may indicate that mean income in the United States is \$35,000. Assuming (rather implausibly) that income is normally distributed, we could estimate a 90% confidence interval for our sample mean, perhaps [\$15,000, \$55,000] for a modestly sized sample. Using conventional frequentist inference we can conclude that intervals like the one calculated would cover the true (population) mean income 90% of the time for repeated applications of the sampling procedure. The "repeated sampling" inference tells us neither whether the population mean lies within the estimated interval nor even with what probability the mean lies in the interval. Specifically, the frequentist inference does not entitle us to claim there is a 90% chance that the true mean falls within the estimated interval. The only available conclusion concerns the long-run behavior of a statistic—in this case, the 90% confidence interval.

While frequentist inferences from survey data allow conclusions about probability sampling processes, nonstochastic data create problems for frequentist inference because they are not generated by a repeatable mechanism. Frequentist inference is simply unrealistic given the manner of data collection. Comparative researchers sometimes show an uneasy awareness of this problem. In their analysis of advanced industrial democracies, Lange and Garrett frankly report that they "adhere to traditional standards [i.e., significance tests] while remaining unsure of their applicability" (1987, 268). In a similar vein, Weede endorses the use of t-statistics for testing hypotheses in his study of welfare state size in industrial democracies, not only for methodological reasons but also because "it is almost universal practice in econometrics and the social sciences" (1986, 518). More confusion is revealed in Gorin's comparative study of inequality that "cannot utilize probability theory to ascertain the level of significance" for want of "random samples"; he goes on to note that asterisks indicate a ".05 level of significance" (1980,

Comparative researchers' discomfort with frequentist inference is well founded because frequentist inference is inapplicable to the nonstochastic setting. It is simply not relevant for the problem at hand to think of observations as draws from a random process when further realizations are impossible in practice and lack meaning even as abstract propositions. In short, frequentist inference answers a question that comparative researchers are not typically asking (see also Freedman and Lane 1983, 189).

Two objections might be raised at this point. One challenge might be that statistical inference is unnecessary in the nonstochastic setting because all the available information is collected. This position is certainly valid, but it still commits the researcher to a substantive theory of how the data were generated. In particular, if there is no uncertainty associated with the data and if statistical inference is expendable, the researcher is effectively claiming that things could not have been different, that the data were generated by a completely deterministic process. This suggests a thought experiment: If we could set in motion, once again, the historical conditions that gave rise to the data, would the ensuing process generate a data set identical to the one actually obtained? Commitment to this type of determinism is the cost of abandoning statistical inference (Berk, Western, and Weiss 1993).

The second objection holds that although the data mechanism is not repeatable, it can be treated as if it were. In this view, the social world randomly draws observations from a set of all possible observations, or a "superpopulation" (Cochran 1953, 169). The data are one realization of all possible data sets that might have been collected. Or as one reviewer put it, "each country's history is one draw of a distribution of possible histories." While this assumption avoids a deterministic theory of the data process, it is highly speculative compared to positive knowledge about a sampling procedure or, in Fisher's uncompromising phrase, "the physical act of randomization" (quoted in Freedman and Lane 1983, 197). Even more troubling, however, is the conclusion that conventional inference allows in this instance. Take the example of a confidence interval for a mean where we can conclude that under repeated realizations (which are acknowledged to be impossible), the interval would cover the true mean 90% of the time. We have no way of knowing whether the current interval is one of the fortunate 90% and no possibility of further replications. (Our focus here has been on the confidence interval because this is the inferential tool on which we shall rely in our application and the one that implicitly underlies classical hypothesis tests. Similar criticisms of classical hypothesis testing and other aspects of frequentists inference are reviewed in Barnett 1982, 180-88).

Weak Data

The problem of statistical inference in comparative research is exacerbated by the weakness of comparative data. These data are weak in the sense that they provide little information about parameters of statistical models. The uninformative character of the data is reflected in large standard errors and consequently large *p*-values.

Weak comparative data have two distinct causes. First, the sample sizes characteristic of comparative research are small in relation to the number of parameters being estimated. While comparativists frequently make do with less than a hundred data points, survey researchers frequently have more than a thousand. For example, comparative researchers have defined the population of advanced capitalist democracies to include between 15 and 21 countries (Lange and Garrett 1985; Wallerstein 1989). Sometimes, even where samples sizes are fairly large, a relatively large number of parameters must be estimated (e.g., Williams 1991). Ideally, if more data could be collected this would be one solution to the uninformative data problem. As the sample size increases in relation to the number of parameters, the estimated variances of the regression coefficients would tend to decline.

Collinearity is the second cause of weak comparative data. In a comparative setting, collinearity is common because the explanatory variables are themselves often causally related. When explanatory variables are collinear, they carry little independent information about the various regression coefficients. A

regression on collinear predictors can yield estimates with unexpected signs and large standard errors.

To foreshadow some Bayesian ideas, collinearity provides no statistical difficulties except in very extreme instances (of exact or near-exact linear dependencies) which are seldom encountered in practice. The least squares estimators retain their properties, and statistical inference can proceed as normal. Why, then, is collinearity regarded as problematic? The difficulties caused by collinearity—large standard errors and unexpected signs for regression coefficients—are only problems with respect to prior expectations about the signs and variances of the coefficients (Leamer 1978, 170). As Leamer argues, collinearity is thus not a statistical problem but a problem of the interpretation of multidimensional evidence (pp. 170–73). As a tool of interpretation, the least squares estimator in the presence of collinearity does not allow us to distinguish information about one coefficient from information about another. Instead, the least squares estimator is informative about linear combinations of coefficients. The introduction of nonsample information allows sample information to be allocated among the coefficients according to substantive criteria.

A more familiar approach to collinearity involves constraining coefficients to zero (excluding them from the analysis). This is an informal way of introducing information to obtain sharper estimates of other coefficients. The researcher is implicitly saying, "To obtain a sensible estimate for the effect of x_1 , I must estimate the model on the basis of the substantive claim that x_2 had no effect at all." The substantive claim that x_2 has no effect allows the weight of the sample evidence to be allocated in favor of x_1 . Here, of course, a "sensible" estimate of the regression coefficient for x_1 is based on (typically unstated) prior expectations. Dropping x_2 introduces known specification errors, and in part defeats the motivation for statistical control that led to multivariate techniques in the first place. (The papers in Granger 1990 on model specification provide an elaborate treatment of this issue from Bayesian and non-Bayesian perspectives in econometrics.)

In sum, the weak evidence of comparative research that results from small data sets and collinearity yields weak or fragile inferences that are highly sensitive to the model specification. This is the natural outcome of an analysis based on little evidence. The only solution to this problem is the introduction of more information. But as a practical matter, more information is frequently not available. Data have been collected from all the countries in the sample. The growing popularity of pooled cross-sectional times series designs suggest one remedy to the weak data problem (e.g., Alvarez, Lange, and Garrett 1991; Beck et al. 1993; Radcliff 1992; Swank 1992); but additional time points often provide little new information because the processes being studied show far more cross-national than longitudinal variation (e.g., Wallerstein 1989, 482). Institutions, for example, do not change much over time but show considerable

cross-national variation. Furthermore, the collinearity problem is distinct from small sample size and can afflict the pooled cross-sectional design irrespective of the number of observations. However, while extra quantitative information is typically unavailable, large and substantively rich stores of qualitative information from comparative and historical studies are often present but not available in a form suitable for analysis. Bayesian procedures enable the weak quantitative information of comparative research to be pooled with the qualitative information to obtain sharper estimates of regression coefficients. Although we shall focus on situations in which the data are weak, Bayesian methods can also be applied (generally with less consequence) where the data are highly informative.

BAYESIAN INFERENCE

The Bayesian approach to statistical inference involves pooling nonsample (or "prior") information with sample data to formulate posterior subjective probability statements about the parameters of a statistical model. This description of Bayesian inference signals two aspects of the Bayesian approach that distinguish it from conventional inference. First, Bayesian inference is built upon a subjective probability concept. Second, Bayesian inference allows the introduction of prior information in addition to the sample information to make statistical inferences.

Subjective Probability

In contrast to the frequentist concept that refers to objective probability features of the world, subjective probability refers to a person's *degree of belief* in an uncertain event. Subjective probability is thus a personal statement of certainty or confidence, rather than a fact characterizing an object in the external world. Subjective probabilities share the same axioms as objective probabilities and are consistent with formal rules for rational decision making (Barnett 1982, chap. 3). The difference between subjective and objective probability resides in whether the probability statement refers to an individual's personal feeling of confidence, or whether it characterizes an objective feature of the world.

Prior Information in Regression

In Bayesian inference, researchers' subjective probability assessments of the parameters of a statistical model are pooled with the sample data to arrive at posterior probability statements about those parameters. The prior information is represented in a probability distribution. In the normal regression case that we are concerned with, this prior probability distribution can be summarized by prior means and variances for the regression coefficients. (Tanner 1993 considers more complicated applications.) The posterior probability statements express the researchers'

degree of belief in the parameters, given the data and the prior, replacing conventional inference about the distribution of coefficient estimates in repeated sampling. We can begin to see how prior information is incorporated into a data analysis by first reviewing how two data sets might be pooled in a regression analysis.

Two data sets, (X_1, y_1) and (X_2, y_2) , can be pooled for a regression analysis as follows:

$$\begin{bmatrix} y_1 \\ y_2 \end{bmatrix} = \begin{bmatrix} X_1 \\ X_2 \end{bmatrix} \beta + \begin{bmatrix} u_1 \\ u_2 \end{bmatrix}.$$

Following Leamer, if we write σ_1^2 and σ_2^2 for the two residual variances, the least squares estimate of β from the pooled data is

$$b_{pooled} = (\sigma_1^{-2} X_1' X_1 + \sigma_2^{-2} X_2' X_2)^{-1} (\sigma_1^{-2} X_1' X_1 b_1 + \sigma_2^{-2} X_2' X_2 b_2), \quad (1)$$

where $b_1 = (X_1'X_1)^{-1}X_1'y_1$, and $b_2 = (X_2'X_2)^{-1}X_2'y_2$ (1978, 76).

Although equation 1 may look a bit cumbersome, the pooled estimate for β is just a (matrix) weighted average of the two sets of least squares estimates obtained from each of the data sets.

Equation 1 is useful from the Bayesian point of view, because it suggests how sample and prior information can be combined to obtain posterior distributions for regression coefficients. The regression coefficients estimated from the first data set, b_1 , can be replaced by a set of regression coefficients that the researcher believes a priori are most probable. These are the prior means, written b^* , of the prior probability distributions we have referred to. Note that the inverse of the first part of the first term in equation 1 is the estimated variance of the coefficients from the first data set. This variance can be substituted by the subjective Bayesian prior variance, V^* , for the coefficients. Uncertainty about the prior means is reflected in the specification of V^* . Larger variances for a prior mean imply greater uncertainty. Prior covariances—off-diagonal terms in the prior covariance matrix-can also be specified if beliefs about one coefficient depend on beliefs about others -say, if one is estimating main and interactive effects in a regression equation and if confidence in the interaction effects depends on confidence in the main effects (e.g., Lange and Garrett 1985). The prior covariances, expressing dependent beliefs about the regression parameters, thus do not directly relate to prior beliefs about relationships in the sample data. Because beliefs about the coefficients are generally independent, the prior covariance matrix for the regression coefficients is often specified to be diagonal.

Substituting the prior information into equation 1 provides an expression for the posterior mean based on a combination of the prior and sample information:

$$b = (V^{*-1} + \sigma^{-2}X'X)^{-1}(V^{*-1}b^* + \sigma^{-2}X'y)$$
 (2)

where X and y designate the sample information (the subscripts are now redundant) and the residual variance, σ^2 , is estimated from the sample data. (Note that when the expression for the sample parameter estimate is expanded in equation 1, the cross-product matrices in the second term cancel out, leaving X'y.) The variance of *b* is given by the first term of equation 2 and standard deviations for the posterior coefficients are the square roots of the diagonal elements of this matrix. An alternative route to these expressions for the posterior means and variances of the regression coefficients is to multiply a normal prior distribution by a normal likelihood for the sample data, treating the residual variance as known. This is an application of Bayes Theorem, and it yields a multivariate normal posterior distribution for the coefficients. The posterior means and variances of this multivariate distribution are identical to the expression we obtained in equation 2. The pooling exposition highlights, however, how subjective prior information can supplement the weak sample data common in comparative research.

Approaching the Bayesian regression problem in this way, the posterior is simply a pooled estimate based on the sample data and the "data" represented by the researcher's prior beliefs. Bringing prior information to bear on an inferential problem via Bayes Theorem involves the same procedure as if one were to collect more data: in both cases, the researcher pools the sample information with the prior distribution or additional data using equation 1 or equation 2.

The resolution of collinearity problems through the introduction of prior information is made clear by the expression for the posterior variance—the first term of equation 2. If prior means are set to zero, a diagonal prior covariance matrix will improve the conditioning of the explanatory variables, resulting in regression coefficients with smaller variances. This estimator is a special case of the generalized ridge estimator (Belsley 1991, 300), except that in the Bayesian case the ridge for the sample cross-products matrix is chosen according to substantive criteria rather than arbitrarily. Bayesian regression thus solves the problem of collinearity by using more information than ordinary least squares, generating smaller standard errors for the regression coefficients.

A convincing Bayesian analysis goes further than just calculating the posterior distributions. Because the two ingredients for Bayesian regression—the prior and the sample information—influence the final results, a thorough analysis should explore the sensitivity of these results to the prior and the data. Robust findings yield substantive conclusions that are insensitive to small changes in the sample and nonsample information. These ideas will be detailed below.

In sum, Bayesian regression analysis provides answers to the problems of comparative research that we have identified. First, subjective probability replaces the conventional concept, providing a more realistic basis for analyzing data collected without a repeatable data mechanism. Second, more informa-

tion is brought to the analysis through the prior distribution. Weak data resulting from small samples and collinearity (common in comparative research) are bolstered by the prior, increasing the precision of the estimated regression coefficients. Finally, the robustness of Bayesian results can be explored through an analysis of the sensitivity of the posterior to the sample data and the prior information.

BAYESIAN REGRESSION ANALYSIS IN A MODEL OF UNION DENSITY

We illustrate Bayesian regression analysis in the context of a recent exchange between Wallerstein and John Stephens. Wallerstein and Stephens are concerned to explain cross-national variation in union density—the percentage of a work force that are union members. Wallerstein argues that the size of the civilian labor force is a key determinant of union density. Stephens claims that density depends on industrial concentration. These two predictors correlate at -.92 and Stephens writes that "because of multicollinearity, economic concentration and the size of the labor force could not be entered in the same equation" (Stephens and Wallerstein 1991, 945– 46). Of course, as noted, no statistical argument prevents the inclusion of both predictors in a regression on union density. Stephens is simply observing that because of the correlation between labor force size and industrial concentration, the data will not be very informative about coefficients for either variable, and the results may be sharply at odds with prior expectations. The problem of collinearity results partly from incomplete data for economic concentration. Stephens uses information about logged gross domestic product to impute missing observations for 9 of the 20 countries in the sample, yet gross domestic product also correlates highly with labor-force size. For this analysis, we bracket the issue of missing data, although it should be noted, with Wallerstein, that Stephens's imputation strategy provides only weak information about economic concentration (pp. 949-50).

Two other features of the Stephens-Wallerstein data are also noteworthy. First, the sample is not generated by any known probability mechanism such as random sampling. The 20 countries comprising the sample were chosen because they experienced a continuous history of political democracy since World War II (Wallerstein 1989, 489). In the absence of some rather fanciful assumptions about probability features of the data-generating mechanism, the classical model of statistical inference is inappropriate. Second, the weak data problem that results from collinearity is compounded by the small sample that provides little statistical power. Stephens implicitly recognizes this problem in the analysis by using a relatively large level of statistical significance (.1). Here, then, is a classic example of weak data generated by an unknown probability mechanism in a

TABLE 1

Prior Means (Standard Deviations) and Their Substantive Interpretations for Bayesian Regression Analysis of Union Density

VARIABLE	PRIOR	SUBSTANTIVE INTERPRETATION
Wallerstein's priors		
Left government	.3 (.15)	One year of left-wing government increases union density by about 1 percentage point. A year of left-wing government may increase union density by as much as 2 percentage points of union density, but its effect is almost certainly not negative.
Logged labor-force size	-5 (2.5)	Doubling the size of the labor force would reduce union density about $\ln(2) \times 5 \approx 3.5$ percentage points. This increase in labor-force size may generate a union decline as big as 7 percentage points, but a growing labor force is unlikely to increase union density.
Economic concentration	0 (10 ⁶)	The diffuse prior indicates that the researcher has no strong prior beliefs about the sign or magnitude of an effect. When the explanatory variables are uncorrelated, the diffuse prior yields posteriors that are approximately given by the sample data.
Stephens's priors	, ••	
Left government	.3 (.15)	Like Wallerstein's prior, one year of left-wing government increases union density by 1 percentage point.
Logged labor-force size	0 (10 ⁶)	Diffuse prior.
Economic concentration	10 (5)	If economic concentration were to increase by 100% in relation to the United States, union density would increase by 10 percentage points. This increase in the concentration ratio may generate a density increase as large as 20 percentage points, but any increase in concentration is unlikely to decrease union density.

Note: Left government is measured by Wilensky's (1981) cumulative index of left-wing government; logged labor-force size is the natural log of the size (in thousands) of the dependent labor force in the year that union density is measured; and economic concentration is measured by the four-firm concentration ratio, in proportion to the United States.

comparative setting. Our data are taken from, and described by, Stephens (Stephens and Wallerstein 1991). Note that labor-force size is measured on the log scale, so that the coefficients express the changes in union density in response to percentage changes in labor-force size. Economic concentration is measured as a ratio to U.S. economic concentration, so that the coefficients express the change in union density as a result of a country's change in economic concentration in relation to the United States.

What light can Bayesian regression analysis shed on the Stephens-Wallerstein debate? From the Bayesian perspective, the source of the controversy between Stephens and Wallerstein is the data that are not strong enough to allow a convincing resolution one way or another. Both researchers informally enlist more information to support their arguments. In Wallerstein's case, this information is a formal theory about the relationship between labor-force size and union density. For Stephens, supplementary information comes from historical material and, in particular, the research of Kjellberg (1983). The Bayesian approach allows the information informally introduced into the analysis by Stephens and Wallerstein to enter formally through a prior distribution.

To begin this analysis, we specify two sets of prior information that represent the opinions of the two researchers. Unfortunately, neither theory is suffi-

ciently precise to unambiguously suggest a prior distribution. (We shall return to this issue.) However, it is clear that both Stephens and Wallerstein are confident that left governments assist union growth. We quantify this confidence with a prior mean of .3 and a prior standard deviation of .15 (Table 1). Because the prior 95% confidence interval— $.3 \pm (1.96)$ × .15)—does not overlap zero, both researchers are quite confident that left government is unlikely to have a negative effect on unionization. As Wallerstein notes, this effect probably suffers from simultaneity bias because unions increase the electoral success of left-wing parties (1989, 490). Because our substantive focus is on the effects of labor-force size and economic concentration, we treat the left-government variable chiefly as a control and simply note that the coefficient will tend to overestimate the impact of left parties on union density. (The problem of simultaneity can be addressed through the prior distribution, but we reserve this issue for another paper; see, e.g., Leamer 1991.)

Prior opinions of the two researchers differ on the labor-force size and economic concentration effects. Wallerstein has a strong belief in a negative labor-force size effect, although his theory does not suggest how large this effect might be. A few quasi-experimental comparisons using information from outside the sample suggests a plausible prior mean. In 1950,

Sweden and Norway shared similar union structures, ethnic homogeneity, and histories of social democracy. The Swedish labor force was about twice as large as the Norwegian, and the unionization gap was about 20 percentage points. If a fifth of the unionization gap (4 percentage points) were attributable to labor-force size, the size effect size would be $4/\ln(2) \approx 5.5$. We get a similar number if we think that about a fifth of postwar American union decline is due to the near-doubling of the U.S. labor force. Choosing a size effect to explain a fifth of the variability in union density reflects, rather arbitrarily, our belief in the quality of the model specification. Fourfifths of the variability in union density is left to the effects of other causes. Confidence in the sign of the effect is reflected in a prior standard deviation that yields a 95% confidence interval that excludes zero.

Stephens believes that economic concentration increases union density, although a prior mean is not obvious from his discussion. Again, we develop a prior based on a quasi-experimental comparison using nonsample information—this time, examining declining economic concentration and union density in the United Kingdom through the 1980s. Measuring economic concentration as the average size of British manufacturing establishments as a ratio of the size of American firms at a fixed point in time, economic concentration in Britain declined by about .3 from the late 1970s to the late 1980s. (See the United Nations Yearbook for Industrial Statistics for 1982 and 1991.) Union density in this period declined by about 15 percentage points. If economic concentration generated about a fifth, or 3 percentage points, of the decline, a plausible prior mean would be (3/.3) = 10percentage points. Confidence in this effect is again supplied through by a prior distribution whose 95% confidence interval does not overlap zero. Note that the style of reasoning behind the specification of these priors is only illustrative. More plausible or more confident specification of prior information would require a much more detailed substantive or theoretical discussion (e.g., Western 1994).

We must also specify a prior for the intercept term, Wallerstein's prior for Stephens's economic concentration variable, and Stephens's prior for Wallerstein's labor-force-size variable. Here, we introduce the idea of prior ignorance that characterizes highly uncertain beliefs about parameters. Prior ignorance about the coefficients can be defined by a zero prior mean and a very large prior variance (Leamer 1978, 62). When ignorance is defined in this way for all the coefficients of the model with a so-called diffuse prior, the posterior distribution converges on the conventional least squares result. Thus, the sample data alone will drive the analysis. If the predictors are uncorrelated and ignorance priors are placed on only a subset of the coefficients, the posteriors for those coefficients will also approach the conventional least squares estimates. In short, this ignorance prior does not so much express the belief that a regression coefficient is zero with great uncertainty: rather, the diffuse prior allows the sample information to domi-

TABLE 2

Posterior Distributions with Noninformative Prior Information in a Regression Analysis of Union Density

INDEPENDENT VARIABLES	MEAN (S.D.)	5TH PERCEN- TILE	95TH PERCEN- TILE
Intercept	97.59 (57.48)	3.04	192.14
Left government	.27 (.08)	.15	.39
Size	-6.46 (3. 79)	-12.70	22
Concentration	.35 (19.25)	-31.32	32.02

Note: These results are equivalent to the ordinary least squares estimates (N=20)

nate the prior information in the calculation of the posterior distribution. We place diffuse (or "ignorance") priors on the intercept term, the economic concentration coefficient for Wallerstein's prior, and the labor-force-size coefficient for Stephens' prior.

Results from conventional least squares estimation are in Table 2. Importantly, diagnostics show that the residuals from this least squares fit are approximately normal and the effects, approximately linear (see Fox 1990, 80–87; Hastie and Tibshirani 1990, chaps. 6–7). Thus the data conform to the structure assumed in the normal likelihood function. From a Bayesian perspective these results can be interpreted as the posterior distribution for a noninformative prior distribution. In addition to the mean and standard deviation of the posterior coefficients, we also report normal approximations for the fifth and ninety-fifth percentiles from the posterior distribution (\pm 1.64 \times standard deviation for the coefficient). These percentiles are simply an alternative way of describing the dispersion and location of the posterior distribution. The results suggest a large range of plausible and negative for values for the size effect. The effect of economic concentration is less certain. The posterior mean is close to zero and the posterior distribution stretches over a large range of positive and negative values. In short, the weight of the data favor the effect of size on union density, but neither parameter is estimated with great precision.

The introduction of prior information can sharpen these estimates. Results for Wallerstein's prior are shown in the top panel of Table 3. With the informative prior, the effect of labor-force size is now estimated with greater precision. Given the prior and the data, we can be 90% certain that the coefficient for labor-force size falls between -9 and -2. The improved conditioning of the data is also reflected in the posterior distribution for the economic concentration coefficient. Although Wallerstein's prior for the concentration effect was diffuse, the posterior mean has

TABLE 3

Posterior Distributions with Stephens's and Wallerstein's Informative Priors in a Regression Analysis of Union Density (N = 20)

INDEPENDENT VARIABLES	MEAN (S.D.)	5TH PERCEN- TILE	95TH PERCEN- TILE
Wallerstein's prior Intercept	82.43 (32.83)	28.42	136.43

Logged labor-force size	-5.44 (2.09)	-8.87	-2.00
Economic concentration	4.87 (12.41)	-15.54	25.28
Stephens's prior Intercept	70.82 (19.87)	38.13	103.51
Left government	.27 (.07)	.16	.38
Logged labor-force size	-4.79 (1.77)	-7.70	-1.88
Economic concentration	9.38 (4.84)	1.42	17.34

become larger and the standard deviation of the posterior has become about one-third smaller. The confidence region, however, still covers zero.

From Stephens's perspective, when prior information is allocated to the economic concentration coefficient, the posterior mean becomes large and positive and the standard deviation of the posterior distribution shrinks by about four-fifths compared to the least squares estimate. The posterior distribution is now completely in the positive range. Again, as prior information is introduced, inference about both coefficients is generally improved. Although the posterior mean for the size effect has shrunk under Stephens's prior, the confidence region is roughly the same as that obtained with Wallerstein's prior. Both sets of prior beliefs support the inference that laborforce size decreases union density. However, only Stephens's prior supports the conclusion that growing economic concentration increases union density.

Sensitivity Analysis

It might be objected here that the introduction of subjective prior information allows the researchers' prejudices into the analysis, corrupting the results that would be obtained from the sample data alone. This criticism has a long history, demonstrated by Fisher's charge that an experiment interpreted with prior information "would carry with it the serious disadvantage that it would no longer be self-contained, but would depend for its interpretation from experience previously gathered. It could no longer be

expected to carry conviction to others lacking this supplementary experience" (1935, 69). A contemporary champion of Fisher's position, Bradley Efron has similarly argued that Bayesian methods "fail to reassure oneself and others that the data have been interpreted fairly" (1986, 4; emphasis original). These comments of Fisher and Efron rests on the idea that a "fair data analysis"—a data analysis without prior information—is possible. In practice, however, prior information enters most analyses through coding decisions, transformations, and unreported searches over sets of explanatory variables to obtain results that look sensible in the sense of falling within an expected range of meaningful results. While all data analysts use prior beliefs, Bayesians go some way to making these priors explicit and integrating them systematically into the analysis. In the Bayesian approach then, acknowledged subjectivity is the route to objectivity (deFinetti 1974, 1:5-6).

Still, those objecting to Bayesian inference make a powerful point. Selecting a prior is subjective in the sense that two researchers will not necessarily agree on its specification. For example, at least part of Stephens's prior belief in the effect of economic concentration is based on his historical discussion of the growth of Swedish corporatist bargaining (Stephens and Wallerstein 1991, 944). Other researchers might believe the Swedish experience is unique in the sense of being uninformative about the more general relationship between economic concentration and unionization in comparative perspective. They might argue that Stephens's prior gives undue weight to the lessons of the Swedish case. What is more, priors are specified with a degree of whimsy in applied settings (Leamer 1983). For instance, although Wallerstein's argument led us to a prior labor-force-size effect of mean 5 and standard deviation 2.5, we could readily agree to an alternative prior, say one with the same mean but standard deviation 2.7. In short, neither several researchers nor even the same researcher, in practice, will prefer one prior probability distribution to the exclusion of all others.

Because the choice of prior is subjective in this sense of attracting little consensus, it is important to investigate how the posteriors depend on the priors. If the posteriors are highly sensitive to the priors, this suggests that the sample data add little to the prior information-indeed that inferences are driven by the priors alone. A parallel argument can be made about the relationship between the sample data and the posteriors. If a small number of observations from the sample data are highly influential for the posteriors, the results are similarly unstable, reflecting information about a few cases rather than the whole of the data set in combination with the priors. In sum, because of the joint influence of the prior information and the data on the analysis, a convincing analysis investigates the sensitivity of the posterior to the priors and the data.

The sensitivity of the posterior to the prior could be examined in several ways. One sensitivity analysis,

TABLE 4

Posterior Distributions for Stephens's and Wallerstein's Diffuse Priors in a Regression Analysis of Union Density

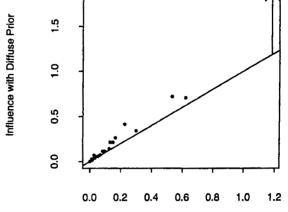

INDEPENDENT VARIABLES	MEAN (S.D.)	5TH PERCEN- TILE	95TH PERCEN- TILE
Wallerstein's prior Intercept	93.50 (52.02)	7.94	179.07
Left government	.27 (.07)	.15	.39
Logged labor-force size	-6.18 (3.42)	-11.81	56
Economic concentration	1.60 (17.68)	-27.49	30.68
Stephens's prior Intercept	80.88 (38.14)	18.15	143.62
Left government	.27 (.07)	.15	.39
Logged labor-force size	-5.42 (2.69)	-9.85	99
Economic concentration	6.11 (12.22)	-13.99	26.20

sometimes called "extreme bounds analysis," investigates variability in the posterior as prior variances are allowed to range from zero to infinity while the prior means are fixed at zero (Leamer 1983). In our application, with nonzero prior means, we simply describe the sensitivity of the posterior to a reduction in the prior information through an increase in the prior variances. An alternative approach might manipulate the prior means, although this should be pursued in the spirit of a sensitivity analysis, leaving a priori uncertainty about the regression coefficients to be expressed in their prior variances.

Note: The diffuse priors are the informative priors multiplied by 10 (N =

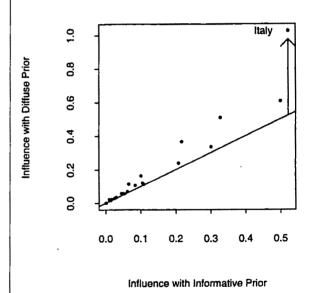

We report two more sets of posterior distributions for a diffuse prior with the prior variances multiplied by 10. Under the diffuse version of Wallerstein's prior, Table 4 shows that the labor-force-size coefficient becomes larger but substantially more imprecise. The 90% confidence region still excludes—but now borders on—zero. The posterior for economic concentration is now effectively centered over zero. For Stephens's diffuse prior, the posterior mean of the concentration coefficient shrinks by about a third, and the standard deviation of the coefficient increases by about three times compared to Stephens's informative prior. The 90% confidence interval now includes a large range of negative values expressing great uncertainty about the effect of economic concentration on union density. Finally, similar to Wallerstein's diffuse prior, the posterior for size gets slightly larger but substantially more imprecise com-

Sensitivity of Bayesian Regression Results to Prior Information and the Sample Data. (a) Wallerstein's prior

Influence with Informative Prior

(b) Stephens' prior

Note: The plot shows Bayesian influence statistics for informative priors (horizontal axis) and diffuse priors (vertical axis). If the sample data from a country have the same influence on the final results, regardless of prior, it will fall on the solid 45-degree line. Italy is an outlier, becoming highly influential as prior information is removed from the analysis.

pared to the posteriors based on the informative priors. To summarize, inferences under both priors become considerably more uncertain as nonsample information is removed from the analysis. A strong inference about the sign of the economic concentration effect depends crucially on the informative version of Stephens's prior.

The sensitivity of the posteriors to the data can be

TADEL 3

Note: In this analysis, the outlying case of Italy is omitted. The diffuse priors are the informative priors multiplied by 10 (N = 19). Least squares estimation with Italy excluded yields the following result (standard errors in parentheses): Union Density = 22.08 (63.11) + .30 (.07) × Left Government – 2.12 (4.00) × Size + 26.66 (21.41) × Concentration.

investigated with Bayesian regression diagnostics. Pettit and Smith (1986) discuss a statistic that indicates the influence of each sample observation (or set of observations) on the joint distribution of the posterior (see Appendix). This diagnostic indicates that Italy is highly influential under both informative priors. Both dimensions of the sensitivity analysis sensitivity to the prior and sensitivity to the data—are shown in Figure 1. Here, influence statistics from the informative prior are plotted against influence statistics from the diffuse prior. If the sample data from a country have the same influence on the final results, regardless of the level of prior information, the country will fall on the solid 45-degree line. However, as the prior information is reduced, the sample data generally have an increasing impact on the posterior, so that the quantitative information from most countries becomes more influential as the prior information recedes. Italy grows disproportionately in its influence on the posterior. When prior information is eliminated, this country is shifted upward on the plot and indeed drives a large part of the story.

Table 5 summarizes the posterior distribution of the coefficients when Italy is omitted. These results show that Italy is influential for the posterior means of the size and concentration coefficients but has little impact on the posterior variances. Thus our posterior uncertainty changes little as a result of deleting Italy, but the range of values over which we are uncertain changes considerably. The new posterior distributions for the reduced data set indicate that Italy was driving up the posterior mean for the size effect but suppressing the posterior mean for concentration. Under Wallerstein's prior, the bulk of the posterior for the size coefficient remains negative, although the magnitude of the posterior mean declines by about a fifth. By contrast, the posterior mean for economic concentration increases by four times when Italy is omitted. Still, uncertainty about the effect remains substantial and the 90% confidence interval still includes zero.

Interestingly, Stephens's prior produces stronger evidence for the effect of size than Wallerstein's prior when Italy is omitted. This can be explained by noting that when there is strong dependency between two variables (size and concentration in this case), prior information for one can result in a sharper estimate for the effects of the other. In effect, an informative prior for the concentration coefficient frees up independent information for the size coefficient. (For a discussion and further examples, see Belsley 1991, 311, 318). This finding illustrates an implication of our discussion of collinearity: when variables are correlated, inference about one coefficient depends on prior information about others (Leamer 1978, 176). Like the size effect under Stephens's prior, the concentration effect remains fairly robust to the exclusion of Italy. Sensitivity analysis on the reduced data set also resembles the full sample analysis, indicating the crucial importance

of prior information for inference about the signs of the size and concentration effects. With diffuse priors in the reduced sample, all posterior size and concentration effects overlap zero.

CONCLUSION

We have tried to do two things. First, we have tried to identify two problems with conventional statistical inference in comparative research: weak and nonstochastic data. Second, we have outlined a Bayesian approach to statistical inference that offers unified and principled solutions to these disparate problems. Regardless of the merits of the Bayesian approach to statistical inference, the problems with conventional frequentist inference in comparative research that we identify will not go away. Conventional inference, like Bayesian inference, is based on a positive theory of how data are generated. This is not commonly recognized. In practice, data analysis also involves the use of extensive prior information. Again, this is not widely acknowledged. A chief concern of ours, then, is to problematize conventional statistical practice in an area for which conventional statistical inference was not particularly designed.

The Bayesian alternative that we propose is one way of addressing the problems of statistical inference in comparative research. It is based on a subjective probability concept that does not rely on data generated by a repeatable mechanism. The theory of data generation behind Bayesian inference is thus more general than the theory of data generation in conventional inference. Sources of uncertainty in the Bayesian approach are not restricted to-but could include-repetitious social processes. The other advantage of the Bayesian approach in the context of comparative research is the formal incorporation of prior information. When sample data are weak, prior information provides a useful supplement to the analysis. Still, the subjective choice of prior is an important weakness of Bayesian practice. The consequences of this weakness can be limited by surveying the sensitivity of conclusions to a broad range of prior beliefs and to subsets of the sample.

To summarize the data analysis, inferences about the negative effect of labor-force size and the positive effect of economic concentration on unionization are sensitive to the priors and the data. Analysis of the full sample showed that evidence for the size effect is consistent with a large set of informative and diffuse priors. Stephens's argument for a positive concentration coefficient, on the other hand, depends decisively on a prior belief in this effect. Italy drives confidence in the size effect and contributes uncertainty to the impact of economic concentration. When Italy is excluded from the analysis, all the results are weakened substantially, and no sign inference about either the concentration or size effect is sustained under the diffuse priors.

On balance, the sample data alone are not sufficiently informative to decide whether Wallerstein or

Stephens is right. A resolution requires more information, which can be supplied through a prior distribution. The plausibility of the results is thus closely linked to the plausibility of the priors. Although this conclusion may appear unsatisfying, we would argue that it demands a lot from 20 data points to resolve a question of broad comparative scope concerning a complex process of institution building. More optimistically, if we allow information like Stephens's qualitative historical account of the impact of economic concentration on early Swedish unionization, a stronger set of results can be obtained. Thus, the data analysis underlines the importance of case studies and comparative histories to assist in the interpretation of quantitative evidence. While this is not news for comparative researchers, the Bayesian approach that we describe permits the transparent incorporation of this supplementary and influential information.

APPENDIX: BAYESIAN REGRESSION DIAGNOSTICS

Following the notation in the text, where s^2 is the sample estimate of the residual variance, Pettit and Smith's (1986) Bayesian influence statistic, I_i , expressing the influence of the ith observation on the joint posterior distribution of the regression coefficients, is

$$I_i = \frac{u_i}{2(1-u_i)} \left[u_i + \frac{e_i^2(2-u_i)}{s^2(1-u_i)} \right],$$

where $u = \text{diag}[s^{-2}(XV^*X')]$, and e is a vector of posterior residuals (the difference between the observed response and the fitted values from the observed data and posterior regression coefficients).

The *I*-statistic has parallels with conventional diagnostics. The matrix from which *u* is extracted can be understood as a "posterior hat-matrix" with the leverages of the sample observations on the posterior parameters along the main diagonal (Pettit 1985, 189; for discussion of leverage and the hat-matrix, see Cook and Weisberg 1982, 11–22). The scaled squared residuals in the expression for *I* can be thought of as squared "posterior studentized residuals" (Pettit and Smith 1986, 485).

S-Plus and GAUSS routines to calculate posterior regression parameters, confidence intervals, and Pettit and Smith's influence statistic are available on request. Press 1989 contains a useful software review.

Note

We thank David Gow for his comments on an earlier draft, and Richard Berk and Larry Bartels for their (seemingly unrelated) influences on our thinking about statistical inference. Chris Achen, Neal Beck, David Epstein, Don Green, Gary King, Sharyn O'Hallorhan, Marco Steenbergen and seminar participants at the University of California, Los Angeles, Department of Sociology provided helpful comments and criticisms. Earlier versions of this paper were presented at the annual

meetings of the Midwest Political Science Association, Chicago, 1993 and the Tenth Annual Political Methodology Conference, Tallahassee, 1993.

CONTROVERSY

PUBLIC SPHERE, POSTMODERNISM AND POLEMIC

heories of the public sphere, as standardly formulated, aim to specify the minimal, necessary conditions for a discursive realm free of coercion or manipulation. In his article in this Review in September 1992, Dana Villa urged us to reconsider this standard account. He argued that when read in light of postmodernist theory, Hannah Arendt provides the basis for a revised conception of the public sphere that privileges plurality and difference over consensus. Jim Johnson suggests that Villa's analysis is a thinly veiled polemic against critical theory. Johnson argues that, as critique, Villa's argument is neither decisive nor encompassing, and that as polemic it blinds Villa to potentially fruitful disagreements with critical theorists. Villa replies that Johnson misses the synthetic thrust of the original article because he identified public realm theory too narrowly with Habermas. Thus, he misconstrues the dialogue Villa sought to facilitate between Arendt and postmodernism.

COMMENT

There are the sterilizing effects: Has anyone ever seen a new idea come out of a polemic?—Michel Foucault, Polemics, Politics, and Problemizations

In his article "Postmodernism and the Public Sphere," Dana Villa (1992a) disputes the way political theorists currently conceptualize the public sphere. In particular, he objects to those who identify Hannah Arendt's rendering of the public sphere as a model for "a dialogical, consensus based politics" (see Villa 1992b, 274). Jürgen Habermas is, if not the only, certainly the main culprit here. His "polemical stance," according to Villa, both exaggerates the opposition between critical theory and postmodernism and fosters common misperceptions of Arendt's relation to these competing theoretical projects (p. 713). Villa wants to rectify these misconceptions. He aims to answer Habermas' polemic and thereby to prompt us to reconsider the relation between postmodernism and Arendt's defense of publicity (pp. 713, 717). His strategy has three parts. First, Villa advances a set of postmodern objections intended to discredit Habermas' normative ideal of the public sphere. Second, he seeks to show how Arendt's defense of the public sphere—interpreted as the locus of "a politics that stresses plurality, difference, spontaneity, and initiation against the regularizing apparatus of consensus" (p. 719)—more successfully meets these objections. Third, on that basis, he seeks to establish, albeit with certain important reservations, a set of affinities between Arendt's work and postmodern theory.2

In short, Villa aims to deploy postmodern skepticism against the rationalist modernism embraced by Habermas. Then, having discredited critical theory, he seeks to distance himself from what he takes to be the unattractive positions of his erstwhile postmodern allies. In the course of his argument, however, Villa himself resorts to polemic. The most obvious

cost of his polemical stance is that it blinds him to possibilities for an enlarged and enhanced debate, one that might lead beyond the present impasse between postmodernism and critical theory. I try to convey the extent of this cost by indicating, without fully elaborating, several points of engagement that Villa overlooks. I present these as *questions*; the problem is not that Villa fails to answer these questions but that his polemic prevents him from raising them (or similar ones) in the first place.

The issue here is not whether one or another side gets Arendt "right." Villa himself concedes that Habermas captures a central theme of Arendt's thought (p. 713). And her work is clearly rich enough to sustain more than one defensible reading. So my purpose is not to challenge Villa's interpretation of Arendt. Similarly, the issue is not whether Habermas' portrait of the public sphere (or the larger theoretical project of which it is a part) is above criticism. It surely is not. And my intention is not uncritically to endorse his project. The issue, rather, can be captured in three related propositions: (1) the postmodern arguments that Villa advances against critical theory are not as decisive as he seems to think; consequently, (2) the range of theoretical alternatives that emerge from Villa's proposed rethinking of Arendt's relation to postmodern theory is unjustifiably truncated; and (3) (perhaps most importantly) polemic is not a fruitful mode for conducting theoretical disagreements. I shall elaborate on each of these propositions in turn.

RESPONSES TO POSTMODERN OBJECTIONS

Villa advances what he considers to be "the three most basic and forceful" postmodern objections to the normative ideal of the public sphere as a site of unconstrained political debate and deliberation (p. 712). The *power objection* challenges the ideal of a public sphere as the locus of a dialogical politics. He

disparages this ideal for "its naive reliance upon conditions of symmetry, nonhierarchy, and reciprocity as adequate guarantees of a 'coercion-free' space" (p. 715). He contends that it neglects the operation of what Foucault calls disciplinary power, which, because it functions through insidious, continuous, ubiquitous mechanisms of surveillance and normalization, demonstrates that "hierarchy and asymmetry (the two primary villains according to public realm theory) are not essential" to the operation of power in modern society (p. 715). Consequently, the normative ideal of a public sphere is a radically inappropriate remedy for disciplinary power.

The epistemological objection contends that the ideal of a public sphere is "parasitic on an Enlightenment metanarrative of emancipation" (p. 716). As such it is at odds with the defining feature of the "postmodern age," namely, a widespread "incredulity toward metanarratives" generally and toward that of political emancipation in particular (Lyotard 1984, 3, xxiv). From this perspective, Habermas' "attempt to delineate the public sphere in terms of a specific form of interaction and the rationality appropriate to it" appears especially suspect. This is because it threatens to regularize—and thereby suppress—not only "the irreducible heterogeneity of language games" but the plurality of voices that might participate in such games (p. 716).

Villa thinks that the third, ontological objection, is "in some ways the most telling" criticism that postmodern theorists level at the ideal of a public sphere (p. 712). It questions "the specific reality claimed for the public sphere and the objects within it" (pp. 712, 716). And, while Villa does not develop this theme, he intimates that it highlights the dubious (because abstract and procedural) characterization that Habermas gives to the public sphere.

I will now suggest how critical theorists might respond to these postmodern objections. In each case, they confront pressing and difficult issues. But in no instance are the objections Villa raises to critical theory as decisive as he would have us believe. Thus they provide no clear warrant for preferring Arendt's rendering of the public sphere (as Villa reinterprets it) to the normative ideal that critical theorists advance. I do not present these responses as decisive refutations. I simply wish to indicate that despite Villa's conclusive tone, room exists for potentially productive disagreement on the issues that he raises. Again, my aim is to highlight missed opportunities—to raise questions, not to provide definitive answers.

Power

Habermas (1989a) locates the rise of the bourgeois public sphere in the eighteenth century. Foucault locates the perfection of disciplinary power during the same historical period. He argues that "the development and generalization of disciplinary mechanisms constituted the other, dark side" of the processes that Habermas traces. More strongly, Foucault asserts that "those systems of micro-power that are

essentially nonegalitarian and asymmetrical that we call the disciplines" provided the necessary, unavoidable "foundation" for the emergence of a liberal democratic politics. And he goes on to explain that disciplinary institutions "have the precise role of introducing insuperable asymmetries and excluding reciprocities" (Foucault 1979, 222 emphasis mine). His most telling example of the asymmetrical, hierarchical, nonreciprocal nature of disciplinary power is Jeremy Bentham's panopticon. In this quintessential disciplinary institution, "each individual, in his place, is securely confined to a cell from which he is seen from the front by a supervisor; but the side walls prevent him from coming into contact with his companions. He is seen but he does not see; he is the object of information, never a subject of communication" (p. 200 emphasis mine).

These passages are neither obscure nor easy to reconcile with the conventional postmodern interpretation of Foucault that Villa accepts without hesitation. They also are difficult to reconcile with the categorical assertion Villa makes on the basis of that interpretation, namely, that hierarchy and asymmetry are not essential to the functioning of disciplinary power (p. 715). The issue here, once again, is not simply who gets Foucault "right." The issue, rather, is whether Villa's objection to the normative ideal of a public sphere is well specified. If, as the quoted passages suggest, hierarchical, asymmetric, nonreciprocal relations are central to even disciplinary forms of power, the project of specifying an idealized model of unconstrained political discourse, though difficult in ways that I shall indicate, is hardly as ill advised as Villa makes out.4

A less conventional and, I would argue, less polemical interpretation of Foucault opens possibilities for debate. For instance, if the perfection of disciplinary institutions represents the "dark side" of political modernity, do such institutions, as Foucault seems to suggest, find their inescapable normative counterpoint in claims to reciprocal, symmetric and equal communication? Conversely, how, if at all, could critical theorists articulate the possibility that uncoerced public communication might, as Habermas intimates (1992, 74–75), be extended from overseeing familiar political and economic institutions (e.g., state and market) to interrogating other decentralized, but nonetheless systematic operations of social power (e.g., social norms)?

Epistemology

As Villa reports, Lyotard "famously defines" postmodernity as consisting in a thoroughgoing suspicion toward modernist metanarratives generally and toward the metanarrative of political emancipation in particular (p. 716, emphasis mine). But this definition of the postmodern age seemingly neglects a quite plausible yet disconfirming interpretation of the most momentous political events of our time. As Habermas points out, the revolutions of 1989 in East Cen-

tral Europe were hardly made under the banner of postmodern skepticism (1990a, 7–8). They drew upon the well known repertoire of modern political protest. And they were animated—if not exclusively, at least conspicuously—by key ingredients in the modern narrative, namely the legitimating ideas of truth, justice, liberty, and popular sovereignty. Any account of so complex a set of events is necessarily incomplete, hence contestable. Postmodern theorists will no doubt advance rival interpretations. But is it not at least arguable that, as Habermas suggests, modernity is "extending its borders" rather than retreating in the face of postmodern skepticism?

Empirical evidence, however desperately needed in disagreements of this sort, is unlikely to resolve this question. But it surely provides warrant for questioning whether Lyotard's *definition* of the postmodern condition by itself embarrasses efforts to articulate a normative ideal of a public sphere. As events suggest, postmodernists seem greatly to exaggerate the demise of what they call the modern metanarrative of emancipation. What, then, prevents critical theorists from drawing upon that narrative, or its components, to ground criticisms of the homogenizing, exclusionary potential that postmodern theorists hold is inherent in any vision of a democratic public sphere?¹⁰

Ontology

Villa himself concedes that this third objection is less relevant to Habermas than to Arendt (p. 716). But he complains that "Habermas is able to evade it" only by grounding his defense of publicity in "an abstractly procedural account of discursive rationality" (p. 713). Villa resists this "evasion" without explicitly stating why. Yet he nowhere asks whether critical theorists are necessarily committed to Habermas' quite strong formulation of communicative reason (McCarthy 1992, 3, 181–99).

Critical theorists surely aspire to ground their ideal of the public sphere in a notion of communicative reason. But do they need to understand this as a regulative idea, something toward which practices in fact aim? Might they not understand it, more modestly, as a critical ideal—a counterfactual vantage point from which to assess and challenge extant political practices and institutions? Foucault for example, countenances the latter possibility. He concedes that "the idea of a consensual politics may indeed at a given moment serve either as a regulatory principle or better yet as a critical principle with respect to other political forms," subsequently settling on the second interpretation. Thus the ideal of a consensusbased politics is a critical idea to maintain at all times: first, one asks oneself "what proportion of nonconsensuality is implied in such a power relation, and whether that degree of nonconsensuality is necessary or not, and then one may question every power relation to that extent" (1984, 378-79).11

This defense of the public sphere raises pressing theoretical questions. Can critical theorists articulate the seemingly common normative criteria that both tacitly inform Foucault's critique of disciplinary power and explicitly undergird their own defense of the public sphere? Can they specify more persuasively the individual competences and social conditions necessary to make understanding, if still improbable, at least conceivable (Johnson 1991, 1993)? Are there reasons to think that critical theorists cannot address such questions? Villa surely does not offer any.

In the end, then, Villa's objections to critical theory are contestable in ways I have indicated. Given his confident tone, this conclusion is disturbing in itself. But the sorts of question I have raised highlight a further, especially baleful consequence of his argument. Villa unjustifiably circumscribes the range of viable theoretical alternatives precisely because he never even entertains the possibility that critical theorists might advance a more supple, modernist defense of the public sphere.

NIETZSCHE OR ARISTOTLE?

MacIntyre (1981) posed this dilemma more than a decade ago. Villa concludes that we face an updated but similarly glaring antimodernist predicament: postmodern skepticism *or* premodern nostalgia (p. 719). Simply because he arrives via an alternate route neither makes this choice appealing nor renders it inevitable. Indeed, it is ironic to find Villa calling on postmodern theory in order to recapitulate existing dichotomies. This, however, is what his proposed rethinking of the relation between postmodernism and the public sphere leads him to do.

There is one condition under which the impoverished range of theoretical alternatives that Villa offers is justifiable. Neither critical theorists nor others must be able to advance a cogent modernist defense of the public sphere, where one minimal criterion of cogency is that any such defense address postmodernist concerns. Does this condition hold? Villa never asks. Instead, he actively suppresses opportunities to actually engage critical theory and thereby to enhance rather than stifle theoretical discussion. ¹⁴ I have already implicitly identified several such missed chances. Here I will very briefly suggest two more.

First, Villa might push critical theorists to develop the *remarkable* rather than the predictable themes in Habermas' essay on Arendt. ¹⁵ I refer to Habermas' firm reminder that "strategic action has taken place also within the city walls" and that therefore any adequate conception of politics must incorporate a robust, nonresidual role for strategic interaction (Habermas 1983, 180, 183). Might critical theorists take this observation as an opening from which to explore how (or whether) to address what postmodern theorists call the "agonistic" dimensions of social and political interaction? ¹⁶

Second, Villa might push critical theorists to confront an apparent, especially relevant tension, internal to Habermas' theory of communicative action. On the one hand, Habermas presumes that actors are

communicatively competent—that they not only can, but necessarily do, embed their utterances in a system of contestable validity claims. On the other hand, he also insists that actors are endowed with "linguistic competence" and that this mastery of the grammatical rules of a natural language grounds a capacity not simply to formulate "comprehensible" utterances but to do so in innovative ways and under novel circumstances (Habermas 1979, 20, 26–27). Does this tension between constraint and creativity provide an opening from which critical theorists could more adequately address postmodern qualms about the potential homogenizing effects of communicative reason?

These are hard questions. Critical theorists need to pursue answers to this sort of question in order plausibly to defend the normative ideal of the public sphere and thereby avoid Villa's stark antimodernist predicament. Villa offers no reason to think that they cannot do so. Indeed, because he is engaged in a polemic Villa never even acknowledges the opening these sorts of question provide. Consequently, despite his professed concern for the exaggerated sense of opposition between postmodernism and critical theory, Villa's argument has the effect of exacerbating rather than easing existing theoretical divisions.

POLEMIC: HOW NOT TO PURSUE POLITICAL THEORY

Villa complains that Habermas adopts a "polemical stance" toward postmodern theorists. His complaint seems warranted. Habermas, who is well known for openly engaging theoretical rivals and critics, is perhaps uncharacteristically harsh when he discusses postmodern theory. ¹⁷ Villa's complaint also is ironic, for it tacitly invokes an ideal of free and open debate that Villa subverts in his own practice.

that Villa subverts in his own practice.

Consider in this respect the "essential" distinction Foucault (1984, 381–82) draws between entering discussion and engaging in polemic. Discussion is "a game that is at once pleasant and difficult." In it participants implicitly undertake commitments entailed by "the acceptance of dialogue" and avail themselves only of rights that "are in some sense immanent" in "the dialogue situation" itself. In polemic, by contrast, the aim is not simply "to wage war" but to regard "that struggle as just undertaking." The polemicist proceeds unconstrained by mutual rights and commitments, and treats each interlocutor not as "a partner in the search for truth, but an adversary, an enemy who is wrong."

Villa is waging a just war in Foucault's sense. To that end he deploys an arsenal of polemical weapons. He offers as conclusive readings of texts that, however conventional they may be, can at best be held tentatively. He argues by definition. He presents as inevitable a theoretical predicament that in actuality is an artifact of his own argument. And even if we grant that Habermas adopts a polemical stance

toward postmodern theory, Villa never acknowledges—let alone addresses—other critical theorists who adopt less contentious approaches. 18 By proceeding in this way Villa encounters performative contradiction: he endorses postmodern impertinence, parody, and skepticism against a suppressed normative background that alone gives credence to his complaints about polemic. But more importantly, the rigors of the campaign blind Villa to the possibility of the sort of principled and productive discussion that Foucault professed to enjoy. 19 His polemical stance prevents him from asking-let alone resolving—the sorts of question I have raised in this comment. With the possible exception of Arendt, Villa leaves all parties in their original places. The primary difference is that their positions are now entrenched, rigidified, less susceptible to reformulation. By his example, then, Villa also regrettably answers no to the question Foucault poses in my epigram. Critical theorists, postmodernists, and others should take note.

JAMES JOHNSON

University of Rochester

RESPONSE

Toward the end of his response to my essay on public realm theory and postmodernism, James Johnson complains that "with the possible exception of Arendt, Villa leaves all parties in their original places." This is, for reasons I shall detail below, a revealing and remarkable claim, one that implicitly dismisses the public realm theory of Hannah Arendt and endows Habermas' theory with an unquestionable hegemonic status. Johnson finds no "new ideas" in my essay because he identifies public realm theory solely with Habermasian theory. Hence, he misses the synthetic thrust of my essay, which attempts to overcome the hardened opposition between public realm theory and postmodernism specifically by opting for Arendt's theorization of an agonistic public sphere over Habermasian proceduralism.

Let us look, first, at the charges. Johnson accuses me of eschewing productive discussion in favor of polemic, a choice that dooms any attempt to rethink positively the map of contemporary theory. According to Johnson, my polemical intent guarantees that no genuinely new configuration between modern public realm theorists and their postmodern opponents will appear; rather, old battle lines will simply be redrawn, old oppositions sharpened, and the potential for fruitful dialogue dismissed. Johnson asserts that the reader of my essay who expects an aufhebung of the modern-postmodern debate (or, at the very least, a step forward) will be sorely disappointed. Instead of overcoming the baneful either/ors of contemporary theory, Johnson thinks my essay merely shifts them, concluding with a dichotomy

(Nietzsche or Aristotle) every bit as exhaustive and undialectical as the Habermasian one I attack.

What is interesting about this charge is the way it surreptiously transfers Habermas-size ambitions to me, such as the desire to provide an exhaustive mapping of the world of contemporary theory. This desire clearly animates The Philosophical Discourse of Modernity, with the binary of "subject-centered reason" and its critics on the one hand and the "paradigm of mutual understanding" on the other. Johnson agrees with me that the thick black line that Habermas draws between the two paradigms is reductionist but thinks that I am trying to refute Habermas simply by drawing another, equally reductionist, boundary. Johnson sees such boundary drawing as perpetuating a theoretical Punch and Judy show. He wants us to put down our paint brushes and get on with the serious business of working out the kinks of critical theory in general and public realm theory in particular.

My essay does not substitute my global map of theory of Habermas'; rather, it questions the adequacy of Habermas' mapping and suggests that the rigidity of his dichotomy has underscored a largely false opposition between public realm theory and postmodernism/poststucturalism. As I point out, it is to the discredit of many postmodern theorists that they largely accept this opposition as fact. My essay suggests that this opposition has been reified; that the politics of public realm theory are more complex, ambiguous, and subtle than many Habermasians or postmoderns assume; and that the unique public realm theory of Hannah Arendt opens channels of communication between public realm theory and postmodernism in a way foreclosed by Habermas.

My goal in presenting an overview of public realm theory as construed by the Habermasians and various postmodern objections to such theory was not to resolve this difference but to show the way the terms of the debate had been set. The strategy of the essay is first to focus on the opposition and then to show how Arendt's public realm theory straddles it. It is because Arendt theorizes an agonistic public sphere that many of the more typical postmodern objections to public realm theory have little purchase on her. Thus the heart of my essay is found in its distinction between public realm theory as practiced by Habermas and public realm theory as practiced by Arendt (a distinction that has been largely obscured by the Habermasian appropriation of Arendt). With this distinction in mind, new possibilities and configurations become possible between postmodernism and (a more Arendtian conception of) public realm theory—hence my emphasis on how Arendt's theory can answer many of the objections raised by postmodernism/poststructuralism to public realm theory of the Habermasian sort. Of course, there are differences between Arendt and Foucault, Lyotard and others-differences I tried to highlight with my final contrast between Arendt's nostalgia for a public reality and the postmodern affirmation of the blurring of boundaries (a decidedly un-Arendtian ambition).

My essay, then, does not offer up the choice between "postmodern skepticism" and "nostalgia for the premodern" as a substitute for the Habermasian dichotomy between public realm theory and the concerns of the postmoderns. Rather, it suggests an unexplored avenue of dialogue or synthesis, while reminding the reader that Arendt's agonism retains its specificity. In other words, thinking the public realm with Arendt rather than Habermas enables us to overcome many of the roadblocks to the kind of theoretical dialogue or synthesis Johnson thinks so salutary. Why, then, the fuss about polemic and the shutting down of theoretical dialogue? Why does Johnson read my essay as repudiating, rather than furthering, a potential dialogue between postmodernism and public realm theory?

The obvious answer is that Johnson identifies "public realm theory" with the Habermasian project, broadly construed. If one begins with the assumption that Habermas has a monopoly on public realm theory, that he has established a normative paradigm that englobes public realm theory tout court, then it becomes possible to say, with Johnson, that "with the possible exception of Arendt, Villa leaves all parties in their original places." Unfortunately, nothing of the sort takes place. I have, on the contrary, shown that the "abyss" that separates postmodernism and public realm theory is much narrower than supposed. What irks Johnson (and leads him to miss the synthetic character of my essay) is that I do not share his presumption that public realm theory is Habermasian critical theory or that Habermas establishes a theoretical horizon within which all talk of the public sphere must invariably occur. Following Arendt, I think there are other, more fruitful ways of talking about the public sphere—ways that keep plurality, debate, and difference alive rather than seeking to shut them down via a formalistic decision procedure. Because Johnson believes that the only relevant dialogue is between Habermas and his critics, he dismisses the dialogue I am attempting to facilitate between Arendt and postmodernism. Needless to say, I think this stacks the dialogical deck a little too much: there are other, equally important conversations to be had in contemporary theory.

Once we acknowledge that the modern-postmodern debate opens up a number of conversational avenues worth exploring, not just one, Johnson's lengthy list of complaints is put into perspective. Those who, like myself, find postmodern objections to public realm theory à la Habermas persuasive are apt to seek out different, less global, models of the public sphere. Those who, like Johnson, find these objections either unconvincing or answerable may well remain committed to Habermas' discursive model. The conversation one pursues largely depends upon one's reaction to the various criticisms voiced by Foucault, Lyotard, and others. My essay assumes that these criticisms have some bite and that public realm theory would do well to take account of them, specifically by abandoning a strong normative conception of the public sphere for a more flexible,

phenomenological approach. Johnson, given his allegiance to Habermas' discursive paradigm, proposes a different sort of "taking account"—one that continues to treat the discursive model of the public realm as normative. Here we can agree to disagree. What I find peculiar is Johnson's insistence that I write the essay he would have written on the topic of postmodernism and the public sphere. Having failed in this regard, my essay is branded mere polemic.

Johnson accuses me of "waging war" rather than engaging in "the search for truth" because the conversation I wish to promote is not the one he deems important. His deployment of Foucault's comment about polemic is designed as a kind of coup de grace—a damning at the hands of the "master" that places my essay outside the bounds of civilized theoretical discourse. Even Foucault, Johnson triumphantly declares, believed in the Socratic virtues. It may come as a surprise to Johnson, but so do I. However, like Foucault—and, indeed, like Arendt—I am all too aware of how the Socratic virtues can be codified as an exclusionary and silencing discursive rationality. Johnson's "nonpolemical" comments end by banishing me from the dialogue of political theory. The irony, I presume, is intended.

DANA R. VILLA

Amherst College

Notes

Thanks to Jack Knight and Stephen White for very helpful comments on earlier drafts.

- 1. Habermas is not Villa's only culprit. Other critical theorists, such as Richard Bernstein and Seyla Benhabib, are also at fault (p. 714). And many postmodernists are complicit insofar as they accept Habermas' interpretation (p. 719, n. 6).
- 2. Specifically, Villa claims that Arendt "avoids the relativist consequences of postmodern pluralism" by appealing to a shared understanding of the world and that she adopts a different "attitude" than do postmodernists to the subversion of "a distinctly political realm" in the modern world (p. 719). These reservations about Arendt's relation to postmodern theory come out more clearly elsewhere (see Villa 1992b).
- 3. Thus, Foucault explains that as it emerged, disciplinary power had to "solve a number of problems" that other forms of power were ill equipped to address: specifically, it had to "master all the forces that are formed from the very constitution of an organized multiplicity; it must neutralize the effects of counter-power that spring from them and which form a resistance to the power that wishes to dominate it: agitations, revolts, spontaneous organizations, coalitions—anything that may establish horizontal conjunctions" (Foucault 1979, 219, emphasis mine). And since, as Foucault insists, "there are no relations of power without resistances" (1980, 142), disciplinary mechanisms must continuously perform this task of introducing asymmetries and subverting reciprocities.
- 4. This is especially so because, as Foucault explicitly claims, disciplinary mechanisms do not exhaust the entire range of modern power relations (1980, 106; 1984, 380).
- 5. Jacques Derrida once explained to an interviewer, "I cannot conceive of a radical critique which would not be ultimately motivated by some sort of affirmation, acknowledged or not" (Kearney 1984, 118). Foucault, despite conventional readings of his work, implicitly seems to exemplify this reminder.
 - 6. This statement might seem miscast to those who see

Lyotard as making a normative rather than an empirical argument. But this objection is difficult to sustain. While Lyotard clearly advances a normative argument, that argument just as clearly presupposes empirical—and hence fallible—claims regarding the nature of the "postmodern world" (1984, 41). Consider, for example, his claim that "the word postmodern . . . designates the state of our culture" and his explicitly offering his views on the altered status of knowledge in our postmodern culture as a "working hypothesis" (Lyotard, 1984, xxiii, 3). Or consider that he himself invokes a litany of Western and Eastern European events as "evidence" that the modern narrative of emancipation has not simply "been forsaken or forgotten, but destroyed, 'liquidated'" (Lyotard 1992, 28–29, 18).

7. Similarly, Western responses to 1989 and its aftermath, where they have not been purely opportunistic, have arguably been animated by modernist impulses.

8. Postmodern theorists will no doubt distrust Habermas' reading of events. Before too quickly dismissing his account, however, they might consider Timothy Garton Ash's first-hand assessment of how distinctly modernist ideas influenced Central European events in 1989 (1990, 105, 154).

9. In Central Europe today, if modernity is besieged, it is by the sort of ethnic hostility, xenophobia, and so on that transforms the "difference" and "otherness" that postmodern theorists celebrate into violent enmity (Tismanaenu 1992, 3, 279–88). Nevertheless, besieged does not mean overwhelmed: Do either postmodern theorists or Arendt have a superior, coherent response to this trend that does not derive its force from the modern narrative?

10. I have in mind here the task of elaborating on the possibility of what, in his recent political writings and interviews, Habermas repeatedly refers to as "autonomous public spheres" (Habermas 1989 b; 67; 1990a, 18; 1992, 183; emphasis mine). Nancy Fraser (1992) has initiated this task in a fair but pointed criticism of Habermas. Villa views her efforts as "quasi-Lyotardian" (p. 720, n. 10). Yet if Fraser draws conclusions about the proliferation of public spheres that post-modern theorists might find congenial, Villa neglects to note that her comments are unmistakably motivated by the modernist agenda of publicity, equality, pluralism, and democratic self-determination. For a similar argument, see Young 1989 on the notion of a "heterogeneous public."

11. This comports with Habermas' view that the idealized conditions of discourse are "counterfactual" and his claims about the limits of social theory (1984, 42; 1992, 60, 92–93, 160–61, 168, 180). In fairness, Villa seems at times to countenance precisely this reading of the public sphere (pp. 712–13); but he never fully articulates his views. Moreover, he offers a partial reading of this passage from Foucault that belies such an interpretation of his position (p. 719, n. 2).

12. This is not quite so easy as critical theorists might initially suppose, especially if they hope to confront squarely postmodern suspicions that communicative reason is irremediably "regularizing." Minimally, it would require that they disentangle a set of issues that Habermas' own language tends to obscure. For example, reaching understanding (according to Habermas, the implicit telos of language use) does not in any straightforward way entail consent (according to Habermas, the mechanism by which speech acts coordinate social interaction). Nor need it issue in consensus or agreement. Shared understandings may, in fact, ground profound disagreement.

13. Villa's predicament is even starker than MacIntyre's insofar as he provides no criteria for determining which political "attitude" one ought to adopt when confronted by the "choice" he offers.

14. This is so even in Villa's lengthy final footnote. Referring to Fraser (1992), he admits—but does not explore—the possibility that our predicament might not be quite so dire as he makes out, that there may be alternatives other than "the purely mournful or subversive attitudes" he acknowledges in the text. But he also asserts without argument that the notion of the public sphere upon which such an alternative rests "ceases to function in an essentially normative capacity" (p.

720, n. 10). This view reflects Villa's failure, noted earlier, to recognize the essentially modernist impulses that inform Fraser's criticism of Habermas.

15. Here, as with Foucault, Villa is ill served by conven-

tional interpretations of texts.

16. See Johnson 1991 on the difficulties Habermas has in treating strategic action. In any case, insofar as postmodern theorists include expressive and aesthetic as well as strategic dimensions in "agonistic" relations, what I depict as an opening is just that—a potential beginning, an invitation. Here, Habermas' cryptic discussion of "dramaturgical action" with its roots in Goffman's (1959) analysis of "the presentation of self" might afford still another point of departure for discussion between postmodernists and critical theorists (Habermas 1984, 90-94). For Lyotard specifically cites Goffman among the sociologists who contribute to our understanding of the agonistic dimensions of social relations (1984, 16-17, n. 60). This conversation might explore such issues as whether (and when) expressive actions really are, as Villa claims (p. 718) and Goffman denies, nonteleological.

17. Habermas views the debate between postmodernists and critical theorists in terms that mirror those that Villa poses. As Habermas remarks: "The contrast between rationalist approaches in Germany and post-structuralist approaches in France is being quite unnecessarily exaggerated at the moment. . . . I can scarcely recognize myself in the caricatured image of my theory that is sometimes drawn in

this dispute" (1990b, 127).

18. For instance, he fails to acknowledge White (1991) and McCarthy (1991); but see Villa 1993. In any case, from reading Villa, one would never guess that Habermas does not fully and unambivalently embrace modernity, that he considers it a precarious achievement and that he is critical of the one-sided (hence incomplete) way in which it has developed.

19. This is not simply an idiosyncratic predilection: "A whole morality is at stake, the morality that concerns the search for truth and the relation to the other" (Foucault 1984, 381). It nevertheless goes without saying that discussion can be frank, pointed, even heated and that it can be enlightening without issuing in agreement.

POLITICAL THEORY

Democracy and Decision: The Pure Theory of Electoral Preference. By Geoffrey Brennan and Loren Lomasky. New York: Cambridge University Press, 1993. 237p. \$44.95.

Geoffrey Brennan has coauthored, with James Buchanan, a seminal work in constitutional political economy, *The Reason of Rules*, and *The Power To Tax*. Loren Lomasky is a philosopher interested in questions of authority and rights. After previously coediting a book, *Politics and Process*, together, they have now jointly written an important new book, *Democracy and Decision*, which is a critique of public choice theory as it applies to the electoral arena.

At first blush, this is the best of times for public choice theory and its political science alter ego, positive political theory. With a Nobel Prize in economics to leading practitioner James Buchanan, public choice gained added legitimacy in economics, while in political science, theorem-laden articles appear in the discipline's leading journals with regularity. In the Twenty-Fifth Anniversary edition of *Public Choice*, Dennis Mueller, author of the leading public choice textbook, opines, "It is difficult to believe that political science will not be taken over by formal modeling of rational actors' behavior in the same way that economics has been. Inductive theorizing invariably loses out to deductive; less formal modeling invariably loses out to more formal modeling" (77[1993]: 146).

But all is not roses for rational choice modelers. In political science, the rise of rational choice modeling has led to a reaction of epic proportions, similar in tone to the antibehavioral movement of the late fifties and early sixties and directly comparable to the (unsuccessful) rearguard fight of older economists against the increased use of mathematics in that profession after World War II. According to Mueller, "While [that] takeover was occurring, complaints could be heard that the new techniques 'were not economics', were being used 'to reinvent the wheel', were 'divorced from reality', and the like" (ibid.): by simply substituting political science for economics in this quote, we obtain the basic argument of the current rational-choice bashing repertoire in political science. All that we need to add is the common accusation that public choice is just a cover for right-wing ideas.

If anti-public-choice sentiment were confined to political scientists of a humanist (or left-wing) persuasion, we might be able to dismiss it as simply old-fogeyism or leftist paranoia; but concern about the lack of realism and lack of explanatory power of rational choice models is widespread and is found even among practitioners of public choice and positive political theory. In particular, there has arisen a concern that public choice models in their purest form (i.e., ones based on a narrow definition of self-interest or a monomaniacal focus on a single goal such as electoral victory) simply miss too many important features of politics. Thus, we have Morris Fiorina titling a 1991 paper "Is Turnout the Paradox That Ate Rational Choice Theory?," while William Niskanen goes even further, suggesting that although public choice has become a recognized field of academic study, "it is not clear that we have much to tell the rest of the world." Niskanen then goes on to note that public choice theorists not only cannot answer such questions as "Why do people vote?" but "have no satisfactory explanations of the major political developments of our lifetime: the massive expansion of government budgets and regulation, the erosion of the economic constitution, and the progressive spread and recent collapse of communism" (Public Choice 77(1993):155).

Democracy and Decision is reflective of this critique of public choice from within the subfield. While critical of public choice theories of voter behavior, it does not in any way reject the standard tools of microeconomics and applied decision theory, and, like Howard Margolis' work on altruism, it offers new models to help account for findings that appear largely inexplicable within a framework of pure self-interest narrowly defined. The central contribution of Democracy and Decision is the working out of a theory of expressive voting, whereby Brennan and Lomasky mean voting behavior that is not connected to an impact on outcome—like cheering for a team while watching them on television, even when you are alone at home.

My economist colleague Ami Glazer, also an exponent of an expressive model of voting, has suggested that "the ballot box is the last place where it is still legal to be a racist." Brennan and Lomasky argue that the ballot box is also a place where it is not particularly costly to be an altruist; that is, they turn the "selfish voter" argument on its head, by pointing out that because a voter is unlikely to be decisive, voters are much freer to vote in a way that makes themselves feel good by enhancing their self-image as ethical, principled beings. The argument is made nontautological by the assertion "All other things being equal, the relative significance of expressive elements increases by a factor equal to the inverse of the probability of being decisive" (p. 24). Thus, Brennan and Lomasky are able to say that homo economicus is generally a reasonable model for decisions about personal consumption but is, nonetheless, a bad model for choices in the public arena. Just as recent work by Donald Wittman (on competition for voters) or Norman Schofield (on cabinet formation) models parties as caring about both ideology and about winning, the Brennan and Lomasky book shows that allowing for expressive forms of voter preference and for multiple goals need not mean rejecting the value of formal modeling or of a rational choice approach, broadly speaking.

Brennan and Lomasky are able to trace both empirical and normative implications of viewing politics in terms of expressive choices. Normatively, they note that preferences revealed at the ballot box will not have the same claims to authenticity in terms of what economists call "demand revelation" as do preferences about private goods expressed through market choice. Empirically, they suggest how the expressive voting model can help account for a wide range of phenomena—from why facts and allegations about the private lives of public figures weigh into voter decision making to why public attitudes toward Social Security hinge more on perceptions of fairness than on the incidence of costs and benefits

across generations.

There is no such thing as the rational choice model of any given phenomena, only a rational choice model. For example, even though the minimal winning coalition model does not work well in most countries in explaining cabinet coalition formation, this is no reason to give up on rational choice models of coalition building. The usefulness of any given model-rational choice or other -must be in terms of the insights it provides us to the particular phenomena we are seeking to understand and explain. Informed by common sense and focused on the substance of electoral politics, Democracy and Decision carefully steers between the Scylla of abstract rationalchoice bashing without the offering of superior alternatives and the Charybdis of confusing degree of technical elegance or mathematical sophistication with likely social science importance.

Whatever your methodological stance, if you are interested in electoral politics, this is a book worth reading. Unlike much positive political theory, sometimes seemingly intentionally written *up* so as to remain incomprehensible to most political scientists, *Democracy and Decision* is lively and well written. Because the ideas in it suggest potentially testable alternative models in so many substantive domains, it is also a great book to give to graduate students looking for thesis topics.

University of California, Irvine

BERNARD GROFMAN

Hannah Arendt: A Reinterpretation of Her Political Thought. By Margaret Canovan. New York: Cambridge University Press, 1992. 298p. \$54.95.

Arendt, Camus, and Modern Rebellion. By Jeffrey C. Issac. New Haven: Yale University Press, 1992. 320p. \$30.00

Arendt was a theorist of the extraordinary, a philosophical poet of the preternatural: Holocaust and Achilles, concentration camps and ancient spaces of appearance, imperialism and revolutions in search of freedom. In these jarring historical and aesthetic phenomena, she located the massive dangers, as well as the possibilities, in the contemporary human condition. Future politics, in all of its possible senses, would only rise from the ashes of these multiple pasts: the brilliantly human and the hideously inhuman. No other future was an offer.

Arendt's political theory is thus not only intrinsically intriguing but precisely pertinent to many of our concerns and dilemmas. Fully cognizant of this, Canovan and Issac strive hard to unravel her complex theory and connect it to our politics. Yet their distinct readings of Arendt, interesting and suggestive, are too flawed substantively to be fully persuasive. In this sense, neither is cogent as an argument, but Canovan's study is far less compelling than Issac's in its analytic reach and accomplishments.

Long and detailed beyond the call of scholarly duty, Canovan's inquiry is not an argument about Arendt or a reinterpretation of her thought: it is an extended commentary on nearly all of her writings based on her assumption that Arendt has been "little understood" (p. 2). Two further claims buttress this one: that the "proper context" of her corpus is totalitarianism (p. 7) and that her real political theory lies hidden in her unpublished writings. No one, according to the intrepid Ms. Canovan, has really got Arendt right.

That Arendt's political theory is rooted in her encoun-

ter and engagement with the totalitarian Holocaust is not a novel theme. Kateb and many other scholars have not only insisted on this for over a decade, they have also analyzed the nuanced pathways that connect her theory and that terrible event. Canovan's stress on this point is puzzling and disingenuous. Far more troubling, however, is Canovan's doting reliance on Arendt's unpublished papers and her surprisingly uncritical attitude to them.

To Arendt, the private was usually a synonym for fantasy and falsity, a marker for those things not worth revealing to the public. Hence, a scholar who resorts to—and structures a "reinterpretation" (in fact, a commentary) on—Arendt's private, unpublished papers is under some obligation to justify her project. Canovan, however, does not, although she offers the feeble rationale that Arendt's thought is actually "inward-looking" and "esoteric" (pp. 11–12)—contrary to what Arendt herself has said and many interpreters have supposed. No evidence exists to support this outlandish claim, and none is adduced.

Nevertheless, the result of this strategy is ironic: the "insights" that she elicits from the private papers fail to shed any new light on Arendt's political theory. For example, Homer's pivotal role in Arendt's articulation of the nobility of action on which Canovan insists, is plain and patent in the *Human Condition* and in the extant published literature on Arendt. In fact, many of Canovan's breathless, analogous discoveries, based on her reading of the unpublished papers, fall into the familiar category. At best, they signal slight shifts in emphasis and occasionally add clarity, but they do not warrant a radical revision of her thought.

No novel interpretation or substantive reinterpretation of Arendt's political theory is visible in this study. Tracing the "sources" of a range of Arendt's ideas and commenting at length on them is apparently her forté. Canovan is instructive and often illuminating in her discussion of totalitarianism, barbarism and civilization, republicanism, citizenship, human plurality, and the relationship between philosophy and politics, although her tone is frequently cloying and defensive.

This peculiar style of intellectual empathy, in fact, accounts for a number of unusual but untenable claims. In her unlimited passion to "understand," Canovan zealously overreads and misconstrues Arendt's critical reflections. Two morally troubling examples should suffice. First, Canovan resuscitates the hoary canard that Arendt blamed the Jews for the terrible destruction they suffered at the hands of the Nazis (p. 44). (The only interesting question here is why she has revived this accusation.) Canovan asserts that in Arendt's analysis, "the Holocaust could never have happened" if only the European Jews "had a clear grasp of political principles" (p. 55). Not only did Arendt say nothing of the sort, but such a claim would contradict her unceasing theoretical emphasis on the radical contingency of life and politics. No credible textual evidence is produced by Canovan to support either indictment.

No less troubling is her rush to defend Arendt's solicitous analysis of white racist conduct in Africa and characterization of black natives as "savages." Canovan neither objects to, nor avoids, this label in discussing black suffering: on the contrary, she fluently explains it away as a corollary of their natural inferiority, their barbaric "worldlessness" (quoting Arendt). Canovan is not deterred, by the racist undertow in this analysis,

from depicting Arendt as a ranking theorist of universal human rights.

Habitually uncritical commentary of this kind is not an accidental facet of Canovan's study: it has its source in her lack of theoretical savvy—in her unwillingness to fashion a standpoint from which critically to assess Arendt. Canovan casually assumes what she should be explaining in many cases—for instance, that Arendt is an antifoundationalist and an existentialist. In *Hannah Arendt*, Canovan succumbs to Arendt's considerable intellectual powers precisely because of this lacuna in Canovan's scholarly template, and the result is a study that is continually struggling to justify itself.

In contrast, Jeffrey Issac has a rough thesis in mind—that Arendt and Camus are theorists of "rebellious politics" but are rebels of a peculiar kind fitted for our postmodern time, suspicious of absolutes and final answers. Neither is duped by the boundless idealism of the Left, and both are protagonists of limits and moral realism. Hence, they are rebels who offer no "solace" and no lasting solutions. As Issac reads them, these "rebels" are not conspicuously or overly rebellious: they are, in fact, pliant liberals with a taste for the kind of sly pragmatism espoused by "leftists" like Rorty and Walzer.

Not only that, but they are both committed to "the project of democratic empowerment" and universal human rights (p. 242). Camus, possibly, fits this image of the prosaic modernist fairly well, but to cast Arendt into this mold is to stretch credulity. Fecusing primarily on Camus, Issac has fashioned an interpretive net that can accommodate Arendt, but at her expense. To stuff Arendt into the Enlightenment straightfacket is badly to misread her, and Issac implicitly recognizes this: he frequently retreats from his sanguine assessments of Arendt as an American liberal.

But there is a deeper problem with this interpretation—the presumption that Camus and Arendt were intellectual equals. His literary acumen notwithstanding, Camus was hardly "an exemplary theorist" or even a "political theorist" in any precise, substantive sense (see pp. 11–12). An interest in similar themes was the legacy of a shared historical and philosophical milieu, not a sign of intellectual parity. Camus and Arendt were substantively incompatible figures: he was intellectually light, a parasitic man of letters who said a few interesting things; she was an extraordinary, original theorist of the post-Holocaust human condition, an epic thinker who uncovered new trails of thought.

This reductive strategy not only trivializes Arendt, it robs her analysis of its radicalism and reduces it to the level of Camus's trite bourgeois formulas. For instance, Arendt condemned the racism and unwillingness of Zionist leaders to make peace with the Palestinian natives. In a typically Camusian move, Issac equates this critique with Camus's staunch opposition to independence for Algeria. Camus's insolent dismissal of the colonized is a far cry from Arendt's strikingly unbiased judgment against the oppression of the Palestinians by the incoming European Jews.

Walzer's tutalege is very much in evidence in Issac's analysis. Issac's adulation of Camus and praise for his "compelling" reasons for rejecting Algerian claims (p. 205) and Issac's staging of Arendt as a theorist of limits, a pragmatist wary of utopianism, and an enthusiast of "civil society" are variations on the Walzerian passion for lukewarm liberal politics, "connected crit-

ics," and ethnic affiliation. That Arendt can be read selectively in this way is not in dispute. The crucial point, rather, is that this Walzerian reading traduces her brilliance and the unique radicalism of her political theory. For compromising politics of this sort, especially the Camusian variety, Arendt had no sympathy. To say that she "misunderstood his work" is an untenable assertion (see p. 16). On the contrary, Arendt understood precisely the bourgeois temper of Camus's mind.

Still, Issac's study is a provocative, interesting interpretation, even though he speculates well beyond the spacious bounds of Arendt's political theory. Canovan's book, on the other hand, is a profound intellectual disappointment, an immense effort that goes nowhere. Had Canovan attempted to do what, in the final pages of her faltering conclusion, she recognized she should have, she would have produced a commanding text—an interpretation of Arendt based on a "thorough assessment of the kind that cannot be attempted here" (p. 280).

SHIRAZ DOSSA

The Idea of Democracy. Edited by David Copp, Jean Hampton, and John E. Roemer. New York: Cambridge University Press, 1993. 449p. \$59.95.

This collection consists of five parts. Part 1 concerns the "point" of democracy; parts 2–4 relate democracy to "preferences," "public reason," and "economics"; and part 5 consists of cases studies. Each part contains main papers plus commentaries, with contributors from a number of different disciplines. However, the editors more or less frankly acknowledge that these divisions are procrustean and arbitrary, calling attention to the overlap between discussions in different parts. If anything, the parts correspond to different theoretical approaches, rather than dealing with separate issues. For example, the appropriateness of industrial democracy arises largely as a moral issue in part 1 (Arneson) and largely as an economic issue in part 4 (Bowles and Gintis).

Two implicit foci of debate are consequentialist-versus-nonconsequentialist justifications of democracy and the role of preferences. In relation to the first focus, Estlund considers, in a challenging but rather obscure piece, the idea that if democracy is justified by its consequences and if there are political experts, we should defer to them and so undermine democracy. His preferred response is to question whether such experts could ever be recognized and therefore whether such deference could ever be rational. Copp, in his commentary, argues that a form of government has to be judged not merely on how well it deals with social decisions but also on what sort of system it is. But this, he insists, is not to depart from the terrain of consequentialism. However, he fails to consider a familiar point that does involve such a departure and does create problems. Democracy may be valued not because it fosters autonomy (consequentialist) but because, being a system of self-rule, it necessarily instantiates it (intrinsic). The instantiation of autonomy may then be accompanied by a very poor performance in terms of the outcome of its social decisions. When Copp says, "We value democracy because we think democracy will have the best consequences for society, all things considered, and because of the kind of governance it is" (p. 115), we have

to recognize that these two things may fall apart, forcing us to decide which we regard as more important.

Preferences get discussed in a number of ways. In a general discussion, Hardin rehearses the problems in aggregating preferences recognized by Arrow and motivational difficulties connected with the free-rider problem. He argues that the same assumptions that have done wonders in explicating economic activity have exposed grievous flaws in democratic thought and practice. Christiano argues that there is an intrinsic justification for democratic control of public-collective properties, as opposed to mere preferences, which are not necessarily expressed in the act of voting anyway—thus attempting to short-circuit the Arrow problem. As for the free-rider problem, Hardin does not consider the possibility that while the requisite assumptions may be true of human beings, they may not be all that is true of them: if human beings are not exclusively self-interested agents, it may be that there are other features of their makeup that can explain and justify other forms of behavior than the economic. Sunstein enters a robust case for democratic action against people's preferences if they have resulted from unjust background conditions. He gives a long list of possible instances where state intervention might be justified but leaves matters at the level of moral intuition, rather than going on to provide reasoned justifications for them.

Where actual preferences are in some substantive sense not arrived at autonomously, the so-called paradox of emancipation arises: if you think people express preferences at odds with their own interests but you also wish to abide by democratic procedures, do you allow actual preferences to determine a suboptimal outcome or override their preferences and therefore apparently abandon democratic procedures? That is a question usefully raised by a number of these papers.

Answering it might involve raising further questions about what most of them take for granted—broadly, the fabric of existing, representative democracy. There has been interesting recent work laying down a challenge to this fabric and mooting the possibility of more participatory institutions (e.g., Fishkin's Democracy and Deliberation, 1991), but it is not discussed here. In addition, although the editors refer to the move to democracy in Eastern Europe, there is no indication that anything of theoretical importance can be learnt from that ghastly failed experiment. Roemer, it is true, urges that we should separate out the factors responsible for that failure and not just assume that one-party rule and a command economy and state ownership are equally hopeless; but his paper is concerned with the feasibility of state control of the commanding heights of the economy, rather than with the political issues. So far as democracy is concerned, it is the political component in that failure—the vanguardism with which Leninist doctrine answers the paradox of emancipation—that requires examination. Even more recent events in Eastern Europe should warn us against the thought that once indefensible doctrines have been seen off, they are never heard of again.

The collection, then, contains many interesting discussions but possesses little unity. Rawls's paper, "The Domain of the Political and Overlapping Consensus," for example, is reprinted and elicits an eloquent response from Joshua Cohen, who attempts to show that Rawls's later thinking does not lead to an abandonment of his earlier egalitarianism, as well as a penetrating

critique from Hampton designed to show that defensible liberalism cannot really be neutral. But Rawle's project presupposes a democratic political culture, rather than being centrally concerned with its justification.

Finally, any reviewer should cavil at one aspect of the production of this volume. Where articles have been published before, commentators generally refer to the pagination of the original (and in one case to the pagination of a presumably unavailable conference typescript), rather than that in the present volume. That does not facilitate scholarly enquiry.

KEITH GRAHAM

The Other Heidegger. By Fred Dallmayr. Ithaca: Cornell University Press, 1993. 232p. \$30.75.

Heidegger's Crisis: Philosophy and Politics in Nazi Germany. By Hans Sluga. Cambridge: Harvard University Press, 1993. 285p. \$29.95.

The common thread connecting these two useful books is the vexed problem of the relation between Heidegger's philosophy and his nazism. Heidegger joined the Nazi party and served as the Nazi rector of the University of Freiburg briefly in 1933–34 before resigning. The relation between his philosophical theory and his political turning is the subject of much debate, particularly since the publication of Victor Farías' book, Heidegger and Nazism, in French in 1987.

Since that time, there has been a steady stream of books in French and English devoted to aspects of the link between Heidegger's theory and his nazism. The present volumes respond to the continuing controversy. În 'The Rectorate 1933/34: Facts and Thoughts''—an article written in 1945 that only appeared in 1983-Heidegger contended that his brush with nazism was essentially meaningless and certainly so for an evaluation of his thought. Taking a similar line, Dallmayr and Sluga both acknowledge Heidegger's nazism but seek to relativize it in a way that leaves the wider theory untouched (or at least relatively so) by his political turning. Dallmayr identifies another Heidegger who is a radical critic of just what he seems to have been identified with, and Sluga shows that Heidegger's comportment was rather typical of what passed for responsible academic behavior during a rather difficult period.

I am impressed by Sluga's careful account of the philosophical background in which Heidegger turned to nazism and Dallmayr's equally careful interpretation of Heideggerian texts. Both of these books are important contributions to the continuing effort to comprehend the link between Heidegger's nazism and his philosophy. Yet I find their respective efforts to explain away (or at least severely to weaken) the importance of Heidegger's link to nazism for a grasp of his thought to be unpersuasive. As a player in the game, I believe that Heidegger's nazism is finally inseparable from his theory. Accordingly, my remarks on specific points in Sluga's and Dallmayr's books are meant to reflect my unease about their respective interpretative strategies.

Sluga's contextualist approach to Heidegger continues a tendency that has recently been featured in publications by Ott, Nolte, Farías, Bernd Martin, Thomas Laugstien, George Leaman, Claudia Schorcht, Rainer Marten, and others. He presents the most detailed view we currently possess of German philosophy in general during this terrible period. Whereas others look to the historical context to reveal the depths of the problem, he relies on a grasp of the philosophical context to show how typical Heidegger was. To make his case, Sluga talks comparatively little about Heidegger but a great deal about the surrounding view of well-known and comparatively obscure German thinkers of the period. Even if few think that talk of the good actually leads to doing the good, the extent to which German philosophers rushed to cooperate with nazism-in effect, to conduct business as usual in a changing environment—is clearly disturbing. Sluga's discussion is fascinating and sobering. He largely succeeds in his effort "to embed the story of Heidegger's personal crisis in an account of the crisis that enveloped German philosophy in general" (pp. viii-ix).

Both Sluga and Dallmayr prefer not to engage alternative ways of reading the link between Heidegger's thought and his nazism. Sluga regards the prior debate as simply factional, moralistic, and individualistic and psychologizing. Bourdieu receives special discussion early in the book for a simplified account of the philosophical context and later on for a supposedly reduction-

sophical context and later on for a supposedly reductionist approach (pp. 9–10, 247–48). Sluga argues in detail that Heidegger was not unique, since many other German philosophers turned to Nazi politics. His accounts of Heyse and Bauch are especially useful. He further innovates in two other ways. One is his careful discussion of Fichte, whose theory was appropriated by the Nazis as part of the intellectual basis of national socialism. The other is his insistance on the Nazi period as a time of crisis and the perceived crisis as a motivating

factor in the widespread philosophical turning to nazism.

The effort to incriminate Fichte as a kind of proto-nazi has been made by others, recently by Glucksmann (*Les maîtres penseurs*), although perhaps never through such detailed comparison. Yet it is unclear that Fichte's situation in 1807 and that of German nazism in the twentieth century is even roughly similar. The view of the Weimar Republic as a time of crisis is prominent in Heidegger's 1929/30 winter lecture series (*Die Grundbegriffe der Metaphysik: Welt, Endlichkeit, Einsamkeit*). Despite Nolte's urging, the fact nazism occurred in a time of crisis seems to me to be insufficient either to excuse the general academic turning to nazism or to excuse or otherwise minimize Heidegger's political turning.

Sluga's Heidegger is too much like the other thinkers of the period. We need to recall that Heidegger was the only philosopher of the first rank to rally to the Nazi cause. Among German philosophers, he was committed unusually early and to an unusual extent to national socialism. Sluga insists (correctly, in my view) that Heidegger was engaged in self-promotion (see p. 173), yet this is an instance of the psychologizing tendency that Sluga rejects. So, too, is the claim that Heidegger's nazi turning is due to his desire for his theory to have practical effects (see p. 231). For Sluga, political ideas reflect political conditions (p. 246). What about philosophical ideas in general? Is this the case for Heidegger? Did Heidegger's theory lead him to nazism?

Dallmayr's book, which consists of a series of essays (some previously published) is rightly seen as part of the current effort by Derrida, Lacoue-Labarthe, Caputo, and others to acknowledge Heidegger's nazism while recovering the still-valid part of the theory. For Dallmayr, the fascist element in Heidegger's thought is "one (easily the most deplorable) strand, but not the only and not even

the dominant one" (p. ix). To put the point bluntly but not inaccurately, breaking with the view of Heidegger as a good philosopher but a bad politician, for Dallmayr, Heidegger is a good philosopher and a good politician as well, although in a theoretical, not a practical, sense.

Dallmayr's discussion is invariably based on sensitive, generous, and occasionally overgenerous interpretation of the full range of Heidegger's writings, with special attention to the later thought. The frequent remarks on the Beiträge zur Philosophie, a still little known but central work of Heidegger's later thought, are particularly useful. Four chapters (roughly half the volume) are devoted to aspects of Heidegger and politics; the remainder ranges widely over such topics as ethics and justice, otherness, friendship, and Nishitani's version of zen Buddhism.

The effort to reveal another possible non-fascist interpretation of Heidegger's theory is plausible, since few commentators, other than Adorno, want to "reduce" Heidegger's theory to his nazi proclivities. Yet Dallmayr, who confesses to being awed by Heidegger (see p. ix), could have strengthened his case for another Heidegger by taking on the views of those who disagree with him. In some instances, such as the *Letter on Humanism*, his readings are vastly undetermined by the facts—as if Dallmayr regarded as obviously true Heidegger's own, unsupported claim that he later turned against national socialism.

The four chapters on Heidegger and politics depict a Heidegger as subversive of the established order, which is perhaps less at odds with his nazism than Dallmayr pretends. He holds that after 1933, Heidegger's corpus reflects a profound struggle against nazism without returning to traditional orthodoxy (see p. 19). But Heidegger did not even resign as rector until the middle of 1934. Dallmayr, who discusses the views of Pöggeler and Derrida, does not bolster his conviction through textual evidence. An important example is the reference to Heidegger's rejection of the nazi race theories, which is routinely used by his defenders to argue that he was not a Nazi. Dallmayr's true remark that Heidegger was unable to support "naturalism" or "biologism", does not justify his surprising conclusion that "the critique of modern ideologies (deriving from metaphysics) cannot possibly entail support for Hitlerism or National Socialism" (p. 47). Many German philosophers, including Heidegger, who were unenthusiastic about (and even clearly opposed to) such doctrines, supported nazism. Although Dallmayr reads the Letter on Humanism as opposing nazism (see p. 63), it can more plausibly be read as an effort at political rehabilitation at a time when Heidegger still held to his nazi convictions. It is correct that Heidegger was opposed to popular sovereignty (p. 104), although one misses an analysis of the Platonic nature of this claim. Dallmayr reads the first series of Hölderlin lectures as moving away from nazism, although he fails to consider the residue of folk (völkische) ideology in this document.

I share Dallmayr's conviction that Heidegger's theory is "suffused with ethical preoccupations" (p. 109). He regards Heidegger's resistance to formalized ethical theory as related to a rejection of nazism as a racial-biological theory (pp. 125, 130). He further regards Heidegger's rejection of "racial-biological chauvinism" as tantamount to the effort to choose an alternative course (p. 152), yet the texts lend insufficient support to this hypothesis. In the same way, Heidegger's traditional German philosophical emphasis on the renewal of

ancient Greece in the first series of Hölderlin lectures (p. 176) can also be read as linking his longing for Hellas with his nazism. The discussion of friendship is devoted to an uncontroversial account of Hebel. The salute to Nishitani emphasizes his concern with Western philosophy but fails to consider the link between his views and the ambiguous link of his teacher, Nishida, to fascism.

Tom Rockmore

American Democracy: Aspects of Practical Liberalism. By Gottfried Dietze. John Hopkins University. Baltimore: Johns Hopkins University Press, 1993. 290p. \$39.95.

Self-consciously, this book is in the tradition of Tocqueville, Bryce, and Laski. Its author, Gottfried Dietze, an erudite scholar and renowned teacher, is a native of the land of Beethoven, Hegel, and Goethe. He is also a long-time American resident and observer of the American people, especially their politics. Unfortunately, this book is less than we might have hoped.

It is not a closely argued book: the style is soft and remarkably, (sometimes almost randomly) discursive. For example, he writes: "Freedom does not, as Spinoza believed, produce just good. Following the Libson earthquake of 1755, an event that considerably muted the optimism of the time, the dangers of liberty were pointed out by the authors of the Federalist Papers and by Kant, who followed thoughts expressed earlier by Hobbes, Locke, and Blackstone" (p.19). The oddity of this sentence lies not only in the connection that it suggests should be made between a natural event and the political views of a wide array of philosophers, two of whom lived before it occurred. Even more strange is the implication that the authors of the Federalist in some significant way sided with Kant against Spinoza. Or is all this just rhetorical flourish?

Whatever it is, there is a lot of it in this book and mostly with uncertain effect. The author has a powerful tendency to scatter not only a wide array of little-explained references through his pages but also quotations, some extended. The general impression left certainly includes a burnish of imaginative erudition. But it also leaves one wondering once again whether arguments are just being loosely illustrated or specifically and authoritatively documented.

These difficulties carry over into the crucial problem of definitions. Liberalism, although much discussed (documented? illustrated?) is let go essentially as the desire for freedom, built into human nature and as old as man himself. Classical liberalism, a tradition with which the author identifies himself, is the same but restrained by law and principles of morality. And democracy, of which America is said to be the premier example, is passed off more than once as simply government by the people (or, at least, majority rule). The principal effect of this looseness in definition is to render the book's argument imprecise, its chapters unfocused, and even many of its paragraphs poorly structured.

Another effect is make many of the books remarks appear to be not just asides but the opinionated views of an unrepentant "conservative," especially on subjects as diverse as modern art, the morality of American youth and popular culture, and the influence on modern times of Freud, Nietzsche, and Marx. It is important to men-

tion this aspect of the book because of the possibility that other readers, including especially those who share most of Dietze's opinions, might find this book wideranging, insightful, and articulate. Even in the face of that possibility, I found Dietze's central thesis unsatisfying. That thesis, as repeatedly stated, is simply that modern-day Americans, driven by primordial needs, history, and the unrivaled characteristics of their current circumstances, have dangerously strayed far from their classical liberal roots toward a pure liberalism that preaches an absolute freedom to do whatever one wants. We have become a consumer-oriented society in the broadest sense, free to make money, move, change religions, and accumulate both things and experiences just as we please and without limit.

In general terms, this is an unexceptional thesis that few on either the Right or the Left would dispute. But unless pinned down in terms of specific propositions and supported by both carefully sifted data and rigorous analysis, it leaves major questions hanging. In the context of this book and the possible perspectives of its author, two questions are especially significant.

First, for a book whose subtitle is Aspects of Practical Liberalism, is it enough to suggest that the liberalism of America's most practical document, its Constitution, lies in its being such a bundle of compromises that people (and politicians) are free to make of it as they please? Or would it be wiser to see the provisions of that document, (e.g., those establishing the Congress as an independent body) as embodying specific conceptions of the liberal ideology? Putting the matter another way, does our liberal constitution give us a government that can govern? By what means and to what standards? In the Germanic scholarly tradition, there are powerful voices that speak to questions of this order—most importantly, Max Weber's. It is our loss that Dietze did not use his advantages to give us a Weberian analysis of the American constitutional system.

Second, much of Dietze's analysis depends on a Hartzian perspective. Although he knows that perspective through and through, he gives us no critical analysis of it, much less an appraisal of its merits. But Hartz was notably deficient in not giving us much understanding of the content of the liberalism he found consensual in America, beyond saying it was an English liberalism. But is English liberalism different from German? More importantly, are there not German voices (most notably Hegel's in his treatment of civil society in *The Philosophy of Rights*) that can be profitably interpreted as supremely revealing and critical of English (American) liberalism? Again, it is to be regretted that Dietze did not make more use of his advantages.

New York University

H. MARK ROELOFS

Life's Dominion: An Argument about Abortion, Euthanasia, and Individual Freedom. By Ronald Dworkin. New York: Alfred A. Knopf, 1993. 273 p. \$23.00.

That women have a "right to abortion" is a dogma of contemporary liberalism; that people have a "right to die" is well on its way to achieving dogmatic status. One is hardly surprised, therefore, to find Ronald Dworkin, a liberal moralist of the most impeccable orthodoxy, defending these putative rights in his new book on abortion and euthanasia.

What is surprising is Dworkin's claim that the debate about abortion and euthanasia reflects competing "interpretations" of a shared basic commitment. He suggests that those who favor abortion and euthanasia, no less than those who oppose them, believe in the intrinsic value—and, indeed, the sacredness or inviolability—of human life. Debate breaks out because the contending parties "interpret" life's value, sacredness, and inviolability differently.

For example, proponents of "abortion rights," far from denying the sanctity of human life, may, according to Dworkin, reasonably conclude "that abortion is sometimes necessary in order truly to respect life's inherent value, which depends on the intrinsic importance of human creative investment [in it]" (p. 157). For such people, as for proponents of euthanasia, the "life" that is sacred and inviolable is not "biological life" but the "human life [that] is created not just by divine and natural forces but also . . . by personal choice, training, commitment, and decision" (p. 93). They hold that "it may be more frustrating of life's miracle when an adult's ambitions, talents, training, and expectations are wasted because of an unforeseen and unwanted pregnancy than when a fetus dies before any significant investment of that kind has been made" (ibid.).

Dworkin devotes about two-thirds of *Life's Dominion* to a defense of the regime of abortion law put into place by the Supreme Court in *Roe* v. *Wade*. In certain respects, however, his account of the constitutional law of abortion is questionable. Apparently overlooking the implications of *Doe* v. *Bolton*, the companion case handed down with *Roe* on January 22, 1973, he implies that states may meaningfully protect the unborn against abortion in the final trimester of gestation. As Mary Ann Glendon has observed, however, that proposition is subject to the gravest doubt in view of the Court's holding, in *Doe*, that there is a constitutional right to abortion through the third trimester to protect maternal health and its expansive definition of *health* as including all factors, physical, emotional, and even "familial."

Dworkin maintains that the controversy over abortion, which continues to rage 20 years after the Supreme Court purported to settle the matter, "is based on a widespread intellectual confusion we can identify and dispel" (p. 10). He assures us that "once the confusion has been identified, we will see that a responsible legal settlement of the controversy, one that will not insult or demean any group, one that everyone can accept with full self-respect, is indeed available" (pp. 10–11).

What is the alleged confusion? Dworkin maintains that public debate largely fails to recognize a "crucial distinction" between objecting to abortion because it violates the right of unborn human beings not to be killed (the derivative objection) and objecting to abortion "because it disregards and insults the intrinsic value, the sacred character, of any stage or form of human life" (the detached objection) (p. 11). The derivative objection, he maintains, is unsound because human fetuses, nearly until birth, lack all "interests," including "an interest in surviving," and therefore cannot have a right not to be killed (pp. 18-19). The detached objection, by contrast, is not unreasonable. However, it merely provides grounds for "personal opposition" to abortion and, perhaps, efforts to make people who are considering abortions pause to reflect carefully on what is, after all, a serious moral decision; it does not warrant outlawing deliberate feticide.

Dworkin argues that most people who oppose abortion do so on reasonable (i.e., detached) grounds. The problem is that many of them fail to recognize that the detached objection does not justify laws protecting the unborn against abortion. Hence, they wrongly seek to impose their view on others who reasonably interpret the intrinsic and inviolable value of life as permittingand, indeed, sometimes even requiring-abortion. If advocates of the pro-life cause would only recognize their confusion, Dworkin suggests, they could abandon the political struggle while retaining their commitment to the sanctity of life. That, it seems, is the "reasonable settlement" that Dworkin believes "all parties" can accept while retaining their self-respect. In effect, Dworkin offers the prolife movement what he takes to be honorable terms of surrender.

Anticipating a possible objection, Dworkin considers the fact that our law protects many nonhuman realities whose destruction or violation we object to on detached grounds. We protect the environment, for example, or endangered species not on the ground that they have rights but, rather, because we consider them inherently valuable. It is here that his redescription of the proabortion and proeuthanasia positions as expressing a competing "interpretation" of a shared basic commitment to the sanctity of life has its payoff: it enables Dworkin to cast the debate about abortion and euthanasia as essentially "religious" in character, that is, as a debate about "the meaning of life." Hence, according to Dworkin, the First Amendment's protection of the free exercise of religion forbids government from prohibiting what he bluntly concedes is the book's opening sentence are forms of "deliberate killing" and "choices for death" (p. 3).

of "deliberate killing" and "choices for death" (p. 3).

The success of Dworkin's argument hinges on his distinction between detached and derivative objections to these death-dealing choices and on his claim that derivative objections to the killing of unborn and seriously demented human beings are unreasonable. These, in turn, depend on the validity of the person-body dualism implicit in Dworkin's argument.

Opponents of abortion and euthanasia reject the proposition that some human bodies are "inhabited" by persons, while others, such as bodies of unborn and gravely impaired human beings, are not. They do not believe that incorporeal persons inhabit nonpersonal bodies. Thus, they view all human beings, including the unborn and the demented, as members of the community of subjects to whom duties in justice are owed—that is to say, as *persons*, or (if you will), "rights-bearers."

Dworkin's case against the view actually held by sophisticated supporters of the pro-life position strikes me as woefully inadequate. His argument that fetuses cannot have "interests" and therefore have no right not to be killed, straightforwardly begs the question; and he makes no effort to respond to the critique of personbody dualism pressed against his position by, among others, his fellow Oxford professor of legal philosophy, John Finnis.

Moreover, his talk about the contending parties in the debates over abortion and euthanasia sharing a basic commitment to the sanctity of life and only interpreting this commitment differently, is, I believe, practically insignificant. The real issue of principle between supporters of abortion and euthanasia and opponents of these forms of killing has to do with the question of who are subjects of justice.

The challenge to the orthodox liberal view of abortion

and euthanasia is to identify nonarbitrary grounds for holding that the unborn and seriously demented do not qualify as subjects of justice. Frankly, I doubt that this challenge can be met. In any event, Dworkin here fails to make much progress toward meeting it.

ROBERT P. GEORGE

A New Constitutionalism: Designing Political Institutions for a Good Society. Edited by Stephen L. Elkin and Karol Edward Soltan. Chicago: University of Chicago Press, 1993. 240p. \$45.00 cloth, \$15.95 paper.

The essayists in this collection believe "that something systematic can be said about how political institutions work and can be made to work ... and why some regimes are better than others' (p. viii). In the current intellectual climate, this seems an almost reckless statement, since postmodern analysis has quite powerfully suggested how tightly bound all political communities are to their particular and contingent rhetorical conditions. The subtitle might lead one to expect a comparative analysis of constitutional regimes rigorous enough to combat postmodernism's claim and to show that political research can escape the gravitational pull of particular cultures, find the philosopher's stone by which to show the superiority of one system's political values over another's, and thereby demonstrate the political correctness of particular constitutional designs.

There is, in fact, no serious cross-national analysis here, nor do we find a new constitutionalism through an analysis of different ways of constituting complex political regimes in general (e.g., Minnesota-Louisiana, University of Chicago-University of Georgia, IBM-Microsoft). Instead, readers will find here another critique (warranted, in my judgment) of contemporary political science. Readers will confront exhortations to abandon analyzing bits of political data, rhetorical styles, and analytic philosophy and, instead, to get on with the task of designing good national regimes.

These pages do contain many important ideas. Much postmodern thought does encourage the "hermeneutics of suspicion," and that attitude may plausibly corrode government. An ancient version of the same corroded the Roman Empire, according to Gibbon. Karol Soltan urges that designing good government means designing better citizen education to achieve greater sophistication about politics. Borrowing on Chomsky, Soltan wants the new constitutionalism to describe standards by which the ideal citizen could become an effective political speaker-hearer. Stephen Elkin draws from Kenneth Arrow the goal of designing a state that achieves the "proper aggregation of voter preferences" (p. 29). James Ceaser argues that rational choice analysis cannot respond effectively to value-laden cries for justice. Charles Anderson, restating the main themes of his book, shows pragmatism's compatibility with liberal values and goals. Theodore Lowi and Cass Sunstein deliver their familiar pitches elegantly: Lowi decries the delegation of legislative power to the executive, while Sunstein, less polemical than Lowi, points out that the founders's original hope that national government would play the role of public-spirited deliberation survives in the role played by the judiciary.

The book thus presents a theme: We must develop confidence in our capacity to define problems and their solutions through conversations that are "practical" and "conditionally normative" (p. 133). But experiencing this worthy theme-and-variations finally resembles nothing so much as the familiar pattern into which romantic relationships are said to fall. One begins with hope for something new and challenging and in due course finds oneself in the same, quite-familiar place with the same familiar comforts and the same unresolved tensions and unmet yearnings. Thus, in Edwin Haefele's concluding essay, we learn that the American republic is constituted by self-government, civic virtue, a regulated private economy, and separation of church and state.

Hence, the constitutionalism proposed here is hardly new. The authors urge us to return to the thrilling days of yesteryear, when people actually could talk confidently about designing good constitutions for good societies: it is a romantic book. In its romantic yearning for a kind of perfection, it does not convincingly demonstrate the existence of a constitutional design problem serious enough to call for major changes in the first place. In comparison with other regimes, our design does seem to have avoided police states. Our political system has not drastically limited human mobility. We are reasonably free of social-caste distinctions. The political system seems not to obstruct adapting business practices to the new global economy. Of course, public education is a mess, but the authors do not explain why we need a new constitutional design to clean that mess up

It would also have helped if the collection somewhere addressed more aggressively the assumption that academic theorizing of this sort can ever translate into major political change. Civil wars and economic depressions may redesign constitutions, and in these crisis times, great thinkers help redesign, but this book does not coincide with a crisis.

Still, two things should be said on this book's behalf. First, Justice Holmes was quite right to point out that we need reeducation in the obvious more than elucidation of the obscure. Political scientists (because they are citizens, too) do have a responsibility for seeking knowledge that may better our political conditions. Precisely because postmodernism's criticisms are on target, conventional positivist/empirical political science must take stock of its political obligations. There is no justification for what we do beyond the expectation that we will contribute to betterment of life on the planet, and the authors rightly force us to examine whether our practices do so.

Second and more important, political change requires rhetorical change. This may be the subtextual agenda of the Committee on the Political Economy of the Good Society, from which these essays flow. Unfortunately, these essays admittedly do not offer the one thing rhetorical change requires, namely, a coherent doctrine of what the new constitutionalism should look like (p. 13). But by trying—and failing—to articulate a coherent theory of constitutional design among the classical and modern theories of political economy, the book helps invigorate the postmodern hope that truly new constitutional theories are worth creating. And these theories will (as this collection implies) address how we talk.

LEIF H. CARTER

The Dialogue of Justice: Toward a Self-Reflective Society. By James S. Fishkin, New Haven: Yale University Press, 1992. 243p. \$27.50.

In *The Dialogue of Justice*, James Fishkin has produced a readable and stimulating approach to liberalism. Metalevel engagement with a range of contemporary liberal theorists leads up to a reworking and development of something close to the "dialogic" themes in Mill's *On Liberty* and an exploration of liberal society as "self-reflexive."

The book has three main parts. First, Fishkin argues that attempts at a systematic theory of the basis of a liberal political regime fail, because plausible ideas about what constitutes a just society pull irresolvably in conflicting directions. Second, he advances various plausible criteria, in light of which he criticizes other substantive viewpoints. Approaches to liberalism (1) must discriminate but not rule out everything, (2) should legitimize the state to all but not obligate citizens of other states, (3) should not provide other theories with a basis upon which to develop incompatible prescriptions, and (4) should not manipulate people's preferences. These ideas are brought alive in the critical discussion of other approaches, leading Fishkin to develop some useful typologies-for example, "brute," versus refined views of individuals' preferences, actual versus hypothetical situations, and neutrality versus universality. Fishkin's approach here is both interesting and powerful and displays the immense fruitfulness of general and metalevel argument, as contrasted with the pursuit of detailed points internal to the work of specific writers.

In the end, Fishkin finds the combination of these criteria too strong for any substantive theory. He then develops his own approach, by way of an exploration of the idea that preferences should not be coercively molded. He argues that political practices can justifiably claim support from all members of a society if (1) they are consensual in the sense of having wide support across major social cleavages, (2) are minimally voluntary (i.e., there is unimpeded exit, (3) essential benefits are supplied to all members of society, and (4) the society's practices are self-reflective, that is, subject to "continuing critical examination through unmediated debate" (p.). Fishkin develops these ideas in interesting ways, concluding with some practical suggestions about political institutions. Rather than paraphrasing his argument, which deserves to be read in detail, I shall move straight to some criticism.

First, nonmanipulation introduces more problems than Fishkin seems to allow for (see, e.g., problems raised in the community power debate and by the work of Foucault). Second, Fishkin appeals implicitly to dialogue-based ideas about epistemology. This is contentious both qua epistemology and also because it is incompatible with the implicit epistemological ideas of some of those who would be involved in his dialogue (e.g., fundamentalists). It is also not clear to what extent substantive ideas about benefits are being drawn from the epistemology as prerequisites to citizens' participation or are introduced extraneously. The latter would obviously be problematic; the former, to work, would depend on Fishkin's being able to argue that everyone can really make a potentially useful input to the argument.

Third, what one might call empowerment for the sake of participation is sometimes developed in ways that look more like the enhancement of pluralistic interest articulation, but this is by no means the same thing as dialogue. Dialogue itself introduces particular problems: it is not clear that people will be interested in listening to the arguments of others. Even today, serious discussion of political issues seems all too often to fall victim to the television remote-control zapper.

Fourth, the right of exit introduces a problem and highlights an ambiguity concerning the relation of dialogue and political community. Fishkin is working with the nation–state, but it is not clear why dialogue should generate or respect national boundaries. Why, say, should the views of those over the Mexican border (or in Australia) not count as much as those on this side? Is there a right of *entry*? Could the rich all "exit" and reconstitute their society free from the troublesome demands of the poor?

Fifth, there are also some interesting problems relating to criticism and political culture. Fishkin is himself ambiguous concerning of the position of religion at one point, arguing that it may underlie political culture (thus receiving protection but becoming subject to critical scrutiny) yet at another writing explicitly that it should be excluded from public dialogue (pp. 145, 202). (Clearly, exclusion means that in the case of conflict, what is public and subject to dialogue wins out, while religious views are treated as if they are matters of private taste; but it is not clear that believers should really want them treated in this way, not least because they will typically think that the content of their religious views is itself rationally compelling. Yet insofar as religious toleration and protection is the product of practical comprise, rather than of the principles that underlie the public sphere, this may itself mean that what is in the public sphere does not have the purely rational character that

In my view, one cannot insulate political culture from other fields; and given that political ideas will be strongly affected by other ideas (and vice versa), it is not clear that one should exclude them even if one could. All this, however, raises a more general problem concerning whether critical rationalism in the form of such openness to public scrutiny can sustain a popular political culture (see Ernest Gellner's *Postmodernism, Reason, and Religion*). Just as, in the earlier parts of Fishkin's book, one might well imagine that critical dialogue could take apart all positive ideas on the basis of which we might conduct our public lives, leaving nothing viable in their place. Or—to put it the other way round—is it not possible that the conduct of public life may require a certain measure of myth, ambiguity, and wishful thinking?

Fishkin's approach would require.)

There also seem to me possible problems with Fishkin's concern for popular and unmediated, rather than merely public, self-reflection. Some of those who, like Hayek, defend a liberal economic order as the best for mankind also argue plausibly that it has certain unavoidable defects. The problem here is that *if* Hayek is right, the connections between the defects and the advantages (and hence the limitations upon remedying prima facie defects) are not easy to explain, and it is difficult to see how they could easily be legitimated to a society's non-theoretically-minded members.

That it raises such problems seems to me an indication of the interest and fruitfulness of Fishkin's approach, rather than a point against it. The book as a whole is readable, interesting, and very thought-provoking. Are there any defects? It does have a somewhat unfinished

feel to it, and Fishkin's initial material could have done with more extensive introduction. His treatment of substantive issues could sometimes have done with a good deal more polishing; and Fishkin might usefully have returned, at the end of the volume, to discuss how his own approach related to the more general themes with which the book commenced. I suspect, however, that Fishkin will not be slow to address these and other issues that emerge from the present book, in a subsequent volume.

JEREMY SCHEARMUR

Institutional Realism: Social and Political Constraints on Rational Actors. By Robert Grafstein. New Haven: Yale University Press, 1992. 244p. \$30.00.

Robert Grafstein has made a valuable effort to confront fundamental questions about the ontological status of political institutions and their effects on political behavior. Grafstein's theory of institutional realism holds that institutions are "real things" that both limit and structure political behavior. He argues that institutions should be understood quite differently from conventions, roughly described as behavioral regularities due to common understanding. Institutions bring order and create patterns even when many people are not aware of the purposes that are being served. In short, the argument is that institutions can be treated as if they are exogenous when studying a good deal of political behavior. Institutions were not necessarily created for the purpose that they currently serve and participants may not be aware of the totality of the institution that constrains them.

Grafstein reached his position after a study of the conventional view, which is perhaps most widely known as it appears in social contract theory. In the state of nature, people recognize the dangers of anarchy and coalesce to create institutions under which they can live. He points out plenty of examples where scholars have interpreted regularized patterns of behavior (that is the way Grafstein defines institutions) as if they were conventions. For example, sociologist Talcott Parsons created an "overindividualized conception of society, one in which stable social structure must meaningfully mirror the standards and patterns of choice ascribed to individuals" (p. 43). Buchanan and Tullock are taken to task because they argue (in The Calculus of Consent) that constitutions are arrangements that are freely entered into as a refuge from the state of nature. Grafstein attacks the functionalist notions that institutions survive because they serve the desires of their participants or that institutions are a result of conscious agreements among people. Instead, "the institution in which agents are embedded establishes certain constraints on their behavior regardless of whether they are understood as such" (p. 82). The bulk of his argument against current spokespeople for rational choice theory (the "new institutionalists") is that they have not escaped the simplistic conceptions of the older conventionalism.

Two parts of Grafstein's argument are the most persuasive. First, if we rely simply on conventions, we do not have enough power to understand some institutions. We need to account for the fact that some institutions reproduce themselves without the conscious thought of their participants. Second, the conventional-

ist's tendency to interpret institutions as optimal communal adaptations should probably be abandoned. Some institutions persist despite their unpopularity. Institutions may be created and continue to exist even though the functions they serve are neither part of the intention of some of their original supporters nor of current participants. This anti-functionalist argument fits well within the current mainstream of political science thinking about institutions. Jack Knight's recent book, Institutions and Social Conflict (1992), advances the same argument. In his recent study of Congressional institutions (Information and Legislative Organization, 1991), Keith Krehbiel takes steps to avoid the functionalist tendencies in interpreting institutions, and attributes institutional design to human intention only when there is solid evidence for doing so.

Another, more dubious theme runs through Grafstein's book. He maintains that since humans are unaware of the institutions around them, our psychological models should be scaled back to reflect the limited nature of knowledge. While this claim probably does apply to some people (e.g., one-time visitors to a local school board meeting), it is hard to see how it can be consistently applied to fulltime politicians (e.g., members of the U.S. House of Representatives). Furthermore, by maintaining the argument that people are generally oblivious to institutions, Grafstein blocks himself from studying some of the really important ques-tions about institutions such as "where do institutions come from?" and "why are some institutions more able to survive challenges than others?" One is reminded of the stance taken by Edward Sait who argued that "New social forms originate and old social forms die without any clear perception, by contemporaries, of what is happening" [Political Institutions—A Preface (1938, p.15)]. Sait maintained that institutions "seem to have been erected, almost like coral reefs, without conscious design." The extremely limiting nature of this theory of institutional creation and maintenance was a major part of the inspiration for the more modern theories of institutions that Grafstein is arguing against.

Instead of developing a theory of institution-building, Grafstein explores some ideas about the effects that institutions might have when they do exist. The most thoroughly developed example of this concerns voter turnout. Rational choice scholars have wrestled with the paradox of not voting for some time, but Grafstein finds their analysis wanting. He invokes evidential decision theory to assert that because of their institutional roles, people might perceive "an unavoidable stochastic relation between their behavior and the behavior of others" (p. 102). For some reason, people believe that if they vote, then others are more likely to do so. The mathematical model indicates that a rational person, guided by evidential decision theory, might choose to participate. Empirical details on the extent to which people actually do perceive interdependencies will need to be demonstrated in future research. In addition, the role of electoral institutions in causing these interdependencies to develop (and strengthen or weaken) will need to be explored.

As is true of any book, there are passages during which one might stop to quibble with interpretations of previous research. A more sympathetic reading of the new institutionalism literature mitigates much of Grafstein's attack. Shepsle's articles, for example, contrast "structure-induced equilibria" with "equilibrium institu-

tions" in a way that accommodates most of Grafstein's criticism. Shepsle does not treat an institution simply as a "settled pattern of behavior," as Grafstein asserts (p. 85). Institutions are rules and procedures—things that exist apart from convention—that may or may not induce behavior patterns. A configuration of rules lasts (the equilibrium institution continues to exist) until a coalition forms that has the power to change it. This theory does not necessarily carry along with it the functionalist baggage of the older sociological or political conventionalism. One need not suppose that institutions are maintained by a consensus; nor is widespread agreement on the reasons for change necessary for change to occur. Institutions have distributive consequences, and when they are aware of this fact some people strive to change them and others resist.

PAUL EDWARD JOHNSON

The Interpretable Constitution. By William F. Harris II. Baltimore: Johns Hopkins University Press, 1993. 225p. \$38.50.

In the best tradition of political philosophy, Will Harris aims to make us puzzle over things taken for granted and to awaken a sense of wonder about the whole enterprise of written constitutionalism. His book often succeeds in provoking the uneasy feeling that time-honored categories of constitutional analysis are radically inadequate. This alone is a profound achievement.

Harris's ambition is no less than the founding of a new paradigm of constitutional studies, one that would leave behind what he regards as the stale dualisms of standard approaches: strict versus loose constructionism, activism versus restraint, substance versus procedure, interpretivism versus noninterpretivism, and positivism versus natural law (pp. 124–31). These unhelpful dichotomies would be case aside to accommodate Harris's complex "theoretics of thirdness" (p. 29).

Harris's third way is not easily described. It is non-foundational in that it eschews reliance on "external" sources of meaning and authority, including natural law, philosophical theories of justice, and the intentions of the framers where these are not discernible in the Constitution itself. In terms strikingly reminiscent of John Rawls's *Political Liberalism* (1993), Harris argues, "Whatever may be the ultimate 'truth' of the constitutional model from the external perspective, I am not concerned about it. . . . 'Truth' is an inapposite category in political theory" (p. 14).

Harris would have us reconceive the whole genre of constitutionalism as a self-contained practice, "justified not in terms of some higher or firmer independent ground, but owing to its internal sure-fittingness" (p. 11). Written constitutionalism's ambition is, for Harris, comparable to that of Hobbes's sovereign—to ward off chaos by regulating language and reconstituting our lives deeply and pervasively. In the beginning, the sovereign people "speak the Constitution," thereby channeling, bounding, and defining political power and calling themselves into being as a constitutional people. The challenge of the constitutional interpreter is to preserve the existence of this people by moving back and forth between the written document and the con-

stituted political order, interpreting the one in light of the other.

The two orders of constitutional word and policy (or Constitution and constitution) are related not simply analogically but "homologically," as mutually constitutive parallel structures (pp. 90–91). The absence of any external grounding "brings on the need to make the internal enterprise very solid" (p. 11). Political wholeness, order, and legitimacy rest on nothing more than "the continual process in which the words of the document and the activity of the polity are aligned" (p. 13). But not any sort of alignment will do. The original sovereignty of the people lies not in their collective willfulness but in the fact that they will reasonably and as a whole. Interpreters should reconfirm these elevated qualities by striving to render political power comprehensible and reasonable.

Harris rightly disparages the view (so dear to the law schools) that constitutional interpretation is the special preserve of a professional elite. Authority resides not simply in an original act of ratification embedded in the past but in the continual ratification of conscientious interpreters living under the Constitution's authority. Thus, the Constitution's authority depends on its "legibility" and "interpretability"—meaning that we should strive for a politics in which public officials and citizens take their roles as conscientious interpreters seriously, giving and demanding constitutional reasons in public and insisting on real coherence between interpreted document and political practice.

If Harris owes a debt to Hobbes, he clearly owes one to the ancients, as well: he strives to recover the ancient insight that the political regime pervasively constitutes the character of citizens. Harris's constitution is not merely a form of political power but a "regime," or way of life. The terms and categories of a successful constitution become second nature, providing the political language and self-image of the people as a whole.

Harris casts new light on many constitutional issues. He provides, for example, a useful if sketchy account of popular sovereignty, a conception of which he finds adumbrated in the Constitution's provisions for its own ratification. By identifying a notion of sovereign people implicit in the Constitution, Harris makes it clear that the Constitution conceives of (and indeed derives from) a form of authority higher than those required to amend the Constitution. This has the effect of putting the amending power in its place, contained within, and limited by, the Constitution in various ways. Indeed, Harris interestingly argues that popular sovereignty provides a standard for ranking the authoritativeness of Article V's different modes of proposing and ratifying amendments (by legislature and popular convention).

There is much to admire in *The Interpretable Constitution*, but many will be put off by the book's frustrating elusiveness. Much of this is due, no doubt, to the intrinsic complexity of the argument. Yet Harris asserts at one point that clarity "is a controversial virtue. . . . It has a political program. Its technique is to naturalize its assumptions, to make them seem neutral, transparent, inarguable" (p. 37). Harris means to warn us, I believe, that the demand for clarity may discourage the deployment of difficult abstractions even when they are required by the subject matter. This is a fair point, I suppose, but an author bears the burden of showing that difficult prose is necessary. Some will doubt that Harris has met the burden.

One genuinely interesting feature of this book is that

Harris attempts to combine a moral seriousness akin to Sotirios Barber's (*The Constitution of Judicial Power*, 1993) with a resolute dismissal of moral foundations. The constitutional interpreter seeks, says Harris, reasonableness, coherence, viability, and wholeness but no grounding in external standards or universal moral principles. Harris's Constitution is a constructed and self-contained order—a "public system of signs sheltering a widely available lucidity about public matters," a "stipulated public universe" grounded in nothing but its interpretability (pp. 12, 14, 102). A community of conscientious interpreters, Harris asserts, is self-sustaining and in need of no foundational account of the nature of moral reality.

Harris thus appears to join Rawls in claiming that one can put aside foundational questions without embracing the sort of moral flipness found in much of Richard Rorty's work. Despite their similarities, the postures of Harris and Rawls also seem decidedly at odds. (It is too bad that Harris never engages with Rawls's current project). Rawls would have us put aside foundational issues subject to reasonable disagreement without asserting the truth of a particular reasonable view (the range of reasonable foundational views being limited). Rawls does not deny that there is a "true" account of the trust as a whole, he only asserts that reasonable people can disagree (within a certain range) about what the truth might be.

Harris's constitutionalism, on the other hand, sometimes appears to rest on a very definite and particular foundational view-a morally skeptical conventionalism. Harris relies, after all, upon a distinctively Hobbesian rendering of the problem of political order. Hobbes emphasized the radical nature of prepolitical disorder in order to justify political absolutism. Harris also views constitutions as hedges against primal chaos and "the nothingness of disorder and darkness" (p. 49; see also pp. 51, 73, 107, 174, 176). Harris is not out to justify absolutism; rather, he deploys the trope of the darkness and chaos outside the constitution's bounds to emphasize the absence of any external grounding for constitutional meaning. All this also serves to dramatize the Constitution's radically constitutive consequences for social life and citizen character.

It is odd, however, to portray the Constitution as independent of a variety of preexisting sources of order and meaning: the British constitutional tradition, shared beliefs about natural rights, the family, economic markets, the state constitutions, and the English language. Even the Declaration of Independence is completely missing from Harris's account. Harris's point seems to be that none of these sources provides an external standard for settling constitutional meaning, any more than do natural law or the unwritten intentions of the framers. To posit such an external source of meaning would make a mockery of the form of words that were solemnly ratified, that claim to be supreme law, and that we take (or should take) so much pains to interpret; it would deny the fundamentality of this form of words. Talk of darkness and chaos beyond the constitution's well-lit space may not, then, be intended to disparage the importance of history, rights theory, and other matters. It may only imply that all claims to constitutional meaning must be cashed out from within the (at least somewhat) autonomous enterprise of constitutional interpretation.

Harris is acutely aware that the success of the Consti-

tution depends upon its ability to fundamentally reconstitute the polity as a whole in its own image. The radicalism of Harris's constitutionalism is a useful corrective to the bland superficiality of the dominant legalistic models and some liberal theory. Even so, it is far from clear that the need for such a corrective justifies Harris's claim (recurring and melodramatic) that only void and darkness lie beyond the Constitution's orderly and well-lit space. The Constitution constitutes radically—transforming families, churches, and even language in its own image—but it does not create order out of sheer chaos. The Constitution constitutes, but only to a degree. If Harris's view were to take hold, his own corrective would need correcting.

The Constitution is one of our shared practices, but not the only one. Philosophy, history, comparative politics, and other disciplines allow us to imagine alternative constitutions and to keep some critical distance on our own. The very radicalism of Harris's constitutionalism puts that distance in jeopardy. That radicalism and its implicit flirtation with nihilism also jeopardize the faith in public reason that elevates Harris's conception of political authority above mere willfulness.

Perhaps, however, Harris's point is that within a successful constitutional order such as ours, real critical distance is far more difficult to achieve than is usually imagined. The Constitution constructs its ideal readers as its citizens. One might always suspect, therefore, that claims to critical distance are a conceit—that the only standpoints available are hopelessly in thrall to the deep practices and presuppositions of the regime that simply make us what we are. Such reflections can indeed lead one to entertain nihilistic possibilities, and here, again, Harris has a disquieting point.

Harvard University

STEPHEN MACEDO

Algernon Sidney and the Republican Heritage in England and America. By Alan Craig Houston. Princeton: Princeton University Press, 1991. 335p. \$39.50.

Algernon Sidney was executed in 1683. He was suspected of plotting to assassinate Charles II, king of England, and his brother James, Duke of York, the future James II. In the absence of the two witnesses required by the English law of treason, the court allowed an unpublished theoretical treatise, the *Discourses Concerning Government*, to be admitted as evidence against him. When the *Discourses* were published in 1698, edited by the pantheist and freethinker John Toland, they established Sidney's enduring reputation as a martyr for liberty. Throughout the eighteenth century Americans referred to Sidney and Locke as the two great theorists of political rights, and it is possible that Sidney was more influential than Locke.

There are two reasons now for turning to Sidney's *Discourses*. First, Sidney was one of three authors to write a book-length refutation of James Filmer's defense of absolute monarchy, *Patriarcha*, shortly after it was published in 1680. The other two were James Tyrrell and John Locke, and the similarities, differences, and possible relations of influence between the three works are matters of continuing debate.

Second, Sidney (who fought for Parliament in the Civil War and spent years in exile after the Restoration) was widely regarded as an obdurate republican. Ever since the publication of John Pocock's Machiavellian Moment (1975) scholars have been studying the links between seventeenth-century English republicanism and the American Revolution, and debating the claim made by Pocock, Gordon S. Wood, and others, that John Locke, liberalism, and the natural law tradition of argument were relatively insignificant in the making of a revolutionary consciousness, while a contrasting republican tradition, concerned with virtue, corruption, and citizenship, rather than rights and obligations, was all-important.

Modern Sidney scholarship may be said to begin in 1978, when Blair Worden announced the discovery of the Court Maxims, a previously unknown (and still unpublished) political treatise by Sidney, apparently written in 1666. Since then, four volumes, apart from Houston's, have been devoted to Sidney: Paulette Carrive (1989); John Carswell (1989); and Jonathan Scott (1988 and 1991). Of these authors Houston is undoubtedly the best. He is learned and accurate; moreover he writes well, and argues clearly. (Some of the best arguments and liveliest quotations are concealed, in the manner of Gibbon, in the footnotes.) As a thesis this study received the Leo Strauss Award, and the book has gone on to win the Foundations of Political Theory Book Award.

Houston begins by providing an admirable summary of what is known of Sidney's life and political activities, and a sketch of the royalist theories he opposed. It is particularly helpful to have an explanation of why some scholars have argued that Filmer's views were typical of Tory thinking, while others have insisted they were exceptional. At the heart of the book stand three chapters on the political theory of the *Discourses*. These stress that Sidney believed in popular sovereignty and the separation of powers, not in "mixed government" as that term is usually understood. They are followed by an important final chapter on Sidney's influence in America.

The book's central argument is a simple one: Sidney writes in the natural law tradition of Grotius as much as he does in any republican tradition. Eighteenth-century readers usually coupled Locke and Sidney together, and felt under no obligation to choose between them. Scholars who follow Pocock and Wood in contrasting republicanism to natural rights theory obscure the presumption of contemporaries that the two complemented each other. (A similar argument has been made with regard to Cato's Letters by Ronald Hamowy).

On this question I find Houston entirely convincing. I am not persuaded, though, by his further claim that Machiavelli was not an important influence on Sidney (pp. 164-5, and other places listed in the admirable index.) I find it hard to read Sidney on the need to foster a warlike people (2.15, 2.21, 2.22, 2.23: "That is the best government which best prepares for war") or on civil disorders (2.24) without sensing the influence of Machiavelli. When, for example, Sidney defends "extrajudicial proceedings" and "extraordinary ways" I suspect he is translating Machiavelli's modi straordinari. It is true that there are numerous Machiavellian themes which do not interest Sidney (p. 165), but it is not true that for Machiavelli corruption and change are synonymous (p. 218): when Sidney criticizes those who think they are it is presumably Harrington, not Machiavelli, he has in mind.

If Houston underestimates Machiavelli's influence, he

is right to insist that republicanism and Machiavellism should not be treated as synonymous, and that Machiavellism should be regarded as a range of preoccupations, not a single theory. He correctly notes that Sidney's favorite author is not Machiavelli but Tacitus (p. 154). Of course seventeenth-century readers often turned to Tacitus to find there the arguments of Machiavelli, an approach which had been particularly encouraged by Traiano Boccalini, whom Sidney twice cites with approval (2.21, 2.30). But, like Sidney, Boccalini was interested only in a few specific aspects of Machiavelli's thought. It would have been interesting to compare Sidney with Boccalini, for both played a crucial role in adapting the republican thought of the Renaissance to make it serviceable in nation rather than city states. Such a comparison might have provided the basis for an alternative account of the republican tradition to that proposed by Pocock.

It is a sign of a good book that one wishes the author had written more not less. Houston describes the argument of Sidney's *Discourses* as "a sunken ship: though a few promontories are visible above the surface, the great hulk remains submerged in the depths" (p. 180). He has done an admirable job of salvaging what can be recovered from the wreck, and is persuasive in his claim that its design was less antique than has previously been believed. Sidney died so that his beliefs might live: thanks to Houston we now have a better understanding of what those beliefs were.

DAVID WOOTON

Justice between Age Groups and Generations. Edited by Peter Laslett and James S. Fishkin. New Haven: Yale University Press, 1992. 243p. \$30.00.

Choice over Time. Edited by George Lowenstein and Jon Elster. New York: Russell Sage Foundation, 1992. 352p. \$39.95.

The issues of maintaining the quality of the ecosphere, the sustaining of the modern welfare state, and the restructuring of our national debt are each of immediate interest and of concern for those who examine intergenerational equity issues. More generally, those who look at intergenerational issues must concern themselves with how humans make decisions regarding outcomes that occur in future time periods. Similarly, those who must analyze how we choose from among alternatives with payoffs in the future will want to consider applications that go beyond one person's lifetime (i.e., intergenerational problems).

The Laslett and Fishkin volume is a collection of 11 essays that can serve as a serious introduction to some of the philosophical issues regarding intergenerational justice. The Lowenstein and Elster volume explores some of the experimental and other empirical findings and technical theoretical issues involved in explaining choice behavior involving delays and time. Although both books are of considerable depth and quality, neither really integrates the two concerns of intergenerational choices and choice with a time dimension. Thus, the student of either subject may wish to look at the two together for a rounded grasp of the subject. The pair of essays that Tyler Cowen helped author in the Laslett and Fishkin volume, analyzing the issues surrounding

the discounting of future payoffs in choice, comes closest to dealing with both issues at the same time.

But the lack of integration of the subjects of the two should not be taken as a harsh criticism of either. The Laslett and Fishkin volume contains a number of very interesting essays for those of us concerned with public policy or intergenerational equity. Although many may be aware of the longer history of welfare policies in the West, the historically oriented essay by David Thomson, "Generations, Justice, and the Future of Collective Action" is still worthwhile to jog our memories. Thomson summarizes some of his other research to show that the current insurance type of welfare state is historically not likely to be considered stable. Large transfer programs of the sort currently offered in our modern welfare state also were around in the nineteenth century and earlier. They all went through cycles of lack of popular support. Thomson then argues that such instability threatens the insurance value of the state programs and hence their value in the eyes of the citizens. He also makes the somewhat more controversial and original argument that these social (or entitlement) programs really are a redistribution to a particular generation. All in all, this is a controversial and enlightening piece.

Most of the other papers are substantially more philosophical in nature, and some of these are very strong indeed. Especially helpful were the pieces by George Sher ("Ancient Wrongs and Modern Rights") and James Fishkin ("The Limits of Intergenerational Justice"). Sher's piece is a very useful extension of Nozick's argument regarding compensation over time. Sher investigates the conditions under which the justification for compensation decreases as the event is further in the past, and he does this in a highly sophisticated and interesting fashion, dealing with such issues as the cross-generational consequences of behavior.

Fishkin, on the other hand, indicates how we might have to consider new foundational concerns if we wish to extend ethics across intergenerational issues. For example, traditional theories of harm and torts maintain individual identities as specific arguments in the welfare arguments (e.g., if you do X, it would hurt that particular person, i, and thus you should offer to i compensation). Fishkin shows that these sorts of argument are problematic for many (if not most) intergenerational equity issues. Juxtaposing this class of theories with "individual-identity-independent" theories of ethics, he shows that the theorist has no strong options. Fishkin then sketches how some of his earlier published ideas can be extended to perhaps give us some leverage in these situations.

Some of the other pieces (e.g. those by Braybrooke and Epstein, and the introduction were a bit less interesting. Braybrooke and Epstein restate quite classical and opposing ideological positions that are not really worth reviewing. And Laslett and Fishkin's introduction was less a guide to the skeletal structure of the volume than it might have been.

As indicated, the two pieces by Cowen can be seen to serve as a bridge between the two books, especially "Consequentialism Implies a Zero Rate of Intergenerational Discount." This essay is in the style of social choice proofs and includes a demonstration that (1) Pareto indifference, (2) transitivity of indifference, (3) neutrality (between persons within generations), and (4) well-defined preferences across living in different eras imply that one have no discounting of future states. Although

there were some problems with the analysis, the argument was valid and interesting. Validity, of course, does not imply soundness; and among my objections to the soundness of his claims, I would include his assertion that the four conditions are equivalent to consequentialism, that is, are needed to evaluate the qualities of an outcome (e.g., in cost-benefit terms). Also, Cowen does not properly deal with some of the difficulties in the four conditions. For example, the axiom of Pareto indifference has numerous limitations, which are not properly fleshed out. Indeed, its problems are similar here to its problems in the case of noncomparative utilities in Sen's proof that we cannot make judgements about redistribution. But the chapter is still a very interesting point of departure.

Choice over Time is concerned with individual choice when payoffs associated with alternatives are best understood as varying in their time of receipt. The concerns addressed here are primarily those of the modeler and theoretician in the psychology, economics, and public choice traditions. Within this book, one finds considerable information about the problems, findings, and theories of individual choice with delayed payoffs. The difficulties and models outlined by the authors here are quite analogous to the conundrums and anomalies developed by Kahneman, Tversky, Grether, and others in the areas of choice under risk. The researchers interested in prospect theory and other such models will find this volume quite enlightening. The very useful introductory essay weaves a demanding collection of essays into a manageable intellectual tapestry. The utility of the introduction is greatly enhanced by a second essay by Lowenstein, giving a sketch of the intellectual history of this field. But getting into the remainder of the volume in depth is a daunting affair, unless one has previously invested heavily in this area. In too many of the essays, the technical terms are not defined, and the models are not carefully explicated for the new comer. This failed task leaves the volume of serious interest almost exclusively to those who are already literate in research in the area of time-discounted choice. The essays contain reports and critiques of virtually all the important experiments. The major controversies and models are aired and even, in some places, extended.

The foundational conceptualization of choice concerning delays serves as a solid foundation for a number of alternative conceptualizations of the problem, including concerns with the shape and contents of the discounts. Essays by Mischel, Shoda, and Rodriguez; Ainslie and Haslam; Rachlin and Raineri; and Lowenstein and Prelec investigate these alternative foundations. They further lead to a common theme, or unity of perspective, that persuasively paints the area's major anomalies (e.g., predictable patterns of preference reversals over time as generalizable models of discounted choice over time. Indeed, this is done with considerable panache and intellectual sweep. Ainslie and Haslam, for example, move from the problems of general personality instability (e.g., as manifested in extreme cases via multiple personalities) to more ubiquitous preference instabilities.

Even though some of the findings are often found more compellingly developed elsewhere, this collection shines as a serious dialogue over the issues and extensions that are at its heart. For example, the essay by Schelling on self-control is an echo of his pieces in the American Economics Review and Public Interest. But here we find Shelling's argument "formalized" and placed in

a tradition of hyperbolic discount functions in a second essay by Ainslie and Haslam. This generalization enables us to see the general problem of addiction and disfunctionality (as well as self-control) as special problems in the area of discounted choice. As a general problem, self-control is further developed in three other essays by Shefrin and Thaler; Becker, Grossman, and Murphy; and Herrnstein and Prelec. With such juxtapositions and selections, Elster and Lowenstein have put together quite an intriguing volume.

In sum, those nonneophytes interested in micro issues of choice involving payoffs through time will find the book of value. And those interested in the macro policy concerns of the subject (e.g., as dealt with in the Laslett and Fishkin volume) should find the theoretical and empirical contents of the book of considerable use in their positive analysis of the choices over the policy alternatives.

JOE OPPENHEIMER

The Social Cage: Human Nature and the Evolution of Society. By Alexandra Maryanski and Jonathan H. Turner. Stanford: Stanford University Press, 1992. 213p. \$39.50 cloth, \$12.95 paper.

Unlike the vast majority of theory works in social science, Maryanski and Turner embrace natural science as a relevant source of theory, data, and methods that social scientists can employ the better to understand human social behavior. In particular, this book deems evolutionary theory and primatology to be indispensable to realistic analysis of the social biological adaptation of contemporary human societies. The Social Cage is authored by sociologist biosocial-theorists. It was evidently written for sociologists, but it is certainly readable by political scientists. Members of the APSA's politics and life sciences section agree with Maryanski and Turner about extending historical time by using evolutionary theory in a serious way; insisting upon conceptualizing humans and primates, whose big brains are responsible for their unique cultural constructions; and insisting also upon transcending the usual social science cultural determinism by substituting a transactional biosocial approach to any study of human social organization, communication, and behavior generally. There are, of course, hundreds of such works by physical anthropologists, as exemplified by Adrienne Zihlman's The Human Evolution Coloring Book (1982).

Maryanski and Turner's discussion of human animality is exceedingly brief and relies much more than necessary on pop ethology, instead of the standard works by zoologists who teach and do research in the field of animal behavior. The authors' selection of sources for, and coverage of, primate systematics is much better done, both qualitatively and quantitatively. However, they do represent the organizational (and even more important, the aggressive) behavior of common chimpanzees by giving major credence to the later, rather than the earlier, work of Jane Goodall. Of course, the earliest work from 1960 to 1963 was done by Jane herself, observing the Gombe chimpanzees in a relatively much more natural setting than later with dozens of collaborators, after the human political, economic, and social environment caged her research enclave in. Anthropologist Margaret Power has pointed out that Maryanski and Turner "do rely wholly on reported behaviour of the Gome (and Mahali) studies of abnormally stressed chimpanzees, in drawing up Table 1. This results in a picture of the natural behaviour of chimps generally which is the opposite to what they would have found, had they drawn on the naturalistic studies of undisturbed (not artificially fed) apes. The result is that they propose an extremely misleading understanding of the probable behavior and relationships of our hominid ancestors" (personal communication). Moreover, as nonexperts in the subject they summarize, they give the impression of being perhaps overly impressed with such methodological innovations as cladistics and its imputed power to determine what pre-World War II paleoanthropologists called the "Missing link," which Maryanski and Turner denote as the last common ancestor among humans and other great apes. On the other hand, their detailed cross-species analysis of the species-specific social network characteristics among both hominoids and Old World monkeys, proffers a provocative approach for generalizing about the social organization differences among and between apes and monkeys.

They take quite a bullish stance on the question of the language/mental abilities of chimpanzees and gorillas, which they manage to do at least in part by overlooking such skeptical works as Thomas Sebeok and Jean Umiker-Sebeok's Speaking of Apes (1980). Much better is their discussion of psychobiology in relation to the transactional development of brain size and language among hominids over the last four million years and especially the last million years, together with a good summary of the complex relationships between primate/ human perceptive sensory organs and cognitive phylogenetic development. Then they relate sensation-cognition-language to hominid/human behavior—in response to ecological changes through evolutionary time—as determinants of the social communication basis for hominid social organization and behavior. That, in turn, resulted in the extraordinarily stable forager, gatherer, and hunter niche that characterized Homo erectus, Archaic homo sapiens, Homo sapiens Neanderthalis, and Homo sapiens sapiens for 1.5 million years, in contrast to the maladaptations of the past 12 thousand years (i.e., less than 1% of the gathering-hunting base time).

Maryanski and Turner assert that when the huntinggathering niche was universal (initially, in Africa then later through the Middle East to Europe in the West and Asia in the East), humans all lived in a correspondingly universal Garden of Eden—as compared to the niches that followed during and after the transitions to herding, gardening, agriculture, industrialism, and postindustrialism. In this regard, it is evident Maryanski and Turner, in their discussion of preindustrial societies (chaps 4–5) follow closely the theory and terminology advanced in the sixth edition of a more than 20-year-old leading text in biosocial sociology, which anticipates the same argument about the relative similarity of industrial societies to gathering and hunting groups, in regard to the putative isomorphism between the evolved species genome and the benefits of the adaptation in terms of such positive values as egalitarianism, leisure, freedom, and so on (Lenski, Lenski, and Nolan's Human Societies [1991], 403-37). Also, includes in his earlier introductory text in general sociology a briefer but theoretically identical statement of the present discussion of preindustrial and industrial societies, except for a less extensive development of social organization network theory (Sociology, 1985. chap. 4).

Gathering and hunting was an Eden because population sizes and levels remained sufficiently low that adequate food (both plant and animal) could be acquired with relatively little time and effort by small groups of humans who moved about opportunistically, continuously resettling their habitat. No one could amass material wealth; leadership was multiple-role-oriented; males and females were deemed to be equally important; and the group was also egalitarian in its economics, society, and politics. This, in turn, promoted a high degree of individualism. Over the period of 1.5 million years, the human species genome was shaped by selection for phenotypes that could behave in ways appropriate to the gathering-and-hunting niche; and that adaptation become genetically fixed by perhaps a hundred thousand years ago, by which time both brain size (weight) and language capacity had stabilized. (This interpretation of human phylogenetic development is quite conventional among paleoanthropologists and paleo-human biologists. It may be novelty for most political scientists but not, of course, sociologists.)

The social cage consists of the increasing constraints on human individual and social freedom imposed by the categorical imperatives of humans' adapting to "civilized" life as the caretakers of domesticated plants and animals (as Maryanski and Turner explicate in great detail in their chapters on horticultural and agrarian societies). Indeed, by the time one reaches their concluding chapter, cage becomes a much-overworked metaphor for human self-domestication.

An especially novel—and to me perplexing—section occupies the latter part of chapter 7 (on industrialized societies) and chapter 8. Thus, "industrial societies . . . [are] far better than their predecessors because of their capacity to free people from much physical drudgery and to give them wide arrays of options and opportunities and much more say in how they run their lives" (p. 140); yet they also assert that "kinship in industrial and post-industrial systems completes its odyssey back to its original nuclear profile in hunting and gathering societies" (p. 157). They had previously characterized kinship in hunting and gathering societies as involving "neolo-cal, bilocal, and patrilocal" residence and a "clear division of labor; males hunt, and females gather and do domestic chores" (p. 86) which seems difficult to reconcile with contemporary yuppie family life in postindustrial societies. Margaret Power has emphasized that the impact of kinship throughout human evolution has been to establish bonding, not caging; and she shows that the patrilocal band model, as distinguished from the forager model that characterized human organization throughout the initial 99% of human organization throughout the initial 99% of human existence, reflects pre-1960s anthropology (The Egalitarians-Human and Chimpanzee,

Maryanski and Turner further state that "the state is transformed with industrialization, becoming much more democratic and larger" (p. 157). Again, "The changes associated with post-industrial systems are more compatible with humans' biological nature than those occurring in earlier ones" (p. 161). Again "[Postindustrialism is] a system comparatively well attuned to [humans'] ape ancestry . . . [and] in truth ordinary people embrace the chance to live and participate in a system relatively well attuned to their primate heritage" (p. 162). In other words,

industrial society, technology, postindustrialism, and our contemporary nuclear-computer economy and society have "liberated" humans from their agrarian bondage, so that individualism is on the rise again; and, through the blessings of industrialism and technology (as exemplified by electronic kitchens that free their possessors to see professional employment meet to their high education and skills), they are living more like their gathererand-hunter forebears than any of their immediate foremothers-and-fathers could do during the 10 thousand years or so preceding the nineteenth century in England, Europe, and North America.

I have no doubts that industry and technology have given Jane Fonda and Ted Turner a relatively greater freedom that the average gardener or farmer-or even gatherer-hunters might once have enjoyed. Maryanski and Turner might be more persuasive if they attempted to demonstrate empirically that most people in modern industrial/postindustrial societies are upper-middleclass or better and are politically equal in fact and that they enjoy the leisure of a four-hour (i.e., a gathererhunter) working day. But the facts are that yuppies and libertarians and Perotistas are a small minority even in such great capitalistic societies as the United States and Japan and few of them are on four-hour workdays. I do assert-and on empirical grounds-that the social cage of postmodernist postindustrial technological life is the opposite, in its effects, to what Maryanski and Turner claim and hence that their concluding two chapters have got it backward. The social cage today is exponentially worse than that of agrarianism with regard to the economic security and the political and social freedoms that for most people make their lives worth living.

Nevertheless, and irrespective of my caveat on the empirical question whether contemporary humans are now occupying a niche that resembles that of gatheringand-hunting peoples, this book will be informative and enlightening to the many political scientists who attempt to teach and research politics while at the same time ignoring evolutionary theory, human evolution, and the biosocial aspects of human social organization and political behavior. I recommend The Social Cage to political scientists as a novel, intriguing, and exciting approach to understanding the relevance and importance of a great deal of "non-social science," that is, biosocial research findings relating to human communication, social organization, and political behavior today. Political behavior has been a reality since Homo sapiens began some 50 thousand years ago and, to some extent, even before then in the social life of our hominid and, earlier, hominoid forebears.

University of Hawaii, Manoa

GLENDON SCHUBERT

Foundations of Liberalism. By Margaret Moore. New York: Oxford University Press, 1993. 222p. \$45.00.

This is a very good book. Margaret Moore critically discusses, with admirable clarity and fairness, the work of a number of leading contemporary liberal thinkers, including Gewirth, Rawls, Gauthier, Larmore, Kymlicka, and Raz. Informed by a sympathetic appreciation of contemporary communitarian thought, her judgments regarding liberal theory, though often critical are not marred by the strident, polemical tone too often found in similar exercises. The analysis is detailed and

careful, with far more insights generated than axes ground. Along with Will Kymlicka's Contemporary Political Philosophy (1990), this book provides one with a sound and sophisticated overview of the "main positions" staked out in contemporary liberal theory. But it will also be of interest and benefit to those already familiar with these theorists and their critics. I have read a great deal of material dealing with liberalism and communitarianism over the past five years, and this ranks with the best.

The analysis is organized around the contrast between the personal point of view and that of the impersonal or impartial perspective of morality. The various liberal theories are evaluated in terms of the facility (or lack thereof) with which they articulate a compelling solution to the "integrity problem" (explaining how the personal and impartial perspectives are related) and the "motivation problem" (explaining why the person has reasons to act in accordance with the demands of impartial morality). In part 1, Moore applies this analytical framework to the theories of Gewirth, Gauthier, and the Rawls of A Theory of Justice, treating each as an attempt to resolve these problems. While seeing somewhat less merit in Gauthier's version of instrumental morality than Moore does, I nevertheless found her treatment of all three to be enlightening. My guess is that of the thinkers treated in the book, Gewirth's views are the least well known to political scientists; Moore's chapter on him will serve as an excellent introduction and critical overview. The chapter on Rawls is also quite good. I was especially intrigued by Moore's comments on the relationship between the structure of the family as an institution and the development of moral sentiments; they make for an interesting comparison with those of Susan Okin expressed in Justice, Gender, and the Family

In part 2, Moore considers contextual (Larmore, the later Rawls) and perfectionist (Raz, Kymlicka) arguments for liberalism. Moore's evaluative stance toward these views is somewhat more equivocal than the straightforwardly negative conclusions advanced in regard to the theories treated in part 1. This is because the views treated here (especially those of the later Rawls and Raz) are in important respects, similar to the views Moore herself advances in part 3 as an "alternative foundation for political and ethical principles." Moore acknowledges these similarities openly, while nevertheless rejecting the theories of (the later) Rawls and Raz in their present formulations. This difficult balancing act is well executed, and the resulting discussion of possible strategies of articulating and defending liberal principles (or political principles generally) will be thought-provoking and illuminating to anyone concerned with such

The similarities are, roughly, as follows. Moore's alternative foundational views include (1) a conception of the person that accepts the notion of a constitutive tie between personal identity and the social relations characteristic of a particular community; (2) a conception of justification (of ethical and political principles) sufficiently modes, local, and historically bounded not to aspire to universal or timeless validity; and (3) an affirmation of the perfectionist view that the state can be "justified in acting to protect and promote valuable ways of life. State action in support of certain ways of life may be necessary to ensure a flourishing and valuable culture, in which meaningful choice is possible" (p. 193). Rawls now

seems to endorse view 2 and arguably view 1, while Raz endorses views 1 and 3 and arguably view 2. Moore nevertheless criticizes Rawls and Raz on the grounds that the liberal political principles each endorses are ultimately inconsistent with these foundational philosophical claims.

There is, in my view, a good deal to be said for versions of all three views and hence for the foundational views that Moore skillfully defends in part 3. I was not as convinced by her arguments in support of the claim that liberal political principles are, of necessity, in a contradictory relation to these foundational viewswhich is another way of saying that I think Rawls' and Raz's liberalisms more defensible than does Moore. Readers will have to judge this and much else for themselves, of course, but they may be assured that reading Moore's book will provide much stimulation toward doing so and a fine example of how to do so thoughtfully.

University of Vermont

PATRICK NEAL

On the Edge of Anarchy: Locke, Consent, and the Limits of Society. By A. John Simmons. Princeton: Princeton University Press, 1993. 293p. \$39.50.

In this work, the author seeks "to present, analyze, and to a certain extent defend . . . John Locke's own theory in his Two Treatises of Government." In addition, On the Edge of Anarchy tries to present "the best possible defense" of Locke's political philosophy, although this may involve "excising or dramatically revising" Locke's thought, as well as subjecting it to "a contemporary critique" (pp. 3, 7). What we are promised, then, is that "the new Lockean view that will emerge at the end of this work is a better, clearer, more helpful view than Locke's own" (p. 9). This approach was adopted by Simmons in The Lockean Theory of Rights, and, as a comparative assessment, it has to be said that the objectives of Simmons's methodology were much more successfully realized in the earlier work. Whereas it was concerned only with Locke's theory of rights and not his whole political philosophy, the present book reverses this emphasis. One of its defects lies in Simmons's truncated version of what constitutes the "whole" of Locke's political theory.

On the Edge of Anarchy is structured around a discussion of Locke's account of the state of nature, his theory of consent, and his theory of resistance-important elements of Locke's political thought, to be sure. While these elements are considered in relation to each other, much of what gives meaning to "Locke's own theory" is omitted from the discussion altogether. This is because whereas Locke's meaning is often embedded in the political conflicts of seventeenth-century England, Simmons's meaning is often derived from contemporary

philosophical definitions.

For example, in discussing Locke's definition of the state of nature as a condition lacking "a common judge with authority," Simmons argues that Locke cannot really mean that want of a common judge is a definitional feature of the state of nature. This argument is premised upon a rather sharp distinction between a 'judge" and a lawmaking body, so that (Simmons concludes) a "common judge would appear to lack the right to make law for those he judges between"

(pp. 18-19). But this enforces a modern distinction that Locke and his readers would not have felt compelled to make, since they regarded Parliament as both a lawmaking and a judicial body. So when Locke writes that what "puts men out of a state of nature into that of a commonwealth, by setting up a judge on Earth with authority to determine all the controversies, and redress the injuries, that may happen to any member of the commonwealth; which judge is the Legislative, or magistrates appointed by it," it is clear that for him, the 'judge" and the lawmaking body are the same (Second Treatise 89). Moreover, this perspective is part of another argument that Locke is making here, namely, that no one could "think themselves in civil society, till the Legislature was placed in collective bodies of men, call them Senate, Parliament, or what you please"; and this civil society, with the legislature as the common judge with authority, is again contrasted with the state of nature by mutually exclusive definitions (ibid. 94). What is obscured in Simmons's discussion is the political importance of this argument against absolute monarchy, which (as Locke defines it) is simply the combining of executive and legislative power in the hands of a single individual (ibid. 91). Locke's conception of a limited monarchy in terms of institutional limitations (i.e., a division of executive and legislative power) is thus important for his defense of "civil society" as a particular kind of institutional arrangement or distribution of political power, contrary to Simmons's reading of the text, which seems to imagine that Locke has an interest in defending a notion of "limited monarchy" as a legiti-mate form of government apart from the institutional division of powers just described above (ibid.).

In discussing natural rights, Simmons argues that there is "a distinct lack of evidence" that Locke "took himself to be defending a thesis of inalienable rights" (p. 119). Much of this discussion is concerned with arguing that since we do not possess certain rights (e.g., the right to consent to kill ourselves), we cannot alienate what we do not have (pp. 120-21). Armed with this philosophical pronouncement, we may then dismiss virtually all of the Lockean candidates for inalienable rights, including the right to religious toleration (pp. 108-46). This seems an example of the kind of word manipulation that frequently passes for philosophizing. If I am entrusted (by God and natural law) with a right to choose my religious beliefs and, Locke argues, this right can neither be delegated to another nor taken away from me by another, this right to choose would normally be understood by individuals living in the seventeenth century as an inalienable right. Moreover, as part of a political debate, the claim for an inalienable right plays an important role in undermining the claims for authority advanced by Locke's opponents.

Simmons maintains that while Locke defends a right to resistance to tyranny, he does not argue that we have a duty to resist. According to Simmons, Locke believes that "we have the right to aid the oppressed, but not a duty to do so," although Simmons believes that Locke should have defended the duty of the people to resist injustice (pp. 179–81). Again, this seems to me to be a play on words at Locke's expense. For, in the seventh of the Essays on the Law of Nature, Locke elaborates upon the duties and obligations placed upon individuals by natural law, which include "the relief of one in trouble," as well as "the consoling of a distressed neighbor" and "the feeding of the hungry." It seems to me that "the

relief of one in trouble" covers the case of individuals being wrongly imprisoned and/or tortured because of their religious or political beliefs, which was certainly relevant to the argument for the right to resistance Locke was making in the *Two Treatises*. The fact that these duties (including charity to the poor) depend upon individuals' having the resources to implement them (which, in the case of resistance, may, as a prudential matter, require at least the tacit support of the majority) does not, in Locke's view, remove them from the status of being duties, as Simmons suggests.

The major portion of On the Edge of Anarchy is concerned with Locke's theory of consent and various suggestions for improving that theory. "Locke's real mistake," Simmons argues, "was in saying that one could only become a member [of political society] by express consent" (pp. 89, 194). Since Locke means actual personal consent (p. 60), we are faced with either an empirically implausible condition for establishing the legitimacy of government or with the attempts of Locke (and other consent theorists) to conflate express and tacit consent to the point where the very meaning of express consent is undermined (pp. 86-87, 197-269). Moreover, Simmons follows John Plamenatz and others in arguing that Locke's usage of the term consent has no reference to any particular form of government (p. 91). Hence, as a general characterization, "the problem for consent theory . . . [is] one of realism" (p. 199). It is hardly possible here to discuss (let alone resolve) the various problems arising from consent theory; but instead of condemning poor Locke for his lack of realism, it might be more profitable to recognize the existence of at least three linguistic conventions in seventeenthcentury England that did associate consent with the existence of elections and democratic practices, so that the historical plausibility that Locke's discussion of consent in the Two Treatises is grounded in a realistic attempt to associate political legitimacy with the existence of such practices can at least gain a fair interpretive hearing, instead of being dismissed out of hand as an expression of Locke's "own meaning" (as it generally is by philosophically oriented interpreters of that work).

None of my comments are meant to suggest that On the Edge of Anarchy is a bad book. On the contrary, Simmons has many intelligent and thought-provoking things to say about Locke, and he is both painstaking and comprehensive in his efforts to relate his own position to the existing secondary literature on Locke. Even so, On the Edge of Anarchy does demonstrate that there is still a gap between those who believe, with Plamenatz, that history and politics simply provide the background information for philosophical analysis and those of us who argue that what the philosophical problems are, for a thinker like Locke, cannot be stated independently of a contextual (political/historical) knowledge relating to the formulation of these problems.

University of California, Los Angeles RICHARD ASHCRAFT

Liberal Nationalism. By Yael Tamir Princeton: Princeton University Press, 1993. 194p. \$24.95.

Yael Tamir's Liberal Nationalism is a philosophical essay on a subject of central importance in today's

politics. Inspired by her involvement in the Israeli peace and civil rights movements, it attempts to reconcile two sets of seemingly contradictory values on which both movements are based: the values of liberalism and of nationalism. The purpose of the book is to redefine "the national vision" in the light of liberal values, to place "national thinking within the boundaries of liberalism" (pp. 3-4, 12). Tamir believes in the possibility of "an ideal marriage" between the two, in that "the liberal tradition with its respect for personal autonomy, reflection, and choice, and the national tradition, with its emphasis on belonging, loyalty, and solidarity, although generally seen as mutually exclusive, can indeed accommodate each other" (pp. 6, 140). Such accommodation, she claims, will benefit both traditions: liberalism will be rendered more attuned to people's deep affective needs, as well as more honest (aware of its own hidden nationalist agenda) and less egoistic, while nationalism will thereby be enabled to meet "the challenges of the next century" (p. 77).

Liberalism, in Tamir's discussion, is defined essentially as "a theory about the eminence of individual liberties and personal autonomy"; nationalism is defined as a theory "about the eminence of nationalcultural membership and historical continuity, and the importance of perceiving one's present life and one's future development as an experience shared with others" (p. 79). Speaking about nationalism, Tamir employs the terms of communitarian discourse, which, she claims, is "akin to the nationalist one in its content" (p. 14). The "nation," on which the definition of nationalism is predicated, is seen as a form of cultural community "imagined" by its members as distinct from others. Tamir is aware of the "illusive" quality of this definition, which does not allow to distinguish between nations and other cultural communities, but she believes that a more satisfactory definition is impossible (pp. 9, 66). The model of liberal nationalism that Tamir offers presup-poses the "contextual individual," for whom personal autonomy is as essential as embeddedness-the two needs liberal nationalism satisfies (pp. 33, 104-7). Liberal nationalism is polycentric, it "is predicated on the idea that all nations should enjoy equal rights, and in fact derives its universal structure from the theory of individual rights found at its core. If national rights rest on the value that individuals attach to their membership in a nation, then all nations are entitled to equal respect" (p. 81; see also p. 9). Liberal nationalism is best realized in the framework not of nation-states but of multicultural regional entities—political, military, and economic unions of separate but equal nations—each assured the conditions for cultural self-determination, which enable individuals to choose their national identities for the only relevant (i.e., "national-cultural") reasons (pp. 151-57, 163).

Tamir is aware that "recent versions of nationalism seem to lend little credence to the liberal nationalist position" she offers. In fact, she says, "a cursory glance at the surrounding reality could easily lead to the conclusion that liberal nationalism is a rather esoteric approach" (p. 117). Why should this be so? Why should nationalism, in reality, so often take illiberal forms and inspire political systems not even remotely resembling Tamir's ideal vision? The book does not address these questions and, taken on its own terms, cannot be criticized for that. It is an essay in philosophy, a "normative [and] programmatic" statement, rather than em-

pirical investigation; Tamir's goal is to suggest a model of nationalism compatible with liberal tradition, not to explain nationalisms as they are (pp. 6, 81). But in this day and age, questions raised by such nationalisms force themselves upon us and one can hardly resist the temptation to ponder them.

One central fact about nationalism as it exists is that it is not a uniform phenomenon. Rather than being a theory comparable to liberalism, it represents a class of theories, all of which share the definition of the political community as a "nation" (implying popular sovereignty and essential equality between members) and can differ dramatically in all other respects. All nationalisms satisfy and recreate a need for dignity, or (as Berlin, quoted by Tamir, defines it) status and recognition-which, in the absence of alternative ways to satisfy it, assures the continued appeal of nationalism. Different nationalisms, however, satisfy this need in very different ways and, in doing so, generate additional needs peculiar to them. In concrete experience, the abstract value of a "membership in a nation" is eclipsed by the value of a membership in a particular nation, with the particular satisfactions and comforts it affords. Being a member in a nation does not define one's identity: one is an American, a German, or a Russian—a member in the nation, defined as a community of free individuals, a superior race, a military superpower, a cultural giant, or the like. Very often, the satisfaction afforded by membership in the nation is predicated on the assumed inferiority of other nations, deemed to be undeserving of equal respect with one's own. Membership in a nation implies participation in the national ideals. These ideals differ: a supreme good for one nation may be an object of contempt for another. The nature of the national ideals defines the type and the specific character of any given nationalism. Liberal nationalisms are nationalisms based on liberal ideals. They are rare because illiberal nationalisms (of which there are many) are more effective in satisfying their members' need for dignity—perhaps because they relieve individuals of personal responsibility and define dignity as a collective attribute.

"Placing national thinking within the boundaries of liberalism" may, therefore, be equivalent to the attempt to combine different types of nationalism, subsuming an illiberal nationalism (e.g., the ethnic and collectivistic variety) under a liberal one and transforming the former into the latter, thereby changing people's ideals and aspirations. "Can this be done?" is a question of a great practical importance. Such a transformation of national identity, for example, is a necessary condition for the democratization of post-Soviet societies. Tamir constructs a philosophical ideal of nationalism, but in leading the reader to questions such as this, she also performs a valuable service for those who try to understand its reality.

LIAH GREENFELD

Inequality. By Larry S. Temkin. New York: Oxford University Press, 1993. 352p. \$49.95.

Larry Temkin, an associate professor of philosophy at Rice University, has undertaken a daunting task. Observing that philosophers have written scores of books and journal articles in recent years in defense of egalitarianism, what he finds missing from their collective enterprise is any discussion of how one might go about measuring the degree of inequality between alternative "worlds." While economists have discussed various ways in which inequality might be measured, philosophers have remained largely unaware of, or impervious to, their efforts. Temkin examines the work of the economists, but that is not his essential mission; rather, it is to apply a "Sidgwickian methodology" and the modus operandi of analytic philosophy to "explain, and ultimately guide, our egalitarian judgments," our "egalitarian intuitions" (pp. 5–6).

This mission—of determining when one situation is worse than another in respect to inequality—is a tricky, "complicated" business, one that requires scrutiny of competing principles of equality that have been promulgated by various schools of moral philosophy. These principles are often in conflict and thus lead to divergent assessments of how two competing "worlds" compare to each other. Temkin plays off these theories in myriad combinations, hoping to refine "our intuitions" about equality into "considered judgments." By distilling out equality from other desirable moral values, he hopes to understand it better. That understanding, then, can be factored into an "all-things-considered" judgment that takes other values into account. Only then can conclusions be reached about public policy.

Proceeding, as Sidgwick suggested, by beginning philosophical exploration with our ordinary moral judgments (both intuitions and underlying principles), Temkin seeks a coherent explanation of these "pretheoretical egalitarian judgments" that will enable us also to refine—and, where necessary, revise—these initial intuitions. He opens with a definition of who an egalitarian is—someone who cares about equality in itself, over and above its role in promoting other values. Excluded from the fold are some self-professed egalitarians whom Temkin calls "humanitarians." They are excluded because, while they favor transfers from the better-off to the worse-off, their sole objective is the improvement in the lot of the worse-off. Thus, they would be indifferent as between a regime of redistribution that took some "welfare" from the rich and gave it to the poor and a regime that made the poor and the rich both better off.

Inequality's intended audience—whose intuitions he counts on-is the "pure," "extreme" egalitarians-a by-no-means-insignificant cohort among today's moral philosophers. Their shared intuition, he argues, is that 'undeserved inequality is always objectionable; whether or not it is unavoidable, any one is responsible for it, there is anyone for whom it is worse, or it involves different people, societies, places or times (p. 12). Temkin states that he will not defend this position: his purpose is elucidation, not justification. Other intuitions follow. It is a natural injustice for some to be born blind and others not: it is simply unfair. It is a social injustice for some to enjoy more welfare (left undefined) than others. Something needs to be done to remedy both sorts of injustice, because the social builds upon the natural. Those who are worse off have genuine complaints, and it is their complaints that matter. Temkin will try to measure and compare these complaints in various worlds.

Temkin's "impersonal teleological view of inequality" leads him to explore alternative "worlds" all exhibiting the same three basic characteristics: (1) the better-off are not responsible for the inequality that exists, either directly or through resistance to sharing their good

fortune with the worse-off; (2) people are equally skilled, hardworking, and morally worthy; and (3) those who are worse off are in that position through no fault of their own. This should sound familiar; for Rawlsian counterfactual, "original position" theorizing has permeated moral philosophy in this country for over two decades.

With few exceptions (for cases of deserved inequality, which are acceptable but left undefined), these are worlds in which no one deserves anything, including talents and attributes. It is a universe in which useful things can be said about equality by comparing pairs of worlds, each represented by two rectangles varying in height depending on the welfare levels of two groups (the better-off, the worse-off) and varying in width by the number of people in each of the two groups. A goodly portion of the book is devoted to an examination of a sequence of 999 worlds that begins with a first world of 999 individuals who enjoy a high standard of welfare (left undefined but not just utility and not just measured in monetary terms) and one person who experiences a low standard of welfare. The world that occupies the median place in the series has 500 people at high welfare and 500 at low. The final world has one at high welfare and 999 at low. The question, to be probed at great length and in exquisite complexity is, Which world is better in "respect to inequality"? Does this sequence go from bad to good (because we are more attuned to inequality when it affects an individual or a small group), from good to bad (because some of our intuitions lead us to be more offended when more people are worse off), or from good to bad to good (because the first world deviates only slightly from equality, the middle world is the worst, and the progression from midpoint to the final world is on the upswing toward nearly perfect equality), or are all 999 worlds equivalent?

In examining these competing explanations of the sequence, Temkin considers "at least twelve different aspects or positions underlying or influencing our egalitarian judgments (there may be more)" (p. 50). It is a testament to the author's diligence that he kept count. The reader is treated to a richly textured (or stultifying, depending upon one's tastes) exploration of the interplay among a maximin principle of equality, an additive principle, a weighted additive principle, a relative-to-the-average-view-of-complaints principle, a relative-to-the-best-off-person principle of complaints, and a relative-to-all-those-better-off principle of complaints, among others.

Temkin makes few absolute judgments, preferring a "some people might oppose/many would claim" approach. However, the judgments that he does make seem dubious at best. Since he does not provide knockdown arguments in defense of any of his judgments, they are difficult to criticize and even more difficult to accept if one does not share the author's initial intuitions about equality. Some of these judgments are that if improvements to the better-off can be made without worsening anyone's welfare, this would be bad, whereas worsening the better-off without aiding anyone else would be good (p. 87); that egalitarianism is comparative, so that an egalitarian has "no intrinsic concern with how much people have . . [but] with how much people have relative to others" (p. 200); that the slogan "One situation cannot be worse (or better) than another if there is no one for whom it is worse (or better)" deserves to be seriously challenged; that in the 999-world sequence, the worlds first get worse then better; and that for any two reciprocal worlds in the sequence, "that one

will be worse whose better-off group is bigger" (p. 297, my emphasis). The last claim means that the last world is better than the first: it is preferable to have 999 people at low welfare and one at high than 999 well-off and one not.

These last two claims about the sequence are "pretty uncontroversial," Temkin thinks, and he simply "assumes that they are correct"; this lack of argumentation at such critical junctures is rather maddening in its own right, but even more so when, on the very next page, in an example supposedly illustrating the claims, one reads that "between reciprocal worlds, that one will be worse whose better-off group is smaller (pp. 297-98; my emphasis). This contradiction is undoubtedly the result of inadvertence; but there is a deeper problem here, namely, that one reader at least cannot state with conviction which view Temkin endorses—and this discussion is in a concluding section labeled "Practical Implications." Here, too, Temkin seemingly disregards his own repeated imprecations that "some of the conclusions reached may not be generalizable to the real world" (p. 29) and proceeds to generalize without any indication of how equality ought to be weighed against other, often competing, moral values. Thus, we need to rethink our quest for equality of opportunity, because it will lead to greater inequality by producing a meritocratic society with the talented of all races and genders winning the social, as well as the natural, lottery

Inequality concludes with a declaration that our "pretheoretical intuitions need revision in light of moral theory" (p. 302). Yet one is left with the nagging thought that perhaps it is the moral theory itself that needs revision. For nonegalitarians, the vexation goes even deeper, to the very intuitions that undergird the entire project. Why set up an idealized, counterfactual world in which no one is responsible for anything, no one deserves anything? (When economists theorize from an abstraction of human nature, the model, representing people as self-interested maximizers who know their own interests and prefer more utility to less, is at least recognizable. That is why the deductions of economists bear a relationship to how people actually behave in markets. Beginning from counterfactual assumptions, it is also not surprising that Temkin's mission, as it progresses, moves further and further from reality.) Why assume that what matters to people is comparing their welfare to the welfare of others? Why model the world in a way that gives central position to complaints, that is, to envy? Why should we care about equality in itself, irrespective of human welfare?

Political scientists, I suspects, will find this book bewildering. Particular aspects of the book will concretize our dismay. Chapter 3 is one example. The author conducts an "informal poll" by sending a questionnaire to 40 colleagues of his at the National Humanities Center, receives 10 responses, and then defends the sample as sufficient because the results cohered with those he achieved in the balancing-of-the-twelve-principles chapter. Chapter 10 provides another example. In discussing how our world relates to the worlds in the sequence, the author argues that our world resembles one of the later worlds, and to demonstrate this he cites sets of figures on inequality that are between two and three decades old. In an aside in the accompanying note, this lapse is explained: "Though . . . the particular data cited, is now somewhat dated, the basic pattern of inequality it suggests is unfortunately, not" (p. 302).

These two examples illustrate, one supposes, why philosophers are philosophers and not social scientists: all of the former's instincts draw them to the abstract, the otherworldly, the metarealm; all of the latter's inclinations lead them to the concrete, the empirical, the measurable (or at least, the observable). Thus, what precedes is the rather skeptical—some might say unduly harsh—assessment of a social scientist.

Bowling Green State University ELLEN FRANKEL PAUL

From Politics to Reason of State: The Acquisition and Transformation of the Language of Politics, 1250–1600. By Maurizio Viroli. New York: Cambridge University Press, 1992. 331p. \$54.95.

In 1612, Trajano Boccalini took a step beyond Giovanni Botero to do what would have been shocking and unspeakable to Brunetto Latini in 1266 or even to Niccolo Machiavelli in 1512. He gave to "reason of state"—that insidious art of preserving the state of a prince—the good name of "politics." To these earlier writers, the word *politics* picked out the art of ruling a republic according to justice and reason—however necessary it might be, given Italian realities, to read or write those very different discourses on the means of preserving a state. A revolution in "politics" had plainly occurred. Hereby hangs a tale of ideological innovation and conceptual change told with considerable erudition and detailed scholarship by Maurizio Viroli.

Across four centuries of Italian writers, Viroli narrates the acquisition and transformation of the language of politics. He begins in the late thirteenth century, when the linguistic traditions of political virtue, Roman civil law, and Aristotelianism provided writers on city government the semantic resources to conceptualize politics as the art of the republic. In the next century, the civic humanists completed the elaboration of the idea of politics as civil philosophy, glorifying it as the most excellent human endeavor. In their different ways, Machiavelli and (especially) Guicciardini gave unprecedented theoretical power to the upstart art of the state, but without conflating this art with the earlier and more noble one to which they (especially Machiavelli) also contributed. The last glimmerings of civil philosophy are seen in the later sixteenth century at precisely the time that the art of the state was elevated to reason of state and, soon enough, to politics itself. Attempts to restore the noble art of the republic proved impossible or in vain. The triumphant reason of state made of it "a language of nostalgia or utopia": "The story ends where it began: the same country where the language of politics as civil philosophy was born, nourished also the growth of its mortal enemy and grave-digger" (p. 280).

From Politics to Reason of State is an exemplary history of political thought and case study in conceptual change, executed roughly along lines charted out by Quentin Skinner, to whom the book is dedicated. Bidding us to leave aside our contemporary mental habits and linguistic usages, Viroli painstakingly excavates earlier languages of politics and the state through close textual readings informed by an impressive knowledge of different conceptual contexts. An imposing list of theorists (most of them heretofore unsung) is analyzed with care and clarity. Indeed, most readers will find (or take it on good faith) that the list of theorists is exhaustive; and

only a few will find it a little exhausting. Besides its intrinsic merits, the story that Viroli tells also provides him with the material in the epilogue "to prefigurate a conception of politics to which it is worth committing ourselves" (p. 10), namely, a restoration of civil philosophy itself.

In an otherwise excellent chapter on Machiavelli as master of the arts of both politics and state, Viroli sides with the view that the purposeful author of *The Prince* was attempting to educate "the one great political man" and perhaps engaging in a bit of "self-promotion," to boot (pp. 153, 177). But the case for this is less well argued than it should be, given the detailed linguistic work Viroli has put on display. The Medici lord to whom Machiavelli dedicated and submitted his treatise was not a "political man" (in his sense): he was a corrupt grasper after his state. Viroli notes how the advice on patronage is "unconventional" and "deliberately distorted," whereas that on the utility of fortresses is downright "subversive" (pp. 149, 151). Yet Viroli takes little advantage of his own tempting remarks, even after he goes on to acknowledge that in the History of Florence, Machiavelli disguisedly remained the "implacable opponent" of the Medici (p. 168). Whatever linguistic refinements he made on the concepts of politics and state, what Machiavelli the political man (in his sense, and ours) was doing in writing The Prince is still rather a mystery.

Mysterious, too, is how we can actually restore civil philosophy in our time. Having presumably been buried by reason of state in the seventeenth century, at least in Italy, civil philosophy's twentieth-century resurrection as "the art of the city" is a bit breathtaking. What sort of art, in the era of economics and the policy sciences? What sort of city, in the era of nation-states and transnational corporations? What will make civil philosophy sound like more than a few nostalgic sentiments about justice and friendship? Given such questions, it is surely very "strange" (as Viroli admits) to hear that such an art might form a discursive alliance with "the heirs of Kant and Mill," rather than "the contemporary advocates of republicanism" (p. 192). A historically informed civil philosophy may indeed provide rhetorical and theoretical resources to criticize statists, realists, participatory democrats, and communitarians. But one is tempted to ask exactly how civil philosophy and modern liberalism can cohere, cognitively and practically. After Viroli's careful linguistic work, one is tempted to ask how they can cohere "politically," as well. Worthy as the goal is, saying so will not make it so. Everything remains to be worked out. In the meantime, however, there is no doubt that "politics" in early modern Italy has received a first-rate chronicle. The memory it revives may yet assist the restoration of civil philosophy in our time.

JAMES FARR

The Problems of a Political Animal: Community, Justice, and Conflict in Aristotelian Political Thought. By Bernard Yack. Berkeley: University of California Press, 1993. 309p. \$45.00 cloth, \$14.00 paper.

Bernard Yack's new book is an incisive and well-written meditation on the inescapable conflicts that define human communities. Unfortunately, his title is a bit misleading, since the word *problems* implies that there

are solutions, whereas the whole point of his book is to show that the tensions and dilemmas of communal living are unresolvable. Moreover, his concern is not limited to political communities but includes families, friends, business partners, and even the passengers on a ship. Yack develops an Aristotelian theory of moral and political life in which conflict is seen not as the breakdown-but as the expression-of communal bonds. What this means is that the intensity of conflict is proportional to the closeness of the bonds—which helps to explain why, for example, police officers are often terrified of domestic disputes. Yack uses this dialectical unity of conflict and community to explore a variety of major themes in Aristotle's thought, including teleology, friendship, justice, the rule of law, class conflict, and the good life. In every case, his mode of analysis brings valuable and interesting aspects of Aristotle's thought into focus.

Yack carefully positions his argument in relation to individualist and communitarian interpretations of political community. Indeed, his book is as valuable as a guide to the current interpretative debates about Aristotle as it is to the writings of Aristotle. Against the individualist view that community is merely an instrument for pursuit of an individual life plan, Yack argues that we are by nature communal animals, whose identities are largely the product of our social relations. But against the communitarians, he insists that community is not the locus of harmony and integration but of conflict and division. And against perfectionism of all stripes, Yack insists that our conflict-ridden communities are an inexorable part of the human condition: there are no transpolitical ideals toward which politics can progress. To use Oakeshott's image, the only anchor available to the ship of state is a "sea" anchor. The domains of conflict may change over time but not the nature of conflict. Finally, against all kinds of nostalgia for the alleged harmony of the Greek polis, Yack insists that we are fundamentally in the same contentious political boat as Aristotle's Athenians (which is why Aristotle's relections on politics never lose their relevance).

Yack's Aristotle might be called a "Hobbesian communitarian" because of his paradoxical emphasis on both conflict and community (though this is equivalent to saying that Aristotle is neither a Hobbist nor a communitarian). According to Yack, the debate between individualists and communitarians remains wedded to the superficial contrast of society (Gesellschaft) and community (Gemeinschaft): modern, or urban, society is the locus of exchange relations among competing individuals, while traditional or rural community is the locus of shared moral bonds. Drawing on the sociological insights of Durkheim and Simmel, Yack blurs this contrast by showing that the exchange relations of society presuppose communal norms of good faith, while the shared moral bonds of community are often the product of exchange and other kinds of reciprocity. Aristotle did not need Durkheim, says Yack, to teach him that human community is built from the complementarity—not the similarity—of its members. Beginning with marriage, we form communities with individuals who are different from us, so that through division of labor and exchange, we may benefit from the pooling of individual talents. Who wants to go to a picnic where everyone brings the

But if difference is the precondition for community, it

is also the precondition for conflict. Because of our differences, we have different views of the ratio of contributions to rewards in the give-and-take of communal life. In the absence of a common metric by which to measure the different kinds of contributions to the common good, there is no calculus to determine the right distribution of rewards. (Yack does not evaluate the claims of libertarians that the market effects such a calculus.) The conflict over distributive justice is bitter to the extent that communal bonds are strong, for we are most likely to feel betrayed by those to whom we are closest.

Yack's emphasis on the conflictual dimension of political community is especially revealing in his analysis of class conflict. Yack (following Finley and others) laments the conflation of all class struggle with Marxian class struggle. He defines Marx's class struggle as conflict between "groups of individuals who are hierarchically positioned within the process of production" (p. 211). Unfortunately, this does not do justice to Marx's theory, because, on this definition, one would expect the class struggle of feudalism to be between aristocratic landowners and peasants, whereas, according to Marx, the struggle was between the aristocracy and the bourgeoisie. These latter two classes represent not "groups hierarchically positioned within the process of production" but declining and rising modes of production, or the country and the town. Still, Yack's own interpretation of class struggle (especially ancient Athenian class struggle) does not depend on his interpretation of Marx. Yack argues, on Aristotelian grounds, that class conflict is most common among citizens, not between status groups: in ancient Athens, masters and slaves rarely fought, because they had little in common, but rich and poor citizens fought often, because they had political life in common. Each class felt betrayed by the other class, with whom it shared the political arena. Political friends make for class enemies.

Because politics has always been so conflictual, there has always been a longing for an escape from politics—a "final solution" to the "problems of a political animal." Yack explored some strategies for such escape in his first book, *The Longing for Total Revolution* (1986). There are several possible escape routes. The first—the quest for communal harmony—we have seen to be chimerical. Another, according to Yack, is legalism—the attempt to

set forth a code of laws, principles, and imperatives, based on human nature or human reason, that purport to define what justice once-and-for-all requires. Yack's Aristotle defines politics not as an attempt to embody any set of abstract principles but as the conflict over those principles—principles that are "essentially contestable." Thus, Yack (following Harry Jaffa and others) strongly distances Aristotelian natural right from any kind of natural law. Yet he acknowledges a kind of procedural natural law principle of justice when he says, Nature thus tells Aristotle who can participate in deliberation about political justice but not what they should choose" (p. 149). Since nature endows human beings with reason and speech (in order to discriminate between the just and the unjust), by nature, all rational agents should be allowed to participate in politics. But Yack denies that Aristotle has any natural law principles to decide substantive questions of political justice: when it comes to such principles, we are on our own. Aristotle, in short (unlike Rousseau, Marx, and Nietzsche), never yielded to the temptation to suggest an escape from politics.

Aristotle says that in order to become a good person we need three things: nature, habit, and reason (Politics 1332a40; see also Nicomachean Ethics 1179b20). We begin with our natural aptitudes; these are then shaped into habits; and finally, we use our reason to reflect upon our habits and to form new habits. At the political level, excellence requires the right human nature (shaped by eugenics), the right customs, and the right laws. Habits or customs presuppose nature but cannot be reduced to nature, while reason presupposes habits without being reduced to habit. In their accounts of Aristotle's ethics, different scholars emphasize one or another of these three elements. Roger Masters, in The Nature of Politics (1989), emphasizes human nature; John Finnis, in Natural Law and Natural Rights (1980), emphasizes reason; and Bernard Yack emphasizes the social inculcation of habits. Each account is thus equally valid and equally one-sided. What is needed is an account of Aristotle's ethics and politics that not only includes nature, custom, and reason but also shows how each element is related to the others in Aristotle's dynamic model of human flourishing.

JAMES BERNARD MURPHY

AMERICAN POLITICS

Real Choices, New Voices: The Case for Proportional Representation Elections in the United States. By Douglas Amy. New York: Columbia University Press, 1993. 278p. \$32.50 cloth.

Restoring Real Representation. By Robert C. Grady. Urbana: University of Illinois Press, 1993. 170p. \$29.95 cloth.

As the titles of both books indicate, these works set out to make a case for improving representation. Although both do a fine job of laying the groundwork of their theses, they make a less than convincing case that their proposed reforms would in fact *improve* the quality of representation.

The key shortcoming of both books is that the authors overlook—or at least do not address—a key lesson to be drawn from Hannah Pitkin's *The Concept of Representation* (1967). Representation is a complex, multifaceted notion which has several manifestations which are not necessarily mutually compatible. Both Grady and Amy fail to acknowledge, despite the earnestness of their endeavors, that they have merely taken stands at and in favor of different points along a representational continuum. Thus, while both books' arguments for change provide ample food for thought, readers are likely to be left wondering if the proposed changes would produce the benefits that the authors contend.

Grady begins by lamenting the "displacement of popular representation in favor of interest group representation" (vii) which is symptomatic of interest group liberalism (p. vii). He seeks in this admittedly polemical work to "make participation and popular representation once again central to governance" (p. 5).

Contending that the current state of liberal democracy diminishes the value of popular participation and civic responsibility, he seeks to remedy this as well as the lack of government accountability that characterizes interest-group liberalism. To do so he develops a vision of political participation which is a hybrid drawn from the confluence of participationist theory and corporatism "by combining corporatist functional jurisdictions, which interact with public officials and complement the roles of elected legislatures, and participatory practices within such jurisdictions" (p. 8). While retaining the corporatist structure, he extends his participationist vision to include other interests or private associations all of which are grouped under his heading, democratic functional constituencies (DFCs).

If all of his conditions were met, Grady's vision would certainly lay a coherent theoretical groundwork for a system in which voters would be provided with more incentives and opportunities to participate meaningfully in governing and, as a result, become better citizens. In Grady's vision, the government would delegate authority to DFCs (which, by definition would be democratically run) and do so with strict guidelines which would limit the discretion that the DFC leadership could exercise in pursuing a given governmental end (p. 142). Such an arrangement would enhance the tie between the government and the people who participate in various DFCs while ensuring that those who worked with the

government would not behave in the egoistic manner that characterizes interest-group liberalism.

A key proviso is that such a delegation would, by definition, be in "the public interest." It is here that Grady's argument becomes harder to follow. Insofar as he distinguishes between the public interest and the desires of the organized interest groups, Grady seeks to ensure that these discrete interests would be subsumed by some greater public interest which would be determined by legislative deliberation and made manifest in the clear guidelines which would accompany any delegation to a DFC.

This begs the question: from where would these public-spirited legislators emerge? In part, Grady's answer is implicit: the beneficial impact of workplace democracy in DFCs would manifest itself in the voter's choice of legislators. However, Grady never really explains how citizens, who would apparently define their vision of the political in terms of their DFC activities, would separate their DFC agenda from the public good when it came time to elect a legislator. As well, Grady himself admits that, somehow, legislators and DFC leaders would need to be coaxed away from behaving as they do under interest-group liberalism in order to act instead in the name of some public interest. He does not, however, explain how feasible or likely this would be.

This begs a second question: How would the truly public interest be discerned? Insofar as the legislators' restrictions would be made clear in a delegation of authority, their vision of "the public interest" could be made manifest. However, since Grady does not define what would count as truly public-spirited legislative deliberation, he offers no measures for determining whether or not the legislature was actually behaving.

Clearly, Grady places a premium on participation as the groundwork for a more legitimate governmental process. Yet he does not address whether mere participation is in fact tantamount to having one's interest represented more effectively. Granted, Grady's work seems premised on the assumption that with time the public interest would become clear to all and that individual interests would succumb to or be included as part of it. In this respect, the notion of representation qua the voicing of or "standing for" particular and discrete interests would be meaningless since the public interest (or at least an enlightened self-interest) would, ideally, become a principal motivation for more and more political action.

Nonetheless, to the extent that legislative deliberation would be a key determinant of what the public interest would be at any given time, Grady's vision includes the possibility that even under his ideal conditions of public-spiritedness and participation, there would be competing views of the public interest. As a result, certain interests would lose out insofar as their elected representative might not agree with the legislative majority's deliberations.

Thus, to the extent that individual participation can be regarded as a surrogate for if not a replacement of interest representation, Grady's thesis is intriguing. Nonetheless, the question of whether mere participation

alone is sufficient to achieve satisfactory representation of interests remains an issue. This same problem also arises in Amy's discussion.

In seeking to make the case for America's conversion to proportional representation (PR) as a first step in curing the principal ailments of the political system, Amy begins with the assertion that "the American election system is unfair, outmoded and undemocratic" (p. 1). The system would improve if: gerrymandering were eradicated (chapter 2), campaigns were more issue-oriented (chapter 3), we broke the two-party monopoly (chapter 4), we elected more women and minorities (chapters 5 and 6) and more people participated in elections (chapter 7).

He explains that eradicating gerrymandering would minimize wasted votes. Issue-oriented campaigns would provide more meaningful choices to voters and PR would encourage parties to be more issue-oriented by removing the need to garner a majority of the votes in a district to win seats and legislative influence. Increasing the number of parties and increasing party discipline would also enhance the issue-focus and quality of voter choice. The election of more women and minorities would make legislatures more reflective of the population. And higher turnout would legitimate the government. This said, one cannot help but react with skepticism when Amy suggests that the root of evil is the single-member plurality system of voting (SMP) or that a conversion to some form of PR will solve all of these problems.

Proponents of PR have always contended that gerrymandering would become less of an issue because PR would create the possibility for multimember districts. It would also appeal to the aesthetic desire for a more accurate translation of votes into seats in any given election. The issue, however, of whether a conversion to PR would result in qualitative improvements in representation remains the source of an ongoing debate. Absent strong empirical evidence to support many of his contentions, Amy's argument in favor or PR remains quite speculative.

Amy himself admits at several points that his assertions are not grounded in empirical evidence. He argues, for example, that PR would lead to more issue voting (p. 70), yet he says forthrightly in an accompanying footnote that there is no empirical evidence to support this claim. Similarly, his reliance on Blais and Carty (1990) to sustain his assertion that PR would increase voter turnout is, as he points out, qualified by

the fact that they could not explain why countries that

employ PR systems tend to have higher turnouts than those with SMP.

Even if a conversion to PR were to bring about some of the changes that Amy suggests, whether or not it would result in representational improvements remains the focus of a debate that has continued for some time. While a more accurate translation of votes into seats in any given election might have a certain aesthetic appeal, PR does little for a minority if, having been shut out of legislative representation due to discriminatory laws, a particular electoral system or gerrymandering, it now has the privilege of seeing its interests or agenda defeated in the legislative bargaining process in proportion to it numbers.

Calhoun dealt with this over a century ago in his Disquisition on Government and Lani Guinier has echoed Calhoun recently in "The Triumph of Tokenism" (1991)

and "No Two Seats" (1991). Although both Calhoun and Guinier challenged the mathematical unfairness of SMP, both also acknowledged that mere proportional representation would do little more than establish a token presence in the legislature unless the minorities were given some sort of veto power which, for all intents and purposes, would give them *disproportionate* influence in the legislature. Amy, however, cites neither critic and, as a result, his contention that PR would be a panacea for all that ails SMP systems stands shaken.

Doubtless, Amy's book serves to reassert that there are indeed two sides to the PR-SMP debate, that both are grounded in thoughtful concerns about effective representation and that, perhaps, the debate still needs to be hashed out in the United States. In *Real Choices*, however, Amy does little more than cast his lot with PR's proponents. SMP may have its shortcomings, but it certainly has the support of many eminent scholars. He dismisses these concerns much too quickly. While devoting some 190 pages to advocating PR, he dispenses with the objections to it in a mere 30 pages. The result is that his approach to the issue lacks balance and the book reads more as a thoughtful polemic than an objective analysis.

In sum, both books are provocative, yet ultimately they fall short of their goal of setting forth convincing schemes to improve representation. Insofar as the representation debate has expanded beyond the notions of simply ensuring participation or obtaining a proportional presence (instead of some sort of proportional *impact*) in the legislative process, both Grady and Amy have added support to the respective aspects of the debate upon which their works focus. Both works, however, leave many questions unanswered.

MARK E. RUSH

The Rebirth of Urban Democracy. Edited by Jeffrey M. Berry, Kent E. Portney, and Ken Thomson. Washington: Brookings Institution, 1993. 344p. \$36.95 cloth, \$16.95 paper.

This is an earnest book and a good one. The authors seem torn between the optimism about neighborhood-based participation that is reflected in the book's title and their responsibility as social scientists to provide solid data and evaluate it with measured skepticism. While Berry and his colleagues occasionally lead with their hearts, their book offers a rich data base and serious analysis anchored in important concepts about power and democracy.

Much of what has been written about neighborhood organizations in the past has been thick with ideological celebration (leftist visions of a mass movement against the prerogatives of capital or rightist salutes to the ability of citizens to help themselves without governmental aid) but empirically spare. The authors provide an antidote to that trend. Their central theoretical issue is whether expanding citizen involvement leads to frustration, disorder, and delay (a prediction they associate with Joseph Schumpeter and Samuel Huntington) or to more satisfied, knowledgeable, and civic-minded citizens (as would be predicted by Rousseau, Mill and contemporary communitarians). Their empirical focus is on five core cities (Birmingham, Dayton, Portland, St. Paul, and San Antonio) selected because preliminary research

showed them to have unusually inclusive and effective mechanisms for citizen participation. In each core city, the authors surveyed about 1,100 residents, then reinterviewed most of them about a year-and-a-half later. A single wave of surveys was also carried out in 10 comparison cities chosen to match the core cities in size, race and class. In addition, in each of the five core cities, the authors conducted interviews with from 77 to 106 administrators, council members, neighborhood and community activists, and other political elites.

Perhaps the most surprising finding concerns the relationship between structured participation channels and actual levels of citizen involvement. Using a broad measure of community participation, the authors found that citywide structured systems for citizen participation did not generate higher levels of activity than were found in the comparison cities. Indeed, one of the core cities, San Antonio, had substantially lower levels of participation than any of the others; Dayton and Birmingham also scored in the bottom five out of the 15 cities. This finding led the authors to restructure the rest of their analysis. Rather than simply compare the five core cities to the others, they categorized all 15 cities based on two dimensions: the overall level of citizen participation and whether participation mechanisms were formally structured. This shifting of gears makes the analysis muddier and less well defined in places, but it allows for some interesting distinctions and comparisons. For example, compared to the cities with unstructured participation, the five core cities tend not to do as well in stimulating involvement by low socioeconomicstatus and minority citizens. But there is some evidence that the structured cities have a more positive impact on the sense of political efficacy and levels of political knowledge of those low-income and minority citizens who do participate.

The authors' predisposition in favor of structured participation mechanisms reveals itself in their choice of a frame of reference. In much of the book, they are content to strike blows against the belief that expanded participation will lead to elite dominance, intolerance, conflict, parochialism, and governmental paralysis. They make a convincing case that these fears are not justified. Neighborhood groups tend to serve as a counterbalance to business interests, to teach participants to be more tolerant of others, and to stimulate a sense of community. Public officials and nonparticipation citizens see these groups as legitimate actors that facilitate negotiation and compromise and, ultimately, better policies. Some readers however, will feel that the authors have delivered most of their blows to a straw man. The fear that participation will unhinge democracy is less common today than it was in the 1950s or 1960s, and its focus has never really been on the kind of structured, formally recognized, genteel and civilized forms of participation that characterize four of the five core cities considered here. (San Antonio's genre of participation is more free-wheeling and contentious; on the indicators that the authors care about, however, it does not perform nearly as well as the other cities)

A more reserved reading of the evidence they present might lead to a less exuberant endorsement of neighborhood associations than Berry, Portney, and Thomson end up with. Some of the findings they cite to discredit the notion that participation is destabilizing can also be read as evidence that these elaborate structures do not have very much impact one way or the other. They find

little evidence that neighborhood groups are a positive force in setting the local agenda; and they concede that neighborhood associations can rarely stand up to business when it comes to development issues of any size or of citywide consequence. Because they make no effort to quantify the cost of sustaining these institutions, they are in no position to conclude whether the small positive effects they uncover represent a decent return on the investment. Given the fact that they began their study by selecting cities that seemed to be models of success (the authors acknowledge that there were "few other cities that even came close to the five cities in the scope of their neighborhood-based citizen participation" (p. 294) the absence of more striking differences between the core cities and the comparison group is instructive.

It is premature to declare that the establishment of citywide, neighborhood-based structures for participation will bring about a rebirth of urban democracy. But this book is sufficiently sound and sufficiently stimulating to lead us toward a rebirth of interest in the topic as a focus of public debate and as a subject for scholarly investigation.

JEFFREY R. HENIG

Inviting Women's Rebellion: A Political Process Interpretation of the Women's Movement. By Anne N. Costain. Baltimore: Johns Hopkins University Press, 1992. 188p. \$28.00.

In less than 200 pages, Ann Costain analyzes the contemporary women's movement from roughly the 1960s through what she describes as its crescendo in 1975 to its current state of apathy and decline. She uses interviews and secondary archival research, as well as content analysis of news stories and official documents. The author is to be commended for integrating political process theory from sociology into political science. More specifically, she has made noteworthy contributions to the literature in establishing linkages between external political forces and ultimate governmental response.

Costain argues that the debate over what constitutes a social movement can be isolated into three competing schools of thought; mass society, resource mobilization, and political process. She sets the stage for her study by informing the reader of the theoretical development of the political process approach, which, according to Costain, grew out of resource mobilization theory. However, as opposed to resource mobilization theory, which concentrates on resources (e.g., entrepreneurial organizers), the political process approach places more emphasis on the political system, "indigenous accumulation of resources, and psychological aspects of movement identification" (p. 12).

The mass society theory, which characterizes William Kornhauser, Philip Seiznick, and Hannah Arendt's research into early twentieth-century European industrial societies, was according to Costain, applied to American politics in the early 1950s by Seymour Martin Lipset, Daniel Bell and Richard Hofstadter and, still later, by Ted Gurr in his *relative deprivation* variant. Costain then goes on the trace the development of resource mobilization theory formulated by sociologists in the 1970s to challenge mass society theory and relative deprivation (p. 6). According to Costain, resource mobilization the-

ory suggests that the principal problems confronting most movements can be traced to organization and the task of starting up while concurrently increasing new membership and retaining existing members. Costain cites the work of Robert Salisbury and his ideas about exchange in identifying ways that movements succeed. She feels that most research to date on the women's movement has adopted this perspective. She references the work of Gelb, Palley, Mansbridge, Conover, and Gray as being premised on resource mobilization. Costain also points to Jo Freeman's research, using relative deprivation, as work that also linked resource mobilization theory, in that it combined Gurr's work (women comparing their jobs and social prospects with men of the same age and educational background felt unfairly treated) with an early emphasis on the resources of communication networks needed to organize and spread information about the women's movement (p. 6). The author argues that the major implications of resource mobilization theory, as applied to the women's movement, are that the movement emphasized its nonthreatening characteristics (appearing politically innocuous) and that an early accumulation of resources followed from this focus (p. 9).

Costain feels that resource mobilization theory fails to explain early issues surrounding the women's movement, such as the public protest of the movement, the concerns of the early lobbyists for women's rights in the late 1960s and early 1970s, the larger questions of why women actually organized a social movement, the movement's rejection of hierarchical leadership (thus eliminating the most obvious means to accumulate resources), and the lack of large numbers of supporters of

the movement in its early years.

On the other hand, Costain posits that a political process theory can more accurately explain the development of the women's movement. In this approach, for a movement to emerge, its followers "must believe that problems have political roots and that they can do something to change existing conditions. . . . Most important of all, the government must at least be willing to tolerate the movement's appearance" (p. 12). Costain goes on to build on the work of Ethel Klein (Gender Politics) and others to test the two approaches empirically. Costain does so by coding events reported in the New York Times Index for the period 1950-86, contentanalyzing other secondary sources (papers of the National Organization of Women [NOW] and WEAL, the Congressional Record U.S. Statutes at Large) and interviewing lobbyists for women's groups and members of Congress and their staff. Her interviews spanned intermittent periods from 1974 to 1984. She uses discriminant analysis to assess how much influence region, political party and liberalism had on the individual decisions of members of Congress about whether to sponsor the Equal Rights Amendment (ERA). This was performed for each of the five Congresses in session (the Eightyeighth through the Ninety-Second).

Costain addresses such complex issues surrounding the women's movement in order to include the disunity among women's groups, the pro- and anti-ERA backers, the influence of such nationally organized groups as NOW and NWPC, the concurrent weakening of the New Deal electoral coalition and politicians' recognition of the female voting power, the influence of the chief executive and his leadership in the movement, and the downfall of the ERA and success of the Reagan administration in moving women's rights from an active to a largely symbolic agenda item (p. 120).

The author concludes that as women's groups marshalled their strength, Congress took the lead in boosting the legislative fortunes of the ERA: "As the ERA headed to the individual states in the fight for ratification, it continued to provide the prime catalyst that united and energized the women's movement" (p. 78). She argues the peak of the women's movement coincides with the high point of media attention given to the ERA and a sharply concentrated focus on legal equality as a solution to women's concerns. Costain feels that these equality issues triumphed over the alternative agenda emphasizing special needs, or needs that government should address because of biological, physiological, and familial differences: "This new predominance of equality issues over special needs was less a choice of the women's movement than of the legislative and executive branches of government. . . . However, the increasingly single-minded focus on the ERA set the stage for a decline in the women's movement visibility in the 1980s" (p. 99).

Costain recognizes the problems inherent in establishing linkages between external political forces and ultimate governmental action as a result of this political pressure: "Discerning the balance between government response to outside pressures and internally generated initiatives on women's issues is more difficult than it first seems" (p. 42). She also recognizes the problems that scholars have encountered in using content analysis as a method for establishing this linkage. For example, she mentions the bias in the higher probability of ' news," including demonstrations, riots, and other events to the exclusion of "soft news," including political speeches and other more analytical exchanges. However, she does not fully explain her motivation for excluding editorials, letters to the editor, comments, and other opinion-type pieces. She does point out: "Most scholars who employ events data exclude from event totals all editorial or other New York Times-generated stories, such as retrospectives on the movement or Sunday magazine articles. That practice was also followed here to cut down on the extent that New York Times' editorial judgments might skew the results" (p. 15–16).

However, since Costain relies primarily on analysis of secondary sources for much of her interpretation of the movement and for her efforts to link newspaper accounts and other documents to the political process, it would seem that some sort of analysis of editorials and thought pieces to accompany her events analysis would have enhanced, and added further credibility to, her study. This would especially appear to be the case in establishing linkage between the key political players she interviewed, what the newspaper was concurrently reporting, and the ultimate fallout from the political process. For example, would not the editorials and other opinion pieces have further reflected the movements' success and/or failure in setting an agenda item for government leaders to consider? This would seem to be the case especially because large numbers of governmental leaders acknowledge the influence of the New York Times. For example, the question arises, "Was the ERA the leading issue reported by the New York Times because of its significance for equality for women in our society or because the news media tend to focus on events, as opposed to issue analysis?" (see p. 79). Also,

era.

especially with regard to the linkage aspect, it would appear that her study would have withstood closer scrutiny had Costain also related her findings from her content analysis more specifically to the information gleaned from her interviews. For example, how were members of Congress and lobbyists specifically influenced by the events reported at the time? What role did they see themselves playing in the women's movement? What were their specific observations at the time with regard to equality for women? I wish Costain had used her interviews extensively to establish clearly just how the government facilitated the movement's success and, specifically, how pressure from various groups brought about this political change.

Nonetheless, Costain's research answers more questions than it leaves unanswered. Her work is clearly organized and written, and she makes a significant contribution to the existing literature. Finally, her research succinctly portrays the successes of the women's movement while summarizing valuable lessons learned along the way. This should be invaluable for future pursuits geared to improve the legal, social, cultural, economic, and political well-being of the American female.

LOIS LOVELACE DUKE

Legislative Leviathan: Party Government in the House. By Gary W. Cox and Mathew D. McCubbins. Berkeley: University of California Press, 1993. 324p. \$45.00 cloth, \$14.00 paper.

The conventional wisdom is tenacious. Political parties are weak in the United States. Indeed, congressional politics can be understood without factoring party cleavage or polarization into the analysis because the parties in Congress have declined. Or, congressional parties can simply be ignored, omitted from institutional analysis by assumption or stipulation because they are so ineffectual. Congressional politics are "committee-centered," gravitating toward autonomous committee work groups providing "subcommittee government" to the institution. Party voting is paltry, and in the event reflects merely the inexorable influences of largely incidental ideological or attributional commonalities among constituencies. Party organization is trivial, and party leaders are really only followers of the central preferential tendencies endemic within their party cohorts. Representatives care not for loyalty to their party, but only attend to their reelection the next time around. Put in its baldest form, the conventional wisdom about Congress truly is perverse.

Cox and McCubbins charge into this arena with genuinely stimulating argument and analysis. They argue that both the "traditional" and the "rational choice" views of congressional party politics are deficient. The traditional perspective overworks the extent of committee and subcommittee devolution of power, and underplays the coordinative leadership of congressional parties. The rational choice view, all too often, assumes political parties out of the model altogether. In contrast, say Cox and McCubbins, a careful analysis of the committee structure permits a variety of inferences indicating the existence of party government in Congress.

The authors' work entails manipulating an impressive variety and quantity of data. Their purview for testing

claims rests upon the House of Representatives. Most heavily relied upon are data for members' committee assignment and transfer requests from the 80th (1947-48) to the 100th (1987-88) Congresses. Ideological assessments are drawn from Americans for Democratic Action (ADA), Americans for Constitutional Action (ACA), and other interest group ratings developed from House roll-call voting. In addition, the authors make use of Congressional Quarterly's conservative coalition support scores, and the so-called NOMINATE scores (undimensional scale scores derived from all non-unanimous roll-call votes). A piece of the analysis relies upon four decades of congressional election data (1948-1988). The authors also use House roll-call voting from 1933 to 1987 to construct party leadership support (loyalty) scores for members for each biennium. Finally, selected data were gathered on bill sponsorship, and on majority and minority opinions in committee reports. To make a long story short, Cox and McCubbins' findings rest on analyses of substantial and impressive sets of data.

The principal findings from this research can be encapsulated blow-by-blow. (1) The House committeeassignment process does not appear to be one in which pure self-selection transpires, and there is plenty of room in selecting committee memberships for congressional party criteria and purposes to come into play. (2) Most House committees have memberships reasonably representative of the House as a whole in ideological or geographical terms, so most representatives "do not serve on committees that are dominated by preference outliers" (p. 79). (3) Analysis of the incidence of party voting in the House since the New Deal era of the 1930s indicates a shrinkage in party policy agendas, along with considerable stability in support among partisans for the majority (Democrats) party leaders' stands on policy issues and goals. (4) Party leaders demonstrably take party loyalty into account in making the committee assignments of freshmen representatives, and in determining the transfer of members from one committee to another. (5) That the majority party dominates committee deliberations is evidenced by patterns of bill sponsorship and dissents from committee reports on bills; majority party members sponsor most major legislation and dissent from committee reports far less frequently than minority members.

Cox and McCubbins paint a picture of congressional politics much different from the conventional view. To these authors, the congressional parties have not declined in the post-World War II years. Representatives come to Congress from a vortex of partisan electoral experiences. Intra-party ideological affinities are substantial. Members are pervasively loyal to their party leaders. The party leaders can exert considerable leverage over committees because they have "structured" the committee system itself, committee behavior tends to reflect partisan loyalties, and the party leaders tend to shape the legislative agenda. Indeed, the authors think that, in the House, "the majority party acts as a structuring coalition, stacking the deck in its own favor—both on the floor and in committee-to create a kind of 'legislative cartel' that dominates the legislative agenda' (p. 270). As in Hobbes's Leviathan, the governing representatives resolve collective dilemmas by establishing a central agency or authority, in the instance of the house by electing and following their party leaderships

Why have the congressional parties become more important in the last two decades? Cox and McCubbins

ask rhetorically, "Did parties, like Lazarus, rise from the dead?" (p. 277). They contend that "the parties never died . . ." but rather "that we have had a version of 'party government,' in the House at least, throughout the postwar period" (p. 277). But they also argue that, by the 1970s, the amelioration of the stalemate between northern and southern wings of the House Democratic majority—precipitated by the reduction in numbers and liberalization of Southern Democrats—permitted a series of decisions that empowered the majority leadership. Indeed, Cox and McCubbins argue that the committee reforms of the 1970s were understood by majority party leaders as a way to enhance their control of the legislative agenda.

I find this book enormously refreshing, even liberating. The authors begin the task of restoring political party politics and party leadership to their proper place in analyzing congressional life. The theoretical orientation advanced by the authors is a rational choice perspective, but the findings and implications of the analysis do not, in the end, depend upon this. Indeed, sometimes the rational choice lingo and formalization are more an interruption than illuminating. One chapter on collective dilemmas in general is very tedious, and in a few other places the argument degenerates through excessive abstraction. Beyond the authors' formalizing pretensions, the substantive argument will be vigorously debated by conventional congressional scholars who will cling to the "weak parties" or "no parties" assumptions and who can find allusions to "leviathan" and to a "legislative cartel" egregious, and by rational choice purists who may find that relaxing the ceteris paribus assumptions to which they have grown accustomed is a sop to institutional verisimilitude. But, on balance, I think this book is an important landmark on the road to a more interesting, more political, and a theoretically invigorating line of research on congressional politics.

Center for Advanced Study in the Behavioral Sciences and Ohio State University SAMUEL C. PATTERSON

At Women's Expense: State Power and the Politics of Fetal Rights. By Cynthia R. Daniels. Cambridge: Harvard University Press, 1993. 183 p. \$19.95.

Daniel's well-written and cogently argued book addresses the important issue of fetal rights outside the narrow context of abortion, where it is too often exclusively situated. Like Zillah Eisenstein (and Robin West), Daniels centers our focus on the pregnant body to expose the inadequacy of the liberal concept of "citizen" which is gendered male. Daniels carefully examines three legal cases to challenge the ability of classical liberalism's notions of individualism, privacy, and self-determination to defend women's rights during pregnancy.

Chapter 1, aptly entitled "Fetal Animation," traces changes in technology, rhetoric, and law on fetal rights. Each of the next three chapters spotlights one case. The 1987 case of Angela Carder erupted when hospital administrators sought and won a court order to perform a cesarian section on a woman dying of cancer over the objections of the woman, her doctor, and her family. Unlike the episode of *L.A. Law* based on the case, both

mother and fetus soon died. After reviewing the emergence of the fetus as a separate patient, Daniels draws on cases that similarly resulted in a violation of women's right to bodily integrity. Daniels reveals that only when women's commitment to motherhood is unquestioned, when women align themselves with powerful male organizations (in this case doctors), and when women can "degender" the threat to bodily integrity (in this case, constructing the issue as one of patient's rights) can they prevail. Carder's "success" consisted of a circuit court decision affirming the right of a patient to decide and the development of professional guidelines.

Daniels uses the case of United Autoworkers v. Johnson Controls to show how employers use gendered assumptions about women's reproductive capabilities and appropriate work to disadvantage them in the workplace under the guise of protecting their offspring. Johnson Controls "gender-cleansed" premenopausal nonsterilized (thus "fertile") women who worked in battery manufacturing from jobs that exposed workers to lead. Daniels brilliantly demonstrates how employer's rhetoric first creates a fissure between maternal and fetal interests and then blames women for adverse reproductive outcomes-shifting the circle of causality away from fathers or the hazardous work environment. Fetal protection policies construct employers, rather than women, as the rational protectors of the fetus. The Supreme Court's unanimous decision in 1991 declaring Johnson Control's policy in violation of Title VII of the Civil Rights Act of 1964 marks a shift from resolving ostensive conflicts between work and motherhood always on the side of motherhood.

Chapter 4 ("The Politics of Vengeance") explores the 1989 case of Jennifer Johnson, the first woman in the United States to be convicted for delivering drugs to a minor by "delivering" cocaine to her newborns through the umbilical cord. Daniel uses the Johnson case to analyze the myths about the pregnant addict in public discourse and to bemoan our collective need to blame individuals for social problems. She methodically considers the medical evidence generating the hysteria over "crack babies" and the role of the media in this episode. Even more so than "fertile" women, the pregnant addict is more easily constructed as irrational. By showing that black women are 10 times more likely to be prosecuted for drug abuse during pregnancy, for example, Daniels carefully documents how class and race affect constructions of motherhood and determine when state intervention is accepted as appropriate. The analysis in this chapter is superb and merits excerpting for those unable to use the entire work.

Those who teach law and society, women and the law, women and politics, feminist political theory, public policy, or even introductory women's studies courses will cheer the publication of this book. Daniels's prose is unusually clear, readable, and accessible to those with little background knowledge. Its length also makes it a suitable text or introduction. A virtue of the book is its crossing of legal subfields: it considers cases in constitutional, criminal, family, and labor law. Daniels's work deftly illustrates the dividends of employing gender as a conceptual tool to disrupt settled legal divisions. Unlike other legal scholarship, Daniels eschews the excessive legal citations and references to other scholars that often overwhelm the uninitiated reader.

This virtue is also a limitation. Daniels adds no new information to the stories of the legal cases. Nor does

she expand our understanding of legal doctrine. Her analysis is cursory about the social forces that produced these cases and the choices and strategies of the players (plaintiffs, interest groups, legislators, etc.) The book illuminates different aspects of the public policy process from those found in her previous scholarship. To regard these omissions as flaws, however, would be to miss the purpose and importance of the book. As a political theorist, Daniels employs careful analysis of contemporary cases to interrogate liberal individualism and rethink what constitutes citizenship. As a feminist theorist, she meets the challenge posted by historian Joan Scott to understand difference in a more sophisticated way and to unpack the gendering of social issues and concepts. She impressively meets the need to understand gender, race, and class as mutually constituting categories of oppression. In fact, the concrete illustration of this theoretically complex concept is one of the main strengths of the work.

Daniels's terse argument is unlikely to persuade those who do not share her assumptions about women's rights and reproductive choice, but that is not her aim. To those who feel discomfort when doctors perform cesarian sections over the objection of the woman, are aghast that women must be sterilized to hold a job, and look with unease on criminalizing pregnant addicts, this book powerfully analyzes each issue and brilliantly shows the connections between them. Her work is a major contribution to the emerging literature on this important topic.

University of Iowa

SALLY J. KENNEY

Regulatory Politics in Transition. By Marc Allen Eisner. Baltimore: Johns Hopkins University Press, 1993. 246p. \$45.00 cloth, \$14.95 paper.

One of the most exciting recent developments in political science is the attention devoted to historical analysis—the *rediscovery* of history, if I may be permitted a mild exaggeration. Clearly, the dominant and, to date, the most fruitful approach within the politics and history movement is institutional development. The pioneering work of Stephen Skowronek and Theda Skocpol laid the foundation for a burgeoning interest in the theoretical connection between institutional development and the broader evolution of political systems. Eisner's new book, *Regulatory Politics in Transition*, is a contribution to this literature.

Eisner presents us with a historical-theoretical essay that seeks to make sense of shifts in regulatory policy and politics in the United States. Drawing directly on Harris and Milkis's Politics of Regulatory Change (1989), Eisner sees regulatory politics as evolving from one regulatory regime to another. The major conceptual distinction between the two works is the relative emphasis placed on ideas in the emergence of regulatory regimes. Thus, Eisner defines a regulatory regime as "a historically specific configuration of policies and institutions which structures the relationship between social interests, the state, and economic actors in multiple sectors of the economy," while Harris and Milkis he notes, define the concept as "a constellation of (1) new ideas justifying government control over business activity, (2) new institutions that structure regulatory politics, and (3) a new set of policies impinging on business" (p. 1). Eisner

does devote considerable attention to ideas but does not accord them a primary role in explaining regulatory regime transition. Rather, the main trajectory of development runs essentially along the following path: economic change stimulates social groups' policy demands, which in turn give rise to a policy and reform agenda, out of which emerges new regulatory institutions and new policies. This process purportedly explains the emergence of four regulatory regimes in American history: the Progressive Era and the New Deal, both of which most scholars acknowledge without benefit of the regime framework, the societal regime of the 1970s, and the efficiency regime, which Eisner introduces to account for the Reagan and Bush administrations' response to economic stagnation and sharply increasing regulatory costs.

The major strength of *Regulatory Politics in Transition* is that it systematically assesses a defining element of the modern American state, namely, regulatory policy. Eisner correctly notes that the relationship between government and business provides an important window on political development. In addition, he strives to explain the unfolding drama of regulatory transition, as well as the roles played by the major institutional and organizational actors. In that enterprise, he invites us to examine critically the explanation he provides. Laudable as that enterprise is, it falls somewhat short, primarily because the framework of analysis weakens in its explanatory power as Eisner moves from earlier to later transitionary periods.

Eisner's conceptual framework is most persuasive in its application to the Progressive Era. For that period of regulatory development, he ably demonstrates how a momentous economic change (i.e., the transformation from an essentially regional and agrarian economy to a national and industrial economy dominated by large corporate organizations) evoked broad popular demands for government intervention. In addition, the connection is clearly drawn between popular agitation and the contemporary administrative doctrines, thereby explaining the character of progressive institutions and policies. Problems with this analysis begin to arise, however, as we move to the New Deal period.

The first difficulty is Eisner's designation of the Great Depression as the economic change variable in his framework of regulatory transition. While there is no denying that the Depression was an event of cataclysmic proportions, we may ask whether it is equivalent to the structural transformation of the economy described as the prime mover in the Progressive Era. An analagous transformation might have been the bifurcation of corporate ownership and control identified by Berle and Means, yet there is no real discussion of structural change. The question, therefore, is, What does the economic change variable mean? If it does not mean structural change but simply severe dislocation, we may ask why the severe depressions of the 1890s did not occasion the emergence of a regulatory regime. Further, if dislocation will suffice as a variable initiating the process of regulatory transition, how severe must the dislocation and accompanying fears of uncertainty be? The second difficulty in the analysis of the New Deal is that the role of "social group's policy demands" is assigned to "realignment" and the "formation of the New Deal coalition." Not only is there no satisfactory explanation of how social groups influenced either the 1930s realignment or the formation of the New Deal

coalition, but there is very little illumination of party politics outside of a discussion of FDR's Commonwealth Club Address and the 1932 party platform, neither of which, according to Eisner, shed much light on the New Deal regime that eventually took shape. That being the case, one may well ask if his causal mechanism of economic change actuating social groups to define a reform agenda is operative? Indeed, the greatest emphasis appears to be placed on the role of the brains trust and FDR's "legendary political skill," rather than the activities of social groups.

As Eisner moves to an application of his framework in the transition to the societal regime of the 1970s, more vexing questions arise about the causal variables at work. In his schematic representation of this transition, the economic change variable is designated as the "emergence of postindustrial values" and "social unrest of the 1960s." In all fairness, Eisner attributes postindustrial values to sustained postwar growth, though this linkage is asserted, rather than explicated. Still, it is difficult to rationalize the identification of emergent values and social unrest as economic change. Perhaps, with some more analysis, it would be possible to show that postindustrial values are an intervening variable connecting sustained growth in real incomes with social unrest, which in turn stimulated social groups' demands. However, this is not the model of transition elaborated at the outset. As in the case of the New Deal, Eisner does a very credible job of relating the general story of regime transformation but does not convincingly fit that story into the framework of analysis that he has laid out.

Finally, in the instance of the new efficiency regime that Eisner claims to have discerned, we find perhaps the most strenuous contortions to make the facts fit the framework. In this case, the economic change variable is "stagflation, foreign competition, and regulatory compliance costs." Presumably, this variable operated the same way as the Great Depression in evoking dislocations and uncertainty. However, that line of reasoning raises the same questions about whether economic change means structural change à la the Progresive Era or can mean simply economic hardships. If the latter will do to initiate regime transition, we face the severity issue: Were the economic problems of the 1970s (certainly less disasterous than the 1930s) severe enough to set in motion the forces Eisner postulates as the prime movers in regulatory transition? Here even Eisner cannot identify the forces he claims regularly operate. Specifically, no social groups' demands emerge that remotely resemble the kind of reformist agitation associated with earlier regimes. A telltale sign of Eisner's theoretical dilemma may be seen if we juxtapose his introductory assertion, "Rather than being the product of an oppressive elite or of a partnership between monopolies and the state, the major regulatory initiatives of the past hundred years originated in popular demands" with his argument that the efficiency regime "has its origins in elite politics and the analytic biases established as a result of administrative change" (pp. xiv, 172, my emphasis). Thus, Eisner abandons the principal causal mechanism of his analytic framework in an effort to explain the emergence of the efficiency

Ultimately the problem with this book's theoretical approach is probably that it tries to explain a recurrent phenomenon, regulatory regime change, by applying a

static model across historical time periods. At each stage of regime development, the very institutional changes that Eisner describes may have substantially changed the context in which he applies the model that works so well in the Progressive Era. Like many heroic efforts at explaining long-term political development, Eisner may have fallen short of his goal; but that places him in some illustrious company. Moreover, we are indebted to him for taking on such a challenging task both because he demands that we critically reassess our own notions of modern state building and because he provides a valuable account of regulatory politics over the last century. For the latter reason, I suspect that many of us interested in the history of regulation or business-government relations will be cribbing lectures from Regulatory Politics in Transition.

RICHARD A. HARRIS

The Shaping of American Liberalism: The Debates over Ratification, Nullification, and Slavery. By David F. Ericson. Chicago: University of Chicago Press, 1993. 238p. \$40.00 cloth, \$14.95 paper.

The Lincoln Persuasion: Remaking American Liberalism. By J. David Greenstone. Princeton: Princeton University Press, 1993. 312p. \$24.95.

The Lincoln Persuasion is a posthumously published book that is without two of the chapters David Greenstone intended for it to have, because they were not finished at the time of his death: one on the abolitionists Lydia Maria Child and Frederick Douglass and one on Daniel Webster. It is a shame to be without Greenstone's insights on these figures, but the book as an argument is substantially complete and does not suffer from the absence of these chapters. David Ericson's book derives, in part, from Greenstone's work (his book is dedicated to Greenstone's memory), yet there are significant differences in their understanding of American liberalism.

These two books continue an argument begun by Louis Hartz in modern American political science over whether American political life is, and always has been, fundamentally liberal. Against those such as Bernard Bailyn, Gordon S. Wood, and J. G. A. Pocock, who argue that one can find a dominant or at least significant preliberal republicanism in the eighteenth century and the founding period, both David Ericson and David Greenstone maintain that the character of American politics has been consistently liberal. Yet both believe that there is merit in the criticisms made of Hartz by his critics, and each adds to these criticisms. Each tries to save Hartz's basic thesis while admitting the meritorious criticisms by arguing that within America's basically liberal tradition, there are two forms of liberalism. Hartz's critics are wrong to think that there is a significant antiliberal tradition in America but right to think that there have been important disagreements and discontinuities (albeit intraliberal ones) in American thought and practice.

It is in identifying these two forms of liberalism and their significance for understanding the Civil War and the pivotal figure of Abraham Lincoln that the two books diverge. According to Ericson's construction, the common liberal tradition understands the purpose of government to be to secure liberty and protect rights. Within this tradition, there are two distinct species of

liberalism: republicanism and pluralism. The complicated distinction between these liberal species (16 propositions characterize republicanism) can be understood as presenting the two poles of a continuum. Republicanism emphasizes the importance of participation in free government and of the common good that liberalism entails, and pluralism emphasizes the importance of the private exercise of rights. Statesmen can then be placed on this continuum, and, Ericson argues, the history of American political culture can be understood as a movement from republicanism to pluralism. A concern for at least the instrumental value of civic virtue gives way to the unchecked pursuit of private ends. To show this, he examines three significant periods—those that saw the debates over ratification, nullification, and slavery. In each case, he argues that the form of the debate is determined by the relative dominance of the republican perspective (in the first two) or the pluralistic perspective (in the third), while the substance of the debate is decisively shaped by the relevant statesman's traditionalism, social realism, or nationalism.

According to Greenstone, the two species of liberalism are humanist and reform liberalism. Both kinds of liberals believe in the common liberal understanding that just government rests on the consent of the governed and has the aim of protecting individual rights and private property. Within this consensus, the humanist liberals are primarily concerned with the satisfaction of individual preferences, while the reform liberals are primarily concerned with the development of the faculties of individuals. Or (we may say), the humanist liberals are concerned with the exercise of rights, while the reformists liberals are concerned with the development of individuals who can exercise those rights well. (To illustrate, Martin Van Buren is assigned to the first camp, John Quincy Adams to the second.)

One result of these analyses is significantly differing views of Lincoln. For Ericson, Lincoln fits neatly (or almost neatly) within his scheme as a person with anachronistic republican tendencies but whose overall effect was to accelerate the inevitable triumph of pluralism. Lincoln is a significant figure (but only one of several) within the predictable history of American liberalism's movement from republicanism to pluralism. Greenstone presents a subtler and more interesting portrayal of Lincoln. He argues that Lincoln successfully reconciled reform and humanist liberal strands (unlike the reform-liberal abolitionists or the humanist-liberal Stephen Douglas). This reconciliation enabled Lincoln to arrive at a comprehensive and politically effective understanding of the slavery issue that drew on the deepest reaches of the culture, uniting the moral and religious intensity of New England Puritanism with political realism, prudence, and devotion to union. The result, argues Greenstone, was a new liberal synthesis that amounted almost to a refounding of the country. Few writers have had the appreciation for the depth of Lincoln's political understanding that Greenstone displays.

Both books contain observations and arguments from which one can learn. Yet both have a common and serious methodological flaw that unnecessarily narrows their perspective and confuses their arguments. Both Ericson and Greenstone consider the conversation in which they are participating as bound within the confines of academic political science (and only a portion of political science, at that) and refuse to consider the people they are studying as participants in this same

conversation. The result, in Ericson's case, is to confuse his argument with such infelicitously denominated distinctions as the one mentioned between "republican" and "pluralistic" liberalism. Republican is a term with an ancient lineage stretching back to classical antiquity; pluralism is a twentieth-century American invention. Does it really make sense to use these terms from such different contexts at the basic antinomies within Lockean liberalism? The answer, in case anyone is in doubt, is no. They do not clarify but, rather, confuse the issue and trivialize what is at stake in understanding republicanism or pluralism. If Ericson took more seriously, for example, the Federalist's claim to present the true understanding of republicanism, he could not use the term in the confusing way he does. Denomination of vague collections of beliefs would have to give way to a precise grappling with the issues that actually moved American statesmen. Instead of beginning with the issues raised by Louis Hartz, Ericson would have understood American liberalism better had he first feasted with Jefferson or Madison and then let Hartz come for dessert.

In Greenstone's book, one gets the impression of a naughty boy who is not supposed to talk to strangers outside of political science but who has perhaps secretly stayed up all night talking to Adams, Jefferson, and Lincoln. On the surface, he acknowledges only to having talked with Wittgenstein and the public choice theorists, and the poor reader must work awfully hard to see the choicer conversation in the depths. Greenstone would have us believe that Lincoln is all mushiness, a vague "persuasion" that cannot rival the precision of a political scientist. His account of Lincoln and his obvious admiration for him belie this impression, but Greenstone obscures his own account because he does not want to admit the company he has kept. Nevertheless, he does somehow see that the heart of the question about American liberalism is this: Does liberalism provide an adequate understanding of, and direction to, American politics, or does attentiveness to political life compel one to go outside of liberalism for this understanding and direction? And he sees that there is no better way to begin to come to grips with this question than to listen to Abraham Lincoln.

Why not admit that the person you are studying may wind up being your teacher or at least your colleague?

GLEN E. THUROW

The Craft of Justice: Politics and Work in Criminal Court Communities. By Roy B. Flemming, Peter F. Nardulli, and James Eisenstein. Philadelphia: University of Pennsylvania Press, 1992. 217p. \$24.95.

This is the third book based on a National Institute of Justice-funded study of the criminal court systems of nine middle-sized communities spread among three states (Illinois, Michigan, and Pennsylvania). In the first two books, Roy Flemming, Peter Nardulli, and James Eisenstein developed detailed arguments about the guilty plea process (*The Tenor of Justice*) and the nature of the interrelationships among the actors in the criminal court system (*The Contours of Justice*). Both are major contributions to the study of courts and criminal justice, and I have regularly used *Contours of Justice* as a text.

I had known for years that a third book was planned, and I looked forward to it as one might anticipate the last

part of a trilogy. Unfortunately, the result is more akin to a sequel to *The Contours of Justice*. This new book seeks to draw on the rich qualitative materials collected by Flemming, Nardulli, and Eisenstein in the nine communities studied, materials that had been used to some degree in *The Contours of Justice* and in several journal articles. The authors' problem was to find something to say that went beyond their previous discussions of guilty pleas and court communities.

The analytic vehicle the authors chose was a pair of metaphors: community (which had been used in The Contours of Justice and, to a lesser degree, in The Tenor of Justice) and craft (which had not been used in their previous work). The book is divided into three parts, each focusing on "the craft" of one of the core players in the court community (prosecutors, judges, or defense attorneys). The discussion covers political craft (for prosecutors and judges) and what I would label "frontroom craft" (the craft of dealing with what goes on in the courtroom itself) and "backroom craft" (the craft of preparing cases, bargaining, overseeing a docket, etc.): Throughout the discussion, the authors return to the community metaphor to emphasize differences and interdependencies that mark the phenomena they describe.

The problem is that while the metaphor of community works, the metaphor of craft fails, at least as used here. The community metaphor works, at least in part, because it is based on a solid conceptual foundation: it joins the ideas of "courtroom workgroup" and "local legal culture"—both developed by political scientists (including these authors) writing about the criminal courts in the 1970s. The key idea is that there is a community of actors, who form concentric circles of core players (prosecutors, defenders, and judges), peripheral players (political parties, news media), and outsiders who regularly become involved (defendants, voters). These communities are marked by interdependencies, norms, and sponsoring organizations. Importantly, there is a great deal of variety among the communities; and simple generalizations about how the criminal justice system operates (plea bargaining, impact of calendaring systems, etc.) are not possible.

Why, then, does the new metaphor of craft fail? Unlike community, the idea of craft, while it is something we are familiar with in common parlance, is not something that most social scientists have considered as a research construct. I was intrigued by the prospect of seeing the idea of craft applied to the work of the actors in the criminal justice system. However, I was disappointed by the absence of any systematic development of the metaphor, and I was struck by a lack of fit between the idea of craft and a lot of what is discussed in *The Craft of Justice*, much of which seems to have more to do with functions or tasks than with craft.

Even when the authors do define craft they do so inconsistently:

The craft of justice refers to how [the key players] pursue their individual careers, go about their tasks in the courtrooms, organize themselves for collective purposes, and interact politically in the institutional realm of the courthouse. Their craft is both practical and political; it refers to learned and adaptive knowledge that guides practitioners in getting things done within the courthouse. (p. 4)

Craft is practical knowledge of how others perform their work and of the relationships involved in this work. It combines personal experiences with the lessons learned by others so that legal practitioners can organize their work and manage their relations. (p 195)

I came away from these definitions quite confused: Why is knowing how to "get along" a craft (it is something that anyone working in a social setting has to do)? Why is knowledge of how others perform their work a key component of craft? Why is craft limited to practical knowledge? (Is the preparation of a legal brief not a fundamental component of craft?) What do calendaring systems have to do with craft? Why is the relationship of reputation to craft?

I could go on here with many examples. I am not suggesting that these are unimportant or uninteresting problems, only that the craft metaphor fails to inform. Of course, there are elements in the book that do clearly relate to craft. This seems particularly true in the discussion of defense attorneys. The best chapter in the book is one entitled "Defending in the Courtroom," which relates most clearly to craft-type issues (knowing when to file motions and when not, knowing when to go with an open plea, knowing how to "judge-shop").

In summary, The Craft of Justice is not as significant a

In summary, The Craft of Justice is not as significant a contribution to our understanding of criminal courts as were the previous two books that comprise the trilogy. Whether this is because the authors had really exhausted the core of their material in the previous two books or because they failed to capitalize on the theoretical potential of the craft metaphor is difficult to judge. In any case, the totality of Flemming, Eisenstein, and Nardulli's work in the nine-community study stands as a major contribution to the study of justice and politics in the lower courts.

University of Wisconsin, Madison Herbert M. Kritzer

Declaring Independence: Jefferson, Natural Language, and the Culture of Performance. By Jay Fliegelman. Stanford: Stanford University Press, 1993. 268p. \$32.50 cloth, \$12.95 paper.

Starting from the premise that the Declaration of Independence was meant to be read aloud, Fliegelman takes his readers on a high-speed chase across the landscape of American popular culture in the early national period. He argues that the revolution challenged Americans to "imagine social relations on terms other than familial" (p. 191). As the new nation embarked upon "the postcolonial project of deriving an indigenous identity from the creative appropriation of Old World materials as well as from their rejection" (p. 187), oratory became a crucial site for the reconceptualization of political authority and, ultimately, for the production of a distinctively American sensibility.

Before oratory could assume such a culturally central position, it, too, had to undergo a revolution. Thus, Fliegelman reconstructs the rise of an elocutionary ideal that was essentially performative and whose aim was to create a sympathetic identification between orator and audience. This new rhetoric treated the body as an instrument and focused on "sounds, tones, and facial expressions," rather than words and arguments (p. 48). Because the orator's task was not so much to express feelings as to call them forth in others, this ideal set in

motion (but also contained) a series of conflicts-between the natural and the theatrical, self-control and self-revelation, particularity and representativeness, and

imitation and originality (pp. 64, 89, 115).

Fliegelman is "concerned with rethinking and expanding the kinds of 'facts' that are traditionally judged to be relevant to understanding a major historical document"; "In the case of the Declaration," he argues, "those facts include . . . the structure of a fugue, the particular design of a chair, the way Jefferson wrote the letter s, accusations that Milton's Paradise Lost was plagiarized, and the eighteenth-century assumption that blacks are unable to blush" (p. 4). If this book does nothing more than alert students of political rhetoric to the wide range of cultural referents that might be brought to bear in their interpretations of texts, its author will have performed a valuable service. For some readers, Fliegelman's exuberance, erudition, and eye for the telling image will prove compelling. But those who approach the book more analytically—seeking either a fresh interpretation of the Declaration or a model for cultural history—are likely to be disappointed. Ultimately, Declaring Independence enacts the ideal it describes: its argument seems less important than the performance itself.

The book is full of interesting bits of information. We learn, for example, that the term responsibility made its first appearance in print in the Federalist and that the committee charged with drafting the Declaration of Independence also proposed a national seal whose iconography featured the Red Sea overwhelming a crowned Pharaoh after Moses and his people had made their way safely to the opposite shore (pp. 143, 160-64). But while Declaring Independence offers a wealth of new images and sources that should enrich our understanding of the early national period, it does not provide a very persuasive interpretation of the texts with which we are already familiar. For example, Declaring Independence seems unable to account for the one fact that political scientists are likely to know about oratory in the early republic, namely, that the federalists condemned demagoguery and promulgated a constitution designed to ensure that reason, rather than passion, governed political decision making. Fliegelman mentions "the Tory attack on Whig oratory as demagogical social climbing and inflammatory propaganda"; but his suggestion that this attack "failed to recognize that such propaganda rested . . . on what may be seen as a new emotive theory of representation . . . consistent with the objectives of the new oratory" does not explain why (or what difference it makes that) once the revolution had been won, the federalists adopted the Tory position (p. 76).

The weaknesses in Fliegelman's argument stem from his apparent unwillingness to grapple with questions of cultural production. Lurking beneath the postmodern vocabulary and concerns of Declaring Independence is a rather old-fashioned brand of intellectual history. Culture seems to consist of a series of texts that share the same language and concerns. Though forewarned that "this study proceeds by associative progression rather than by the isolation of different discourses" (p. 4), the reader hardly expects to encounter a work in which the only principle of association seems to be resemblance. Fond of the dialectic and of dilemmas, of ambiguity and anxiety, Fliegelman sees tension everywhere, but, of course, the same tensions keep recurring.

Curiously, this emphasis on "internal conflict" undercuts the possibility of any genuine contestation. Symptomatic of this problem is Fliegelman's failure to distinguish between federalists and antifederalists. When, for example, Fliegelman claims that the American ideal of representation called for the construction of a legislature that would be a mirror image of the people, he quotes George Mason's critique of the Constitution of 1787 as if it were a description of the theory that governed the Constitution's design (p. 43). Maybe this is just poor research (Fliegelman cites Morgan citing Mason), but it is also the kind of mistake that is a likely artifact of a method that selects similar passages from very different kinds of texts and then juxtaposes them without analyzing the rhetorical or institutional contexts in which they occur. Such an approach systematically suppresses the possibility that the same culture (or maybe the same nation) can contain radically different conceptions of its most fundamental concepts.

Fliegelman's treatment of contemporary scholarship poses a similar problem: nothing challenges his thesis, because everything can be incorporated into it. In Letters of the Republic (1990), Michael Warner made a quite compelling argument that seems diametrically opposed to the thesis advanced in Declaring Independence. Warner contends that republican ideology was embedded in a print culture that made impersonality a norm of public political discourse. Though praising the book in a note, Fliegelman dismisses its central claim in a single paragraph, stating that Warner has overlooked the fact that print culture operated alongside the oratorical conventions Fliegelman describes. "Indeed," Fliegelman argues, "what energizes a great deal of the polemical prose of the period is the dialectical relation between the authority of impersonality . . . and the authority of

sincerity" (p. 129).

This book would be considerably more powerful if Fliegelman were as sensitive to the differences between discourses as he is to the similarities across them. Both Richard Brown's Knowledge Is Power (1989) and Cathy Davidson's Revolution and the Word (1986) suggest that there was more than one way of constituting authority in the early republic and that each kind of authority had its own audience, logic, and institutions. Brown shows how, in the course of the revolution, lawyers came to eclipse ministers as the official spokesmen for their communities. Davidson discusses how both political leaders and clergy thought that the rise of the novel threatened to undermine their authority. At stake in acknowledging the contestation between discourses is not simply a preference for conflict over consensus but the difference between a static and a dynamic conception of culture. When culture is conceived of as something that leaves the same imprint on all of the artifacts of a particular era, the only ways to conceptualize change are as revolution or degeneracy. Fliegelman opens on the first note and closes on the second. By the end of his narrative, the "quest to find a voice and visual self-presentation that are true to nature, society, nation, and self has become . . . little more than an existential confidence game" and the bottom floor of the house in which Jefferson drafted the Declaration of Independence has become a clothing store whose handbills proclaim every American's right to "Life, Liberty and Genteel Garments" (pp. 196, 200).

Johns Hopkins University

SUZETTE HEMBERGER

Facing the Bureaucracy: Living and Dying in a Public Agency. By Gerald Garvey. San Francisco: Jossey-Bass, 1993. 252 p. \$23.95.

Inside NASA: High Technology and Organizational Change in the U.S. Space Program. By Howard E. McCurdy. Baltimore: Johns Hopkins University Press, 1993. 215p. \$32.95.

These two very good books use the theme of the organizational life cycle as a point of departure for the analysis of two organizations, the Federal Energy Regulatory Commission (FERC) and the National Aeronautics and Space Agency (NASA). Each story is anchored in a theoretical theme: bureaucracies lose resilience as they age; controls from the top are imposed in response to the loss of resilience; the new controls cause new transactions costs in the work of the organization and impair effectiveness; aging is only one reason for the loss of resilience; reform efforts to reduce controls and yet ensure accountability are difficult and uncertain in their effectiveness.

Garvey tells the story of the birth, life, and death of a project in the FERC to computerize and automate the system of rate making for the natural gas industry. He was a consultant to the project and writes from a participant observer stance. He posits that the "old theory" of public administration invented by the Progressives, which sees bureaucracy as efficient and politically accountable, is unable to explain the discoveries of the "new theory" about adverse selection, moral hazard, and the use and misuse of discretion. The chairman of the FERC was concerned about the even-handedness of a decentralized regulatory process that rested on bargaining between rate makers and private firms. Garvey was appointed a consultant through a bureaucratic end run that was later challenged. The process of reform worked initially, because an experienced administrator appointed a task force of computer consultants and key rate makers, which, over time, developed a new system to simplify the work of rate setting and make it more uniform yet permit discretion on the part of individual regulators. A consensus on the new standards was reached, but the achieved plan was only a half-way house toward a comprehensive system. Then an internal investigation of the project arose out of a feud among top agency officials, the method of Garvey's appointment was challenged, the appointment was invalidated, and the computerization project was killed by agency administrators worried about a more extensive inquiry.

Garvey draws practical lessons from the story. Organizational entrepreneurs can initiate directed changes against the natural changes that institutional aging brings. The key to success is public managers with political sense who understand effective strategies of organizational reform guided by prudence. Reform of this kind must take advantage of the unfulfilled personal aspirations of civil servants if it is to work; that is, the slack found in such aspiration is the best basis for helping people to do their jobs better through reform. He finds the "old theory" of public administration a better guide to action here than the "new theory," which sees bureaucracy as permeated by "self-regarding" motives. Old theorists understand the importance of organizational culture, to which new theorists are blind. Garvey sees the naïveté of both the old and new theories and seeks to combine the idealism of the old

and the tough-mindedness of the new in a thesis about prudential leadership.

Garvey does a good job of making a case study theoretically pertinent. The story is a bit slow, perhaps because it is not inherently interesting, and the participant-observor stance is one person's view of events. The ultimate normative issues are not resolved, but the book will contribute to the development of theory about organizational renewal.

McCurdy describes the origins of NASA out of agencies-charged with research-and-development for aeronautics in the interwar period. These agencies and the founding NASA created an organizational culture that gave highest value to in-house research-and-development, testing of products through hands-on engineering, and tolerance of failure through high-risk strategies—in short, a paradise for innovative engineers. The combination of youthful talent, a supportive political environment, and the historical opportunity to invent exciting technology fostered an agency that valued inquiry, open communication, attention to detail, honesty, idealism, and romance.

But after the excitement of putting men on the moon, public interest waned, political support declined, and the NASA became an operating agency, offering less challenge to its engineers and more opportunities for outside contractors. Centralized bureaucracy became stronger, and the culture of technical inventiveness eroded. Congressional oversight increased, White House control was heightened, the regulatory ethos of government grew oppressive, and bureaucratization burgeoned. Administration won out over technical invention, the dependence upon contractors increased, and the capacity to oversee them declined. The decline of in-house testing of products made the punishment of failure even worse because of limited public sympathy. The communications failures seen in the Challenger explosion and the Hubble Space Telescope mishap were manifestations of an organization that had lost the "taut communication" of the old NASA.

McCurdy concludes that high-performance bureaucratic cultures are inherently unstable. Once a governmental agency matures, the political environment that had supported its dynamism has disappeared. The most successful science and technology programs have been able to circumvent the surveillance that controls most bureaucracies. The Manhattan Project, Tennessee Valley Authority, (TVA) and other such agencies cannot be sustained in the normal bureaucratic mainstream. And once on the decline, it is very difficult to put new wine in old bottles.

McCurdy's research effort was extraordinarily comprehensive, relying greatly on interviews and surveys. Had he written a longer book, we would have a richer sense of the changing bureaucratic culture. Many of his descriptions of professional and subagency perspectives are redundant. Above all, I wish that he had given us a portrait of successive NASA leaders so that we might assess their contributions to the growth and decline of the organizational culture. As he presents it the NASA is virtually leaderless. But again, this book is a strong contribution to the theory that will emerge in time.

The two books together pose a number of important theoretical insights. First, the aging of an institution is important not in itself but for its actions and reactions. The completion of the initial missions stated by the founding charter, a changing political environment, and new generations of leaders all combine to explain the cycle of rigidity and control. Life-cycle theory is thus useful for students of bureaucracy not as a teleology but as a source of insights of opportunities and constraints on action at different times of an organization's history.

Second, politics and the pressures of politicians make it hard to keep agencies lean and innovative. Politicians will pile on encumbrances for reasons of their own often having little to do with the work of the agency. This seems to be especially true after an agency has passed its peak creativity. Incorporation into the bureaucratic mainstream effectively kills its spirit. But perhaps that is what should happen if the heroic mission has been completed.

Third, agency inventiveness and autonomy go together. The insulation from politics is the key to success. Political accountability engenders bureaucratic timidity; but again, perhaps this is appropriate if the initial agency autonomy was empowered by popular politics, as was the case with the NASA.

The systematic comparison of organizational stories like these within a life-cycle framework might permit the development of rich theory about diverging patterns in institutional history. Organizations can become stagnant like the NASA, discredit themselves by trying to stay heroic like the TVA, engage in prudent reform like the FERC, or engage in widespread organizational renewal like the General Accounting Office in recent years. Such a theory would permit us to assess the relative importance of leadership, organizational culture, and changing environments in understanding which of these paths is taken.

We also do not have sufficient prescriptions for combining bureaucratic resilience with political accountability. The two brands of "institutionalism" in political science carry different messages: the one relies on culture and norms and the other looks to mechanisms powered by self-interest. Is there a third theory that might incorporate the partial insights of the other two?

ERWIN C. HARGROVE

Latino Voices: Mexican, Puerto Rican, and Cuban Perspectives on American Politics. By Rodolfo O. de la Garza, Louis DeSipio, F. Chris Garcia, John Garcia, and Angelo Falcon. Boulder: Westview, 1992. 232p. \$29.95 paper.

\$29.95 paper.

LULAC: The Evolution of a Mexican American Political

Organization. By Benjamin Marquez. Austin: University of Texas Press, 1993. 141p. \$25.00 cloth, \$11.95 paper.

The past few years have seen a steady, if modest, increase in the interest in, and research on, Latinos in the U.S. political system. Not only has research increased, it has also changed somewhat in tenor and direction and has encompassed a broader range of questions and methods. Some of the earlier research on Latino politics might have been viewed, or even dismissed, in certain scholarly circles as being descriptive, impressionistic, advocacy-oriented, or otherwise out of the mainstream of political science research. The questionable accuracy of such characterizations aside, the two books under review here can hardly be criticized on those grounds. Both are quite conventional in their concerns and approaches and are certainly rigorous,

serious scholarly undertakings. And both volumes represent "firsts." Latino Voices summarizes findings from the first large national survey of Latinos, political attitudes and beliefs. LULAC is the first book-length study to chronicle the rise and development of the League of United Latin American Citizens, a major Latino interest group, and the first work to apply Olson's "incentive theory" to such a group. Moreover, both books provide important—and sometimes surprising—insights about Latino mass attitudes, behavior, orientations, and interest groups.

These two books, in themselves and in what they promise for the future, are likely to be seen as key pieces in the puzzle of research on Latino politics. At the same time, their methods, findings, and conclusions evidence the complexity and ambiguity inherent in seeking to understand Latino politics. The similarities noted, the two books are different, partly due to substantive interest and partly due to methods. Latino Voices is a broadbrush treatment with a contemporary, survey data focus; the Marquez book is an in-depth, historically oriented, archivally based study. The former is consciously "pan ethnic"; the latter addresses (only) a Mexican–American organization.

Latino Voices provides an overview of findings from the Latino National Political Survey (LNPS), a survey of over 2,800 Latinos and 456 non-Hispanic whites (Anglos) conducted in 1989–90. The LNPS was modeled after—and, in fact, borrows many questions from—other major political surveys, such as the National Election Studies and NORC. Following an introductory chapter outlining the study's foci and survey methodology are eight substantive chapters with 172 tables on the Latino citizen population and one chapter with 86 tables on the noncitizen Latino population (One appendix includes the entire questionnaire.)

The goals of this volume are, as the authors explain, "modest: to provide basic information about the political values, attitudes, and behaviors of the Mexican-, Puerto Rican-, and Cuban-origin populations in the United States" (p. 1). As basic as those goals may appear, they are important in that previous general political surveys have included too few Latinos to provide reliable information. Moreover, the broad array of questions posed and the delineation of responses by specific nationality groups (including Anglos) produce a rich survey. Because the goals of this work are modest, however, the authors provide relatively brief narrative to highlight evidence in the many tables. Papers authored collectively and individually by the team of scholars involved in this research have already supplied more detailed assessments and "future volumes will thoroughly analyze" the LNPS's results (pp. 1, 6).

What are some of the more notable findings? Apart from the finding that "these [Latino] groups defy simple categorization" politically (p. 15), I suspect that readers' reactions to the data will depend on their expectations and previous knowledge of Latino politics. For several forms of nonelectoral political participation (e.g., attending rallies, volunteering for political parties, attending school board meetings), Latinos are about as likely to participate as Anglos (p. 120). This, too, is in the absence of controls for socioeconomic background; appropriately adjusted, Latino participation in these areas might equal or exceed that of Anglos. Second, the self-professed political ideology of Latinos, "regardless of national origin, was moderate to conservative" (p. 83).

Recognizing the summary nature of this work, several criticisms can be noted, nonetheless. First, while a vast array of data are presented, the tables provide only percentages. Presentation of simple summary statistics (means, medians, standard deviations) would have aided tremendously in making sense of the large and complex body of evidence. Second, many tables provide useful comparisons between the Latino groups and Anglos. However, it is not always clear why Latinoversus-Anglo comparisons are presented in some instances but not others. In some circumstances, the logic of the question indicates why such comparisons would make little sense; in other instances, that is not the case.

In LULAC, Marquez deftly portrays the history, goals, thinking, and struggles of LULAC, using archival data (group newsletters and members' personal correspondence) and interviews with group members as primary sources. Incentive theory, as developed by Mancur Olson and others, is employed to frame—and thus make sense of—the group's rise and change. Created in the late 1920s in Texas, LULAC began with "purposive and expressive" goals aimed at achieving equal opportunity—goals that ostensibly were often accomplished through litigation in state courts. LULAC underwent a second burst of "mobilization" after World War II but has been changing and, over time, has come to face a "politics of survival."

The book's "central thesis" is that LULAC's longevity has been due to "the organization's ability to effectively adjust its incentive structure during the late 1960s and early 1970s. This change in the incentive structure transformed the organization from an activist civil rights group to a staff- or elite-dominated group that would devote much of its energies to continuity and survival" (p. 7). That survival has come with significant costs to LULAC's role as a serious political actor; heavy reliance on outside funding, including governmental and foundation support, has rendered it politically irrelevant.

Despite its absorbing and systematic discussion, various questions might be raised about this study. Marquez seems to assume (perhaps too readily) that because LULAC developed along a path consistent with what incentive theory would predict, the theory is therefore (fully) supported. It may be that LULAC developed as that theory generally predicts, although there are some "deviations" from the predicted pattern noted in the book. More significantly, LULAC's development might be equally well understood with other theories or explanations, but incentive theory is the only explanation considered. I should like to have seen clearer, more definitive evidence to corroborate the accomplishments attributed to LULAC; as it stands, those accomplishments are more asserted than solidly supported.

Finally, a more extended treatment of the theoretical implications of this study would have been helpful. These concerns are hinted at (but only hinted at) in an all-too-brief (six-page) concluding chapter. I should like to have had Marquez's thoughts on various questions: What does the present state of LULAC, as well as that of other mainstream Mexican American interest groups, mean for Mexican American politics? For (broader) Latino politics? For interest group politics? How critical is the survival crisis facing LULAC in the bigger picture of Mexican-American/Latino politics, given the disadvantaged political and social status of the Latino population? What might all this mean for the contemporary state and future development of U.S. liberal/pluralist democracy?

These and related questions should be among the central ones shaping the Latino politics research agenda in the near future. The work of Marquez, as manifested in the present work and as it will (hopefully) be broadened and extended can offer one useful perspective on these questions. The LNPS has initiated another approach to these issues and promises to speak fruitfully to these concerns from another angle. Diverse approaches are not only desirable but necessary, given the complex and ambiguous nature of Latino politics that these two books and most research on Latino politics demonstrate. What is most important to recognize is that larger theoretical and normative questions should guide the inquiry and that approaches are secondary.

RODNEY E. HERO

The Hollow Core: Private Interests in National Policy Making. By John P. Heinz, Edward O. Laumann, Robert L. Nelson, and Robert H. Salisbury. Cambridge: Harvard University Press, 1993. 450p. \$39.95.

It has been said that the study of pressure politics in America is characterized by a surfeit of theory and a paucity of data. In this important volume, a distinguished set of coauthors who hail from the relevant disciplines of law, sociology, and political science use what is unambiguously the richest and most comprehensive body of systematic data about *Washington representatives* (advocates for organized interests in national politics) to remedy that circumstance.

The remarkable data base underlying this inquiry consists of hundreds of interviews with Washington representatives, individuals in the organizations that hire Washington representatives, and elected and appointed government officials. The samples represent something of a "stratified snowball." The authors plumbed several sources to compile lists of organizations and individuals involved in four policy domains: agriculture, energy, health, and labor. By selecting respondents from these lists with probabilities proportional to the number of mentions, they generated, instead of a random sample, a sample that overrepresents active and influential individuals and organizations. A major portion of the book is devoted to establishing who these Washington representatives are—their backgrounds and careers, the organizations they work for, and the breadth of their policy concerns.

The heart of the book (and the section that explains its cryptic title) consists of a series of smallest-space analyses that carefully chart who knows, talks to, and fights with whom in each of the policy domains. It is here that the research strategy of concentrating on only a limited number of policy arenas pays off, for the detailed examination of the patterns of relationship would have been impossible with the more scattershot set of organizations inevitably captured when all policy domains are sampled. The communications networks and the structures of conflict and cooperation vary with the policy domain. However, in no domain do the authors find a small, cohesive elite playing either a dominating or mediating role at the center. Rather than a wheel with a hub and spokes, the networks of communication among influentials resemble a soap bubble, with an empty center and a thin surface—hence, the "hollow core." In short, the authors have developed a powerful methodology that takes us beyond the obsolete notion of the iron triangle and lends precision to Heclo's notion of the porous but diffuse policy network. This methodology could be applied to policy domains ranging from civil rights to foreign policy to taxation (domains presumably characterized by quite different patterns from those examined here) to provide a detailed map of the configuration of organized interests in national politics.

In the final part of the analysis, the authors confront, in a systematic way, the knottiest problem facing analysts of pressure politics, assessing whether and under what circumstances organized interests influence policy outcomes. Because it is more difficult to sample controversies than organizations, recent survey-based studies have told us much more about which organizations are active in national politics, what they do, and whom they represent than whether they have clout. In each policy domain, the authors located 20 major policy controversies and asked respondents several questions about each controversy, including how successful the organization was in realizing its goals. With admirable candor, the authors admit that their multivariate analysis (using such intuitively relevant variables as the number of years the respondent spent in government or the number of professionals employed by the organization) predicts surprisingly little about organizational success in achieving its policy objectives. From this they conclude that the hallmark of policy controversy in national politics is the uncertainty of the outcome.

The authors may give up too soon. They are aware of some of the potential pitfalls: a better measure of success might have incorporated the results of analysis of decision making in addition to the self-assessments of success by respondents. Other variables (esp. more and better measures of, e.g., organizational budget and the size of its PAC) might have been introduced into the equations. More importantly, however, the authors take insufficient account of the problems intrinsic to their methodology and the extent to which their original sample design exacerbates those problems. We must recall that the organizations examined have undergone several processes of selection, including the authors decision to oversample the active and influential. Thus, the authors' real finding is that when active, powerful organizations get to the table to settle a relatively important issue, the variables that might have been expected to make a difference seem not to matter. Had the sample included not just the big fish but the little fish whose efforts in Washington go unnoticed, the minnows that cannot even establish a presence in Washington, and the latent interests that never even hatch into organizations, then the authors might have found many factors that affect who wins and loses in Washington. This suggests, by the way, that students of pressure politics must not neglect two objects of inquiry that the authors of this study know they cannot pursue: how issues are placed onto (or kept off of) the policy agenda and what sort of organizations come into existence and are able to establish a substantial presence in national politics.

That the index to this volume contains more references to Talcott Parsons than to David Truman says a great deal about its place in the substantial literature on organized interests: this collaborative study owes more to sociology than to political science. This is manifest in superficial ways. For example, the authors display none of the relish—seemingly universal among political scientists who study organized interests in Washington—

for colorful details and illustrative stories about particular organizations and particular disputes. Furthermore, many of the empirical findings in this relentlessly datadriven book must come as no surprise to readers familiar with the Washington scene (e.g., that Washington representatives talk to their friends and not to their enemies or that what they know counts for more than whom they know). However, it would be unjust to criticize the authors for using an expensive study and a sophisticated statistical apparatus to tell us what we already knew. That systematic data often disconfirm what we know from anecdotes or personal experience is especially important in a realm as rife with misleading stereotypes as Washington pressure politics.

The sociological roots of this study are evident in fundamental ways, as well. Its pathbreaking contribution—the development and application of techniques to permit the mapping of the networks of communication and patterns of conflict and cooperation in the realm of pressure politics—derives its inspiration from sociology. In contrast, several topics typically treated by political scientists do not figure importantly: we hear little, for example, about the constituencies of organizations, the constraints they impose and their role as a resource in confronting policymakers; about elections and the place of political action committees in organizational strategies; about the substance of what has become a series of marketlike exchanges between Washington representatives and public officials, each of whom controls important kinds of political capital. Finally, although the authors refer in passing to the abundant theories generated by political scientists to understand pressure politics, their study does not pay consistent attention to a series of questions about which students of democracy have been known to obsess: Who governs, how, and on whose behalf?

Boston College

Kay Lehman Schlozman

Redefining the First Freedom: The Supreme Court and the Consolidation of State Power, 1980–1990. By Gregg Ivers. New Brunswick: Transaction Publishers, 1992. 248p. \$32.95.

Religious deviance is one of the leading rationales human beings have given for depriving each other of fundamental rights. For worshipping the wrong deity or rock—or for worshipping the right deity or rock in the wrong way-people have been killed, tortured, and imprisoned. Religious minorities who avoid these fates are often treated as second class citizens in their homeland. State laws privilege dominant faith communities by teaching religious doctrine in schools, placing religious symbols on private property, using tax revenue to pay sectarian expenses and refusing to make exceptions when seemingly neutral secular policies place severe and unnecessary burdens on politically powerless religious communities. Given the numerous obstacles religious minorities face in many parts of the world, the recognition of the right to freedom of religion remains a precious and fragile achievement.

Ivers believes that this precious freedom is presently under assault in the United States. His *Redefining the First Freedom* correctly notes that "church-state separation and religious freedom are not privileged occupants in the contemporary [Supreme] Court's constellation of

constitutional values" (p. 2). Conservative politicians and justices, Ivers insists, have already "emasculated the law of religious free exercise" and are a vote short of "render[ing] the establishment clause toothless" (p. 2). Unless new appointments dramatically change the recent direction of judicial policymaking, Ivers fears we may again return to a state where "majoritarian religious values" dominate the "civic culture," "exclud[ing] the needs and interests of religious minorities" (pp. 2–3). Redefining the First Freedom clearly demonstrates that

the Supreme Court during the 1980s narrowed the scope of both the establishment and free exercise clauses of the Bill of Rights. In cases concerning public aid to parochial schools, religious access to public schools and religious symbols on private property, a court remade by Ronald Reagan and George Bush was consistently supportive of popular majorities that wished to infuse public life with more religious values. The court's "highly deferential posture toward majoritarian decision making" was particularly egregious in Bowen v. Kendrick (1988) when the justices sustained provisions of the Adolescent Family Life Act (p. 84). That unfortunate measure offered direct federal grants to religious groups that study and respond to problems of teenage sexuality. The only serious flaw in Ivers doctrine analysis is his tendency to claim that decisions that permit government to "accommodate" religious practices require government to do so. Thus, although the Court has found the Equal Access Act constitutional, the justices have not argued that in absence of such legislation local communities would be constitutionally obligated to permit religious organizations to use school buildings for meetings.

Although Supreme Court policymaking is the primary focus of Redefining the First Freedom, that work makes several important observations about lower federal courts and interest groups. The Court's tendency to avoid clear statements of constitutional principle in many First Amendment cases, Ivers documents, has left lower federal courts with little guidance on such matters as how many secular symbols it takes to make constitutional a state-sponsored crèche in a public place. Ivers's examination of religious groups' involvement in recent cases refutes the too common claim that persons who oppose school prayer or aid to parochial schools are somehow hostile to religion. As he clearly shows, many religious organizations, Jewish and liberal protestant groups in particular, have fought hard over the past 20 years to maintain against political and judicial efforts to lower the wall of separation between church and state (pp. 7, 107).

Indeed, significant religious opposition to the recent direction of judicial policymaking partially undermines Ivers's claim that the justices have tolerated the infusion of majoritarian religious values into the civic culture. The mainstream Protestant ministries represented by the National Counsel of Churches have historically wielded far more political influence than the evangelical groups that *Redefining the First Freedom* sees as the Court's most influential supporters. Rather than understanding the Moral Majority as representing popular majorities, a more sophisticated treatment of interest group politics might understand that coalition as a large faction that supported Republican economic policies during the 1980s in return for some support of its religious agenda.

Ivers does not adequately analyze the more general constitutional principles that might explain why the

Rehnquist Court has given more sanction to religious expression in public life. For the most part, he explains recent judicial practice as part of the reflexive judicial habit of supporting the government against claims of individual right (pp. 139-40, 173). The same Rehnquist Court justices who have done the most to limit the scope of the establishment and free exercise clauses, however, have also limited state power to pass affirmative action programs, restrict campaign spending, and take property without compensation. Hence, one might want to know why conservative justices are so eager to limit the scope of some constitutional freedoms while expanding the scope of others. Ivers might also have speculated why Justice Scalia's libertarian strand, which is so evident in flag burning and drug testing cases, suddenly deserts him when he considers the free exercise clause.

Although often thoughtful and challenging, Redefining the First Freedom has the feel of an extended ACLU fundraising letter. With rare exception, opinions that deny establishment clause claims are described as "blind," "indefensible and unprincipled," "illogical," "analytically bogus," "reactionary," "crabbed and misconceived," "scandalous" and "utterly indefensible" (pp. 71, 105, 107, 108, 117, 134, 148, 153). Moreover, each defeat is described as "disastrous" or "tragic," as if allowing a crèche to be placed on the town green or a moment of silence before class is the first step in a process that will eventually bring back the Inquisition (pp. 134, 173). Ivers's concern that if the Supreme Court permits "religious devotionals during ceremonial occasions, . . . will the establishment clause still have a role in securing religious freedom for . . . anyone at all" lacks any historical perspective (p. 53). The First Amendment may forbid any governmental act that directly helps a particular religion or religion in general, but Ivers is wrong when he claims that adoption of Justice Kennedy's coercion standard "would gut the core of the Establishment Clause" (p. 114). As religious dissenters in the former Soviet Union and Iraq will attest, a non-coercion requirement is the heart of religious freedom. Judicial decisions permitting too much accommodation of religion may violate the First Amendment, but religious freedom in the United States will not disappear if communities are allowed to place cheap crèches on public squares during the holiday season.

University of Maryland, College Park MARK A. GRABER

Sharing Power: Public Governance and Private Markets. By Donald F. Kettl. Washington: Brookings Institution, 1993. 232p. \$22.95.

Sharing Power, by Donald F. Kettl, stands in a lengthening line of recent works on the relationship of public governments to private markets in the provision, production, and delivery of traditional public services. Kettl's work is not, however, a primer on how to share power between the two. Through a description and analysis of five "case studies." Kettl identifies some of the fundamental forces in government and in the market that make the sharing of power complex and difficult, if not impossible. Specifically, he challenges the current and popular rhetoric that declares that greater reliance on the market—what he calls the competition prescription—is the solution to many public problems. While he categorically states that his work in neither an attack on nor

a defense of the competition prescription (p. 6), he argues that market and government imperfections create uncertainties that may cause the competition prescription merly to shift problems or to create more problems than it resolves. He further argues that government has a diminished capacity to manage shared power with the market. Sharing Power thus provides a cautionary note to the too easy acceptance of public governance' relying on the market and attempts to identify what is required of government and, indirectly, of the market in order for shared power to work.

As Kettl correctly notes in the first chapter, the sharing of power between public governments and the private market in the United States is not a new phenomenon. However, the historical record documents an ebb and flow in our tendency to place our hopes and faith in one or the other. Accordingly, we adopt a consensus or reliance, or (in the terms of Yehezkel Dror's Public Policymaking Reexamined, 1968) a metapolicy, that is, a policy about policies that shape reliance. In Kettl's terms, we change principal agents. Before the Great Depression our metapolicy of shared power was one of reliance on the market. Following the Depression and World War II and for the subsequent three decades, the metapolicy of the United States was one of substantial reliance on the public sector for the addressing and solving of many public problems. In the 1980s, in the United States and around the world, the perceived overreliance on, and cost of, public governance initiated the current era of heightened interest in market solutions to public problems. Government became the problem, not the solution.

In the United States, the current shared-power movement has been fueled by the convergence of three major and often ideologically incompatible forces and has taken multiple forms. The three major forces are (1) the generally antigovernment position touted by the Heritage Foundation, public choice economics, and even the 1988 Report of the President's Commission on Privatization; (2) government reformers seeking a better way to "do government"; and (3) the pragmatist attempt to address the problem of how to balance the budget in the context of great opposition to higher taxes. The forms of shared power range from contracts, grants, and vouchers to tax expenditures and denationalization. The labels include privatization, public-private partnerships, third-party government, and Kettl's government by proxy (see his 1988 book of that title), among others.

Kettl enters this complex arena to examine what this growing reliance on the market means in terms of how well public governments can manage partnerships in which they share power with the market. He concludes that government has not managed shared power very well and notes the irony in the many cases of shared power that have resulted in waste, fraud, abuse, and criminal activity on the part of the private-market participants. Kettl makes the case that shared power does not so much reduce the size of government as change the role of government from a deliverer of services to a manager of private-market service delivers. Based on the case studies, he concludes that the competition prescription fails because the overall problems of government are due to uncertainties and imperfections in government and in the market, not to lack of competition. He further concludes that even where shared power can work, government is not equipped to play the required shared-power management role. In the final chapters of this work, Kettl offers nine propositions that define the uncertainties in the relationship of government as buyer and market as seller and attempts to provide a prescription for how government can become a smart buyer of private-market goods and services and how government can become an effective manager.

Kettl is not the first to recognize the complex managing and governing relationships between public governments and private markets. Charles E. Lindblom's Politics and Markets (1977) argues that the market holds government prisoner and is thus an unequal partner. The National Academy of Public Administration's Privatization: The Challenge to Public Management (1989) concluded that privatization changes the practice of government and called for training and education of public administrators to manage shared power. And Heilman and Johnson's Politics and Economics of Privatization (1992) documented the complex relationships that exist in water-quality privatization and concluded that successful privatization would depend on the quality of the governmental and private-market contractual and management relationships. However, the study concluded that in no case should government relinquish the provision of an essential public service and a matter of governmental sovereignty (as Kettl notes). What government can relinquish or share is the production and delivery of a service. It is in these functions that a smart buyer and a capable manager become critical.

While Kettl more than once professes neutrality on the question of the inherent soundness of the competition prescription, Sharing Power is, in fact, a broadscale challenge to indiscriminate reliance of government on the market. The reader might wish for more help in sorting out the options. The organizing concept of shared power is not well defined, and the varying forms (e.g., contracting, privatization, partnerships) are used interchangeably. They are not interchangeable. Some forms challenge the sovereignty of the state, while others do not. One can be neutral on some forms and not on others. Second, Kettl's prescriptions are both too much and too little. They are too little, in that we know that effective government managers must be hired, trained, and rewarded. I would add that before hiring, they must be educated in public administration programs that teach democratic theory and public-private policy and administration. The prescriptions are too much, in that they identify the key elements needed to make shared power work-namely, to lower the rhetoric and implement the prescriptions through strong leadershipwithout providing a clue as to how to achieve either of these. I suspect, in fact, that Kettl's work might well raise, rather than lower, the rhetoric.

Nevertheless, Sharing Power addresses the important issues of shared power between public governments and private markets. At its core, this is a book about democratic theory—about what governments and markets can and cannot do. Kettl recognizes the fundamental differences between the dynamic of government and the dynamic of the market and explores what is required in order for them to share power. Anyone standing in the stream of the ongoing movement toward greater government reliance on the market (and that includes citizen, practitioner, and academic) would do well to read Sharing Power. Kettl sets the correct and relevant agenda.

Auburn University

GERALD W. JOHNSON

The Market Experience. By Robert E. Lane. New York: Cambridge University Press, 1991. 630p. \$65.00 cloth, \$24.95 paper.

Robert Lane was "blindsided in the 1960s by the counterculture" and spent the next 25 years coming to terms with it (p. vii). As a result, he has produced a book that could do more to revolutionize Western civilization than anything produced by the counterculturalists. He argues not simply that markets are bad or socialism good but that all of our standard criteria for judging the market are wrong. We should not evaluate the market on the terms upon which both its supporters and opponents agree, namely, whether it does or does not provide economic well-being through the production and distribution of goods. Rather, we should evaluate it on precisely the terms that the counterculturalists struggled (mostly unsuccessfully) to enunciate, namely, whether it enhances life satisfaction and human development through the processes of working, creating, interacting, and desiring.

Lane has not been completely converted. No counter-culturalist would agree that as between "relations with others" and work, the latter is "the major source of adult development" (p. 5). Nevertheless, his book rings with affirmations of the need for self-esteem, personal growth, and mutually satisfying relations. Similarly, no counterculturalist would turn, as Lane does, to the most rigorous experiments in cognitive psychology for evidence about human development. Still, he uses this evidence to judge markets according to the criterion that "the value of persons is as great as the value of commodities" (p. 7). Tom Hayden and Herbert Marcuse, move over!

In all seriousness, this is an extraordinary book in many ways. First, the sweep of its claims is breathtakingly broad and important: they will indeed revolutionize social science and social policy if given the attention they deserve. Second, an array of detailed analyses of social science literatures is brought to bear on the question of what actually happens as people experience the market. Lane analyzes hundreds of psychological experiments, opinion surveys, social theories, and philosophical treatises in the work of examining topics ranging from the meaning of rationality to the meaning of happiness, from the social role of money to the possibility of friendship. His ability to link these narrowly focused studies of particular locales to sweeping generalizations about human nature—and to do so mostly persuasively—is yet another extraordinary feature of The Market Experience.

It is surprisingly hard to summarize the flow of the narrative—as witnessed by the fact that the introduction lays out several lines of argument, none of which bear much resemblance to the actual order of the chapters. Lane explains why the book is not "linear" and is "reflexive," and his reasons both accurately describe and convincingly support his own project. Roughly speaking, The Market Experience begins with broad discussions of the meaning of "human capital" and of the importance of recognizing the interrelatedness of all forms of social engagement. It moves into analyses of useful and misleading ways of understanding the meaning of rationality and emotions and argues for the value of "cognitive complexity" as a substitute for rationality as a mark of human development. It then further elucidates the idea of human development by analyzing self-attribution (what political scientists more commonly call efficacy) and self-esteem. It moves at that point from individual traits to relational issues of friendship, market exchange, and the social meaning of work. From there, The Market Experience criticizes conventional treatments of money (the presumed reward of undesired work) and reformulates the real rewards of work (intrinsic satisfaction at a creative job well done, which might incidentally bring in some money). By this point, Lane is ready to analyze the meaning of happiness and the role of markets in producing it. He concludes with a brief sketch of the "elements of culture and society that promote and retard . . . economic reforms." A long, winding, and rewarding journey, with perhaps not a clear enough end.

Throughout the book, Lane refuses either to condemn or praise markets in simple terms. They are good at producing self-attributions (which are emotionally desirable even if empirically mistaken); they are misused to equate happiness with more money (above a certain level of well-being); their relation to self-esteem is complex. In general, markets do better at things they are not designed for (creating meaningful work and mutually satisfying interactions) than at things they are designed for (inducing people to work hard at hated jobs for monetary rewards). Over and over, Lane surprises with his iconoclasm and provokes with his cool, idiosyncratic, and well-defended assessments.

I cannot conclude without mentioning the most extraordinary element of The Market Experience (for political scientists, at least). Politics is almost totally absent from it. Lane hardly mentions the role of political institutions in shaping markets or in choosing among alternative systems of production and distribution. He barely refers to the role of markets in determining who gets political power or what people with political power can do in a given society. "Politics" appears once in the index, power" twice, and "government" four times—this in a book crammed with a discussion of almost every conceivable form of human interaction. Ignoring politics was clearly a deliberate choice, and I wish Lane had told us why he made that choice. In my perhaps parochial view, the absence of any discussion of power or politics leaves a large hole in this otherwise comprehensive analysis of what markets can do or actually do and in any claim about how we should think about them. We are left with a final irony: the philosopher and economist Albert Hirschman tells us more about the interaction of politics and markets (in The Passions and the Interests) than does the political scientist Robert Lane.

Princeton University

JENNIFER L. HOCHSCHILD

Redeeming America: Piety and Politics in the New Christian Right. By Michael Lienesch. Chapel Hill: University of North Carolina Press, 1993. 322p. \$45.00 cloth, \$17.95 paper.

This book examines the political thought espoused by leaders of the Christian Right in their published work. It is a welcome addition to existing scholarship, which focuses disproportionately on the activities, rather than the thought, of the Christian Right. It is also a corrective to a voluminous literature produced in different academic disciplines, which skewers the Christian Right without much pretense of taking its viewpoints seri-

ously. Lienesch notes that the movement has often been "[viewed] as intellectually insignificant and dismissed as a moralistic abnormality" (p. 20). This book objectively probes the philosophic underpinnings of the Christian Right, expounding its worldview while also unmasking its inconsistencies and outlandish claims.

The introduction is a synopsis of the contemporary Christian Right. The reader familiar with the literature will not find much new here except for the argument that the Christian Right is more than a garden-variety social movement, because it offers a comprehensive worldview "based on beliefs and inspired by values" (p. 20). Another theme here is the periodicity of conservative religious political engagement. This discussion is informative, but others have examined the subject in greater detail—such as Ted Jelen's Political Mobilization of Religious Belief (1991) and Clyde Wilcox's God's Warriors (1992).

The next five chapters compose the heart of the book, looking at the Christian Right's political thought "in the context of a series of spheres, beginning with the self and extending outward in concentric circles to include the family, the economy, the polity, and the world (p. 21). The chapter on "self" focuses on the importance of the individual's converting to Christianity, with its concomitant political consequences. The notion of conversion explains a major division among religious conservatives between those restricting their focus to saving the individual soul and those extending the idea to redeeming a morally corrupt society. Conversion also accounts for the Christian Right's fervor: the imperfect person must constantly strive to overcome-his own sinful nature or society. This chapter draws heavily from the biographies of televangelists and probably takes their claims about their individual conversions too much at face value (but with no appreciable harm to the argument).

Chapter 2 focuses on "family," and it is a strong point of the volume. Lienesch relates the deep philosophic contradictions about gender roles. Husbands are called upon to be patriarchs but also sensitive partners; wives are to sacrifice for the sake of others but, in doing so, to exert control over familial relations (a classic case of assuming power by refusing power, à la Marbury v. Madison). Ambivalence also exists over sexuality (particularly as to whether women are temptresses or virtuous mothers), with marriage deemed a reasonable litmus test. Feminists seeking a careful rendition of the Christian Right's philosophic and pragmatic objections to their cause will find it here. In a separate vein, the author shows how parents hold conflictual attitudes toward institutions that shape the family. They attack public schools for their secular orientation, for instance, while making sure that their own children receive a sectarian, private education. The difficulty of reconciling literal Christianity with contemporary outlooks is skillfully covered in this chapter.

Chapter 3 uses the language of Reaganomics to describe views toward the economy. Christian Right leaders favor trickle-down economics because it recognizes the principle of creating more wealth to benefit all, rather than redistributing money to reward the indolent. They advocate a supply-side theology that justifies the accumulation of wealth as a reward for hard work and as recognition of God's blessing. Lienesch shows how parables are tortuously interpreted to rationalize wealth, while passages attacking the rich are glossed over. This

chapter complements work on the awkward relationship between secular and religious conservatives, found in places such as E. J. Dionne, Jr.'s Why Americans Hate Politics (1991).

Chapter 4, on the "polity," analyzes the overtly political tracts written by religious conservatives. Many of those works interpret history, arguing that America is part of a providential plan gone awry as religious conservatives have left the political arena to secularists and humanists. (Hence the need to reestablish a "moral majority.") The most peculiar aspect of the Christian Right's political thought surfaces in this context, namely, the identification of a humanist conspiracy. Lienesch demonstrates that leading figures proceed beyond the proposition that secular ideologies have grown more important into the bizarre claim that a concrete number of humanists control public affairs. He further shows how that outlook abets different orientations: "At times, [Christian Right leaders] act as a morally conservative majority, committed to reclaiming mainstream values; at others, they are a militant minority, a pragmatic group of power politicians determined to implement their own political platform; at still others, they are a radical remnant seeking to overthrow the system" (p. 171). Torn between status as a latent majority or a victimized minority, Christian Right leaders present both scenarios. More attention to the type of audience receiving each kind of message would have further strengthened this presentation.

One other dimension of this chapter will intrigue political theorists and perhaps those attuned to politics in the academy. Christian Right leaders deplore the Enlightenment for advancing the causes of secularism and humanism, with Rousseau singled out for inculcating the separation of reason and revelation, as well as laying the groundwork for the French and Russian revolutions (pp. 159, 180). This body of work supports Lienesch's earlier claim that the Christian Right is more than a modern political force: it offers a worldview, complete with people for whom Locke and Rousseau are more important than Clinton. This theme also touches upon contemporary campus politics: Is the Enlightenment the flowering of knowledge, the birth of secularism as religion, or the inflation of the views of Eurocentric white men? In an odd twist, Christian Right leaders and multiculturalists seem to converge in their mutual antipathy for the traditional interpretation of the Enlightenment.

Chapter 5 focuses on the "world," and provides an exegesis of the idea of America as a "city on a hill." It does not break new ground, however—which is also the case with the chapter's anticommunist and eschatological themes. The brief conclusion, on the other hand, provides a thoughtful summary of the movement's past and future direction. Substantive notes and a solid index round out the book.

This book should be read by scholars of the Christian Right, both for understanding and for testable hypotheses. It may also interest those teaching American political thought. Lienesch has been immersed in the published work of Christian Right leaders, and he has produced an interesting and important book.

University of Maine

MATTHEW C. MOEN

Monitoring Government: Inspectors General and the Search for Accountability. By Paul C. Light. Washington: Brookings, 1993. 274p. \$31.95 cloth, \$12.95 paper.

This book, by Paul Light, is a monograph on an institutional innovation in the federal government, namely, the centralization of auditing and investigation functions at the top level of executive branch departments and agencies, with such functions subordinated to statutorily empowered inspectors general. This institutional innovation was achieved legislatively during the late 1970s and implemented administratively during the Reagan presidency. Drawing on survey and interview data collected by Light, as well as the documentary record, Monitoring Government explicates the legislative and administrative processes through which offices of inspector general (OÎGs) throughout the federal government became well endowed and institutionally secure. The book further makes a number of evaluative claims about OIGs and provides some supporting argumentation. Beyond this, the author endorses specific modifications in the institutional design of major OIGs in order to capitalize on their legitimacy, staffing levels, and civil service ethic. The book thus provides information that will be invaluable to scholars who seek to generalize about the politics of public management, and it will serve as a point of reference in debates about both the public policy emphasis on compliance-oriented accountability and the effectiveness of OIGs as a policy instru-

The book's principal empirical generalization is that inspectors general have dedicated themselves to monitoring whether government employees, contractors, and others are complying with federal rules and regulations. In strategies reminiscent of the Federal Bureau of Investigation, many inspectors general chose to focus specifically on catching as many wrongdoers and as much wrongdoing as possible. Light explains the dual focus on compliance accountability and production of statistical accomplishments by analyzing the incentives at work in the federal political-administrative system. If OIGs' main objective was institutional autonomy vis-à-vis their respective departments, they had an incentive to please Congress and the Office of Management and Budget (OMB). Congress could grant them more autonomy by amending the Inspectors General Act; the OMB could override department-level staffing and budget decisions. Offices of inspector general were therefore rationally responsive to congressional and OMB interests. For Congress, the focus on compliance monitoring and "stats" production yielded recommendations for actions that (in comparison with rival approaches to improving accountability) were politically more palatable, jurisdictionally cleaner, less expensive, and quicker to implement. For the OMB under Reagan, outputs of compliance monitoring processes were considered evidence supporting the claim that the administration was winning the war on waste, fraud, and abuse.

A second major empirical claim is that statutory OIGs in departments and major agencies under Reagan became well endowed and relatively independent of the organizations they monitored. They had grown by almost fifteen hundred FTEs by 1986. Autonomy was enhanced by the OMB's sponsorship of inspectors general as a corporative group, allowing incumbent inspectors general across government to screen candidates for

specific posts and permitting a substantial measure of self-regulation. Inspectors general retained the statutory right and obligation to report to Congress without the content cleared by department or OMB officials. In addition, OIGs enjoyed formal and informal means to override decisions made by-and circumvent obstacles imposed by-their department's own administrative staff functions (the only major exception being mandatory reliance on centralized functions for legal advice). Mainly on this basis, the author infers that "the government seemed better equipped in 1989 to catch wrongdoing, albeit after the fact, than in 1978" (p. 221). Under Bush, the autonomy of inspectors general vis-à-vis departments was diminished by changes in both the selection process and the OMB's structure and focus. However, major establishments' OIGs remained sizable and

Light proposes three specific institutional changes intended to enhance the autonomy of inspectors general vis-à-vis departments (an appointments process modeled on the Reagan administration's, a fixed term of office, and no pay-for-performance) and one change intended to enhance OIGs' capacity to conduct investigations (a statutory provision specifically granting their investigators limited power to subpoena testimony). The author argues that OIGs ought to become a principal home for evaluators within the bureaucracy. Among the grounds for this recommendation is the prescriptive claim that they should broaden their approach to achieving accountability and the empirical claim that they have the institutional muscle to secure the needed positions and depoliticize analysis. Although the author expresses serious doubts about the desirability and feasibility of this strategy for increasing and improving evaluative work within the bureaucracy, he concludes that given the current politics of public management, the strategy is nonetheless optimal.

Perhaps ironically, readers of Monitoring Government will remain uncertain, throughout the book, what Light wants to be held accountable for. It is plain that he intended to pledge himself to demonstrate the warranted assertibility of the two descriptive generalizations about inspectors general and their offices just discussed. However, he also states that their "eventual reliance almost exclusively on compliance in their search for accountability reveals a great deal about the politics of administrative reform" (p. 12, my emphasis). Even though other administrative reforms are briefly discussed, the reader is uncertain if it is fair to evaluate the book on how well the author formulates and defends descriptive generalizations at the level of administrative reform. The same kind of uncertainty bedevils the critical consideration of evaluative generalizations about OIGs. Light states that inspectors general and their offices "provide an opportunity to examine the consequences of eight specific 'innovations' in the search for accountability (p. 2). (As revealed in subsequent lines, the statement not merely prefatory.) It is impossible to know what specific evaluative generalizations about OIGs Light proffers as warrantedly assertible (as opposed to simply plausible)—not to mention what standards of evaluative inquiry he wants the reader to accept. Uncertainty on this score is not resolved in the main body or in the notes. If the book is accountable solely for substantiating the two descriptive generalizations discussed, the research project is an evident success. The collection of

data, the culling of information, and the framing of evidence is impeccable.

It may be that the author intended to provide a definitive evaluation of the implementation of the OIG concept. However, specialists in public management and policy analysis are bound to conclude that the work merely engages evaluative questions, failing to wrestle any of them to the ground. In conceptual terms, Light appears to conflate the effectiveness of the policy of reducing waste, fraud, and abuse in government with the organizational effectiveness of OIGs. Within a given policy frame (even a misguided one), OIGs may be evaluated favorably. Light clearly wants to make the case that the policy is largely ineffective (or even perverse), because overseers have reallocated resources from such staff functions as planning and evaluation units to OIGs. This case is plausibly made. However, once a distinction between policy and organizational effectiveness is drawn, it appears that the author barely engages the second issue. Four points are relevant. First, no information or commentary is provided about the basis upon which OIGs claim to have put funds to better use as a result of their operations. Since this category greatly surpasses criminal recoveries as a source of savings, one cannot begin to know whether OIGs' major indicator of effectiveness is more than mere rhetoric. Second, no consideration is given of whether inspectors general attempted to limit the adverse consequences on agency operations of their own investigations and auditing work. Third, operating and performance standards of the "compliance industry" were not brought to bear in making inferences about organizational effectiveness. Did OIGs implement formal or informal programs to encourage auditors working on civil enforcement cases to nominate cases for criminal investigation before they became stale? How much enforcement presence (an element of deterrence) was created as the result of auditing and investigation work? How efficiently was enforcement presence created—as compared, for example, with the auditing and criminal investigation functions of revenue agencies? How well did OIGs utilize the "visible odium" of criminal convictions for deterrence purposes? Finally, taking into account valid excuses provided by institutional and personal incentives, did OIGs focus effort in ways that could reasonably be seen as maximizing economy and efficiency (however defined)? Absent plausible answers to these kinds of questions, one remains ignorant about the organizational effectiveness of OIGs.

MICHAEL BARZELAY

The Constitution and American Political Development: An Institutional Perspective. Edited by Peter F. Nardulli. Champaign: University of Illinois Press, 1992. 238p. \$39.95 cloth, \$14.95 paper.

The United States as a Developing Country: Studies in U.S. History in the Progressive Era and the 1920s. By Martin J. Sklar. New York: Cambridge University Press, 1992. 328p. \$49.95 cloth, \$14.95 paper.

These two books are fascinating contributions to the growing literature synthesizing politics and history, though each for very different reasons. Martin Sklar's *United States as a Developing Country*, is a collection of articles representing over 30 years of his work develop-

ing new perspectives about American political institutions. The panoramic view presented by one of our most provocative intellects includes his hitherto unpublished essay, "Dollar Diplomacy According to Dollar Diplomats," which dates to his Wisconsin University master's thesis in the late 1950s; articles published in the 1960s, and more recent contributions. In addition, he composed an original opening chapter especially for this volume, "Periodization and Historiography," in which he forcefully argues that U.S. society cannot be studied "without reference to its *political* history" but, rather, must be envisioned as a developing nation whose evolutionary stages reflect the common need of all industrializing societies to come to terms with the dual forces of "capitalism and socialism" (pp. 10, 36).

As we know from Sklar's influential Corporate Reconstruction of American Capitalism, 1890-1916 (1988), he explicates the underpinnings of the American state in terms of market forces defining the parameters of political development. His collection of essays is a "must read" because it provides a more complete understanding of the nuances and scope of his own development as a noted scholar of American political change. Yet despite the author's commitment to political institutions, it leaves us somewhat in the dark about how major political structures are actually connected to political evolution over time. The book's index, for example, contains no entries for "Congress," "Supreme Court," or "Presidency." Similarly, while it lists only 6 pages in reference to some form of "constitutionalism," topics related to "corporatism" get 95, and "investment," 28. While this is not surprising, given Sklar's well-known proclivities, it nonetheless presents a somewhat skewed account of the political history of American institutional develop-

To appreciate the conjunction between political structures and subsequent historical processes defining American state development, we would do well to turn to the excellent volume edited by Peter F. Nardulli, *The Constitution and American Political Development*. In an innovative enterprise, Nardulli gathered together "recognized American politics scholars" who were "not constitutional experts" (p. viii). He then asked this eminent group of nonconstitutional experts how "constitutional factors" influenced the development of Congress, the presidency, the bureaucracy, the Supreme Court, political parties, interest groups, and federalism in the context of American political history (p. viii).

The result is extraordinary. The essays are uniformly well written and informative, and they address the main theme with exceptional coherence. Taking, as a starting point, that the Constitution embodies "the external point, that the Constitution embodies "the external standards that define American ideals" (p. 15), each author analyzes the impact of constitutional provisions upon institutional components of the American political system. Superb chapters on Congress by David Brady and Charles Stewart trace with clarity and precision how partisan politics mesh with legislative structures to translate electoral preferences into legislated policies. Bert Rockman draws upon marketplace analogies to analyze insightfully the evolution of the presidency within the confines created by constitutional provisions, and Lawrence Baum and Kermit Hall provide incisive appraisals of Supreme Court activism and federalism, respectively, as vital component of public law—to cite just a few of the many fine essays in this collection.

The historical turn taken by many scholars interested

in the confluence of politics and history extends statecentered analyses of political systems and their policy outputs. Launched by new institutionalism approaches a decade or more ago, the focus on how the presence or absence of state structures influences the policy articulation and accomplishments of societal actors not only "brought the state back in" but often resulted in significant cross-national comparisons between the United States and (usually) Western European nations. While often only implicit, these analyses had, as their subtext, historical premises about American political development that the current concentration on politics and history helps to explicate.

In this context, both of these books make important contributions. Martin Sklar highlights the relationship between the economic foundations of society and its political development, even as he all but excludes such basic legacies as the constitutional arrangement of political institutions. Yet it is this omission that informs Peter Nardulli's provocative collection. Those teaching graduate proseminars, therefore, would do well to consider both works. They feature contrasting themes, which, when taken together, broaden our understanding of American political development and the diverse intellectual landscape defining its terms of debate.

EILEEN L. McDonagh

The Dynamics of Ethnic Competition and Conflict. By Susan Olzak. Stanford: Stanford University Press, 1992. 271p. \$32.50

Olzak offers an ambitious and insightful view into the workings of group conflict. Her contributions in this volume are both theoretical and empirical. She focuses her attention on the historical period from 1877 to 1914 in the United States. During this period, there were massive waves of immigration into this country, as well as internal migration. There were also periods of economic turbulence, accelerated industrialization, evolving and strained relations between races, and labor difficulties. There was violence as well, both white-on-black as well as against Asian and European immigrants. In short, this period contained a rich brew of conflict situations that makes it a perfect setting for the current study.

Olzak employs data from daily editions of the *New York Times*. She has collected a valuable body of data from a close reading of the actual newspaper articles rather than using the more limited information found in the *New York Times Index*. She identifies conflict situations from the largest 77 cities in the United States, and collects both qualitative (i.e., the type of conflict) and quantitative (i.e., how many people were involved) data for all observations. Olzak combines this information with additional social information relevant to the time period and pertinent to particular geographical regions. Her dominant empirical strategy is to use (wisely, in my view) event history analysis to unravel the major puzzles of the period.

The scope of Olzak's analyses is quite striking. She analyzes the influences of immigration and economic contraction on ethnically related events. She focuses particularly on labor unrest as it relates to violence against African-Americans. This later expands in the book to an analysis of lynchings and general urban

violence. The competition for jobs is an area that adds to her economic analyses. Finally, in a chapter co-authored by Elizabeth West, Olzak analyzes the birth and mortality of ethnic newspapers in relation to incidents of violent ethnic conflicts. Her results throughout, and particularly in the chapter on ethnic newspapers, are not always intuitive. Indeed, it is precisely because she comes up with so many logical but nonobvious conclusions that her work is so valuable.

Olzak's basic argument is that competition is the driving mechanism behind most ethnic conflict. She challenges previous theories that suggest that ethnic conflict arises from things like relative deprivation, modernization and development, and assimilation difficulties that result in threats to an existing ethnically defined balance of power. One of her primary hypotheses is that ethnic conflict arises not from the separation and relative deprivation of groups, but rather from the breakdown of the former social order that kept the groups apart. It is when groups mix that they begin to compete. Essentially, they compete for the same limited resources, and Olzak's perspective is not unlike that of a typical population biologist who sees much of the world in terms of competing species.

Olzak's arguments lead to some highly interesting observations. For example, she claims that violence against African-Americans can result when another group (i.e., not African-Americans) migrates into an area, thereby increasing the competition for jobs among white Americans. Thus, it is not necessary for the in-migrating group to experience the conflict (although that may happen initially), even though that group's activities may be the ultimate cause of the struggle. Conflict with the initial immigrants can subside while whites escalate their attacks on African-Americans. All of this is connected to the idea of competition for resources (e.g., jobs) between members of differing ethnic groups.

From an empirical perspective, Olzak makes her points using both tables and some useful plots. I find her empirical analyses to be both competently executed and creatively designed. However, one of her primary contributions is in the realm of theory. Her view is one that is rooted in time-dependent dynamics, not static social conditions, and I am certain that all scholars will find something either to praise or to contest among her many findings and conclusions. Ultimately, she is not saying that humans fight because there are injustices in the world, but rather because the injustices are in evolutionary processes of decay that cause groups to interact in new ways. To use a meteorological comparison, wind (read "conflict") occurs not because there is a high pressure area next to a low pressure area. Rather, wind begins when the ridge that separates the two pressure systems begins to break down and the air masses from the two systems begin to mix.

Some may even find that Olzak's views challenge their basic notion of human rationality in situations of collective conflict, since her perspective could be interpreted as more oriented along the lines of stimulus-response than in action based on decision-making and the availability of information. In short, Olzak has written an extremely interesting book, filled both with the intelligent analysis of data as well as theoretical conclusions that are both provocative and compelling.

The publication of *The Dynamics of Ethnic Competition* and *Conflict* serves a useful secondary purpose. Many

(but by no means all) of the results in this book have appeared in article form in a variety of settings. Olzak's prolific writings needed to be organized into a coherent thesis, and this book does this nicely. She has an interesting theory about group conflict, she argues her points effectively, and she leaves the reader with much to ponder. It is a book to be recommended to all those interested in the social structural mechanisms of volatile group interactions.

Emory University

COURTNEY BROWN

Out of Order. By Thomas E. Patterson. New York: Knopf, 1993. 301p. \$23.00.

This well-written book explores the mass media's influence in presidential elections. No previous study better documents the difference that media-dominated campaigns have made to American politics. Full of epigrammatic insights, this study combines exhaustive empirical research with trenchant normative observation. Out of Order argues that the media and especially television have replaced political parties as the chief screening agencies for presidential candidates. The results are baleful. The year 1960 was the turning point. Television news began drawing large audiences, and the parties started relying heavily upon primaries to select convention delegates. The parties abdicated much of their king-making function, the media generated more authority in the winnowing process. Simultaneously, they have increasingly portrayed presidential candidates as irredeemable liars and hypocrites.

Patterson argues convincingly that journalists fail to distinguish between trivial, politically necessary, or correctable dissembling (exaggerating opponents' liabilities, denying adultery) and lying that undermines the basis of elections. The latter occurs when candidates deliberately deceive voters as to their policy intentions. Patterson's research systematically reveals that contrary to the media's suspicions, elected candidates normally do keep their word: they pursue and often deliver the policies they promise.

According to Patterson, media coverage nonetheless assumes and conveys that essentially everything candidates say is motivated by politics. As such, journalists hold, it can safely be categorized as manipulative sloganeering. This assumption bolsters the the well-documented tendency for campaign journalism to focus on the horse race—who's ahead, who's behind, what strategies are working, what new strategies are planned. Even when reporters discuss issues, the view that candidates' positions are just part of the game plan permeates coverage. All this not only reduces the public's ability to learn about the candidates' public character, record, and policy plans, but it trains Americans in cynicism.

Among the book's most useful features is a series of tables tracing aspects of coverage from 1960 through 1992. One documents the growing analytical orientation of campaign news. No longer is a detached voice the norm. Reporters habitually air opinionated evaluations of candidates. The assessments focus not on substance but on the quality of campaign gamesmanship. The data suggest that descriptive material comprised over 90% of front-page coverage in the *New York Times* in 1960; by 1992, description accounted for under 20% and interpretation over 80%.

The historical-trend data also show that the proportion of stories framed in terms of policy has plunged from over 50% in 1960 to less than 20%, while game or horse-race coverage has risen from 45% to about 80%. During the same period, the balance of good versus bad news about candidates has shifted from 75% good in the earlier campaign to about 60% bad in 1988 and 1992.

There is always room for criticism of coding decisions: What exactly comprises good or bad news? Might the nature of good and bad news vary with candidates and campaigns? Is horse-race news not sometimes intertwined with issue coverage? But Patterson marshals much evidence supporting the basic validity of his argument. For example, in the same 1960–92 period, the proportion of the public responding unfavorably to both major party nominees has gone from about 20% to over 50%. The length of sound bites on television has shrunk markedly; and, Patterson shows, so has the length of candidate quotes in the *New York Times*. In all media, the derisive, prognosticating voice of the reporter is subsuming the policy voice of the candidates.

One specific example that Patterson cites is a report on candidate Bill Clinton's 1992 campaign speech to a labor group. A network report featured a sound bite of Clinton saying, of the North American Free Trade Agreement (NAFTA), "I'm reviewing it carefully, and when I have a definitive opinion, I will say so. It's a very long and complex document." The reporter then says: "Time out! Clinton has a reputation as a committed policy wonk who soaks up details like a sponge, but on an issue which will likely cost him votes no matter what side he takes, the onetime Rhodes scholar is a conveniently slow learner" (p. 6).

Patterson points out that the NAFTA document was 1,078 pages long and argues: "To suggest . . . that the 'policy wonk' Clinton should know every part of it and flatly accept or reject it in its entirety is disingenuous. Worse than that, it is fatuous. It assumes that having a fixed opinion on every aspect of every issue . . . displays true leadership, and that any hesitation or objection on a candidate's part is a practiced deception" (p. 16). This passage exemplifies the straightforward and lucid normative analysis that the book weaves through its empirical narrative.

The author believes that because the press filters innovative policy proposals through the cynical horse-race schema, the news often punishes candidates for talking in earnest about policy. The coverage tends to portray debate about substantive proposals as campaign-threatening controversies. A classic example was McGovern's proposed negative income tax: originated by Milton Friedman, the media treated this proposal as a gaffe, helping to stigmatize McGovern as a leftist radical. At the same time, notes Patterson, the media frequently chastize candidates for avoiding honest, original, detailed issue stands. Damned if they do and damned if they don't, candidates begin resembling the cautious beasts that the media construct.

No book is perfect. While Patterson's own contentanalytical material is enlightening, he sometimes buttresses his claims with others' questionable data. For example, he cites research claiming that only 2% of the Fall campaign coverage in 1992 focused on the "character" issue for Bill Clinton (p. 195). Others might have coded the many mentions of "family values," "trust," Gennifer Flowers, "Slick Willy," and similar phrases as oblique or direct comments on Clinton's character. The book would have been even stronger had Patterson stuck to his own research data, the most pertinent and convincing. Nevertheless, his eloquent reasoning and masses of evidence establish a compelling case. Patterson is careful not to blame individual journalists or news organizations for the state of electoral politics. He recognizes the interlocking structural causes of the malaise. He notes that journalism is only part of the problem and that the parties' decline has thrust upon the media a function they simply cannot carry out. The book's proposed remedies are, as always, debatable, but they are worth considering. If I were to recommend one book among the dozens on media and U.S. presidential elections that have appeared in recent years, this would be it.

Northwestern University

ROBERT M. ENTMAN

The Supreme Court and the Attitudinal Model. By Jeffrey A. Segal and Harold J. Spaeth. New York: Cambridge University Press, 1993. 390p. \$54.95 cloth, \$17.95 paper.

This is an important book by an important pair of scholars of the Supreme Court. It has already engendered a great deal of controversy, even among those who generally agree with the line of reasoning; and it will accordingly create even more controversy as the proponents of other approaches to the study of the Supreme Court find and read this book. Those who adopt this model as a guide to understanding the Court will swear by this book. For others who take sharp issue with it, I suspect it will become a book many will love to hate. Few who read it will come away with neutral feelings.

Segal and Spaeth take up the cudgels for what they call the attitudinal model of decision making on the Court and take direct aim at competing understandings of what motivates the justices to behave as they do. The main competitor is what they call the legal model. The attitudinal model, according to Segal and Spaeth, "holds that the Supreme Court decides disputes in light of the facts of the case vis-à-vis the ideological attitudes and values of the justices" (p. 65). By contrast, proponents of the legal model see judicial decisions as a response to the facts of a case in light of "plain meaning, intent of the framers, precedent, and balancing of societal interests" (p. 64).

So what motivates the members of the Court? Is it precedent, plain meaning, and the rest of the litany, or it is raw policy preferences? If I had to choose between the two, I would indeed take the latter. But Segal and Spaeth's views, at least initially, are extreme, with few subtleties. They really do not set up any realistic competitor to their model of decision making. I can think of no political scientists who would take plain meaning, intent of the framers, and precedent as good explanations of what the justices do in making decisions. Some political scientists and many lawyers think it would be nice if justices did follow precedent, the framers' intent, and so on; but that is another matter. If there is no position other than the attitudinal model and the silly formalism of the legal model, the debate is over. Yet no one who has taken Introduction to American Government, read Marbury v. Madison, or witnessed the fights over nominations to the Court during the Reagan and

Bush years is going to ascribe to the legal model. Thus, it is really not a worthy foe, and much of Segal and Spaeth's discussion of it is beside the point. Segal and Spaeth's real foes are the many political scientists and lawyers who would belittle the analysis of votes and say that we have to look at opinions as a whole. But, peculiarly, the authors do not make them the main target of the book.

Segal and Spaeth's formulation of the attitudinal model strikes me as too blunt. Justices, like other political actors, are not free to translate their preferences directly into policy in any and all situations. Înstead, the justices maximize their policy preference under the constraints of law, policy, and custom. Liberal justices, for example, do not grant certiorari on trivial cases simply to reverse a conservative outcome in the lower courts: they grant it on cases in which some live legal issue is present and in which some plausible case for meeting the Court's rules can be made. Of course, this is true of other political actors; and the distinctions many make among judges, legislators, and bureaucrats are exaggerated. All policymakers work within constraints; and, in this sense, judges are no different. Later in the book, Segal and Spaeth seem to take constraints into account; and, of course, they know that the justices do not simply enact their preferences. But the blunt formulation of the attitudinal model pops up again and again.

Chapters 4–7 constitute the heart of this book, the main evidence for the attitudinal model. In these chapters, Segal and Spaeth take up and present systematic evidence on staffing the Court, gatekeeping, decisions on the merits, and the distribution of opinion assignments. The evidence is plentiful and convincing.

The chapter on staffing shows how ideological considerations come into play from the very beginning, from the choice of the president all the way through the decisions of senators to vote for or against a nominee. The larger the ideological distance between a senator and a nominee, the likelier he or she will vote against a nominee. Questions about the qualifications of a nominee make a difference, but ideological distance magnifies the effect of this variable; that is, the larger the ideological distance between nominee and senator, the bigger the difference made by questions about qualifications.

the difference made by questions about qualifications. In the chapter "Getting into Court," which is largely a review of prior work, Segal and Spaeth present impressive evidence of the ideological nature of the justice's decision making. For example, a justice is substantially more likely to vote to grant certiorari who disagrees with the outcome in the lower court. For decisions on the merits in the law of search and seizure (chapter 6), Segal and Spaeth show the strong impact of ideological considerations above and beyond the factual circumstances of cases. In chapter 7 ("Opinion Assignment and Opinion Coalitions"), they offer a wealth of evidence on the impact of ideology on how the chief justice distributes opinions among his colleagues. For example, although chief justices strive for equality of workload, they tend, on average, to assign more opinions to those closer to them ideologically and fewer to those furthest from them.

I do not see how anyone can come away from these middle chapters without granting the tremendous impact of the ideological positions of the justices. "Ideology," "attitudes," "policy preferences," "single-minded seeking of policy"—whatever one wishes to label this phenomenon—pervade the decisional processes of the Supreme Court. Thus, if we take the purposiveness of

judicial behavior as the basic proposition of this book, I think the authors have succeeded.

Segal and Spaeth, in my view, try to do too many things here. To account for every facet of the Court in an empirical fashion in one book is a tall task: any one part could easily serve as the fodder for several monographs. Their insistence on full coverage—from staffing to compliance-sometimes precludes the full development of an aspect of the Court. The large number of topics makes for a distracting busyness. Then, too, some of the chapters do not fit well into a book of this kind. Segal and Spaeth set out a theoretical framework juxtaposed against the legal model and test it against several sets of data. Then, in the middle of the book, they give us a political history of the Court to show how ideological considerations have underpinned its decisions. I would be the first to sign up for the proposition that ideological considerations have, from the beginning, played an important role in the Court, but this short history proves nothing. Actually, this is the standard stuff of politicalscience reading of constitutional law going back at least to Corwin and Powell. If we were to look back at the first editions of Mason and Beaney's American Constitutional Law and Cushman's Cases on Constitutional Law, I would bet a large amount of money that we would find similar accounts of the same decisions. Similarly, in two later chapters, Segal and Spaeth go through the evidence on compliance with, and implementation of, the Court's decisions and the relationship between the Court and other actors in the political system. In chapter 9, on compliance and implementation, Segal and Spaeth review the existing evidence; in chapter 8 they present a number of descriptive tables. Neither of these chapters has much to do with proofs of the attitudinal model of judicial decision making. Perhaps the real problem is that this is both a scholarly monograph and a textbook. At least it has the components of both kinds of books.

Despite my reservations, this is a fine and important book, one I will certainly consult often. There is much to commend this book. First of all, it contains a wealth of information about the decisional processes of the Court, from the legal framework through the nitty gritty of voting, opinion assignment, and the like. Oddly, given the theoretical stance of the authors, this book is particularly strong on the legal framework of decision-making in the Court. Second, the authors adopt a clear theoretical stance. No theoretical waffling mars these pages. One may or may not agree with that stance, but it is out there, along with the data to support it; and others now have a clear target. Third, Segal and Spaeth use this book to bring together a great deal of work published in a variety of journals and to provide new data and results on a number of points. Fourth, since the Supreme Court Data Base Phase I supports most of the analyses, anyone who wishes to challenge the results or conclusions or to extend the work can easily do so with this public dataset.

GREGORY A. CALDEIRA

The Politics Presidents Make: Leadership from John Adams to George Bush. By Stephen Skowronek. Cambridge: Harvard University Press, 1993. 526p. \$29.95.

What are the determinants of presidential leadership? Why are some presidents widely considered "great,"

while others range in historical reputation from mediocre to disastrous failures? These questions have, in one way or another, been central to the literature on the presidency, some of it centering on its constitutional function, some on the getting and keeping of real-life power, and some on the psychological qualities of the men who hold the office. Quite a bit of this literature has been framed in terms of a great wall of separation between the modern presidency since 1933–45 and the (mostly irrelevant) presidencies before then.

For Stephen Skowronek, the fundamental issues are embedded in a Constitution that, unlike society and economy in the United States, (and, for that matter, unlike the empirical operations of politics) is, in its foundations, unchanging, static, timeless and "nondeveloped"—the core of what Samuel Huntington has called the American "Tudor polity." In this world of separate powers and clashing ambitions linked to "the prerogatives of the place" (as Madison put it), the issues confronting presidents go back to the very beginning and not just to 1933 or so. More than that, there is a dialectic at work: the interplay between constitutional nondevelopment and political (and other) development in the United States produces regular cycles. Regime orders come into being in the wake of a massive, crisis-laden upheaval sequence. They persist at first robustly and then, over the longer term, more and more vulnerably as intramural infighting takes its toll and the development of society and economy creates new problems and cleavages that the existing order is ill equipped to meet. Finally, each in its turn, perishes in the next punctuational-change crisis, to be replaced, out of the ruins, by the next regime order and its transformational (Skowronek: "reconstructive") leadership. Such cycles are iterated across the entire span of chronological time. This means at least two things: (1) the contexts of presidential power are anchored in "political time," and (2) presidents occupying the office in comparable moments in political time may be profitably compared with one another, even though they may be separated by decades in the passage of chronological time.

This portion of Skowronek's model in principle permits classification of American presidents from the federalist era to the present day on two dimensions: their affiliation with, or opposition to, a given regime order and the extent to which that order is robust or vulnerable. This, in turn, gives us a fourfold classification of individuals in their contextual and political-time setting that has been well known in the field since the author zpublished his famous article on in 1986. The four types of political practice are (1) reconstruction (the great regime overthrowers and builders), opposed to an acutely vulnerable order; (2) articulation, affiliated with a robust order; (3) disjunction, affiliated to a collapsing order; and (4) preemption, opposed to a robust order. In the bulk of the text, the author systematically examines presidents and their contexts of action in the first three categories, from Thomas Jefferson's reconstruction to Jimmy Carter's disjunction.

But something else is superimposed. What forms the driving force behind presidential inputs to the world they inherit and attempt to shape is, in the first place, the inherently disruptive force of the office and its equally inherent hostility to all governing arrangements existing at the time that a given president first takes office. The keynote here was given by James K. Polk: "I intend myself to be President of the United States." If, as

Skowronek says, the office is simultaneously ordershattering, order-affirming, and order-creating in its properties, even weak incumbents tend to create significant disruption as they seek to affirm their own indentities in office. A classic case, discussed in detail in these pages, is the disjunctive presidency of Franklin Pierce. Order shattering is never far away.

Beyond that, there is not only political but secular time. If political time centers on presidential power, secular change in the mode of government operations affects, cumulatively, presidential authority. This unidirectional evolution falls into four eras that in general (if not always in detail), would probably gain wide consensus: the Patrician Era (1789-1832), the Partisan Era (1832-1900), the Pluralist Era (1900-1972), and the Plebiscitary Era (1972 to date). Thomas Jefferson is the purest and most complete example of reconstructive leadership because he operated in a near void of organized opposition at a very early moment in the development of social (and thus governmental) complexity. Over time, the growth of this complexity has produced a government that is so "thick" on the ground that its inherent resistiveness to presidential initiatives has made presidential achievement of reconstructive purposes more difficult and problematic with each new iteration of the power cycle. By the time we reach the present, impasse becomes the consequence—a major feature of the discussion of the presidencies of Ronald Reagan and George Bush, with which the work draws to a close.

Without any question, The Politics Presidents Make is the most ambitious effort at sustained pattern recognition ever attempted in this area of study. The overwhelming bulk of the book consists of a detailed, "thickdescription" effort to concretize the categories by looking at presidents in action in both political-time and secular-time contexts. It is a truly extraordinary effort at integration, synthesis, and comprehensive pattern recognition amid the myriad details of the historically contingent and the diversity of character, talents, and virtues of the men who served in this role. In general, at least for me, the argument works. Skowronek is remarkable not only for his erudition and accuracy in detail but also for the subtlety of his reflections on his cases. This is a work that is striking in its sensitivity to nuance and-above all, perhaps-in its keen awareness of the ironies of presidential action. At very many points, quite new analytical possibilities are raised and evaluated. To take just two examples, presidents in a disjunction situation recurrently tend to reify technique as substance becomes impossible to handle, and presidents pursuing the politics of preemption recurrently tend to risk or achieve de facto or de jure impeachment.

Needless to say, this study, important as it is, does not lie beyond criticism. Any effort to construct classificatory categories of this type is likely to disclose concrete cases that just do not fit. Skowronek himself identifies "three hard cases": Cleveland, Coolidge, and Eisenhower. While I see little difficulty in classifying Coolidge's general place in Skowronek's greater scheme of things, Cleveland's case is somehow associated with a realignment in which (uniquely in American history) the forces demanding change were defeated. Eisenhower "ought" to fit as a preemptor (the New Deal order was still robust, and he and his party were opposed to it); but he did not behave that way in office and also lacked the modal preemptor's temperament. (In earlier times, one could say the same of Millard Fillmore.) Real life is likely

to produce impure mixtures in concrete cases that classification schemes have difficulty accommodating. Yet if the model does, in general, seem to describe real-world trends and tropisms, such "hard cases" suggest less the need to discard the former than to work through the latter's implications.

Two more serious questions arise, both centering on preempting presidents, whom Skowronek calls "the wild cards of American politics," who have historically come to power because the normal screening or gatekeeping machinery for presidential selection has broken down for one reason or another. Inherent presidential disruptiveness in these cases has often verged toward the boundaries of the constitutionally permissible: Richard Nixon is just the latest of such cases in Skowronek's scheme. Yet the author, at the end, calls for a presidential strategy of "perpetual preemption" henceforth. In this context, it is particularly to be regretted that this book contains no detailed examination of at least one representative of this fourth category. To be sure, pretty much by definition, preemptors stand, in a sense, outside the cyclic pattern. But these cases illuminate issues directly specific to the author's closing argument, and at least one of them (Nixon?) should have been included accordingly.

Skowronek is not alone in concluding that within the past quarter-century, changes so fundamental in the organization and articulation of American politics have occurred that traditional historically derived precedents and models are becoming irrelevant to understanding what is going on in the here-and-now. From his perspective, the thickening of government has reached the point that presidential reconstructive activity is now, or soon will be, out of the question. Incumbents keep acting on cue from an old script but with diminishing effectiveness and increasingly bizarre consequences. Better, then, that they should give up acting out such roles and the public give up waiting for "Godot"—a new reconstructive president to bail them out of the mess their public affairs have got into.

Each president should thus now become his own preemptor. (Is Bill Clinton actually following this new script?) From such a change, a whole catalog of desirable consequences will follow: "Once shorn of the roles acribed to them in political time, leaders will in fact have little else to rely upon but reason, talent, ideas and character" (p. 445). In short, Skowronek's subtle dialectics of presidential power sum to an even more striking dialectic: the negation of an analysis that has occupied more than 400 pages up to this point.

One finds oneself struggling with two reactions to all this. First, one wonders, preemption for what—in behalf of what substantive values and concrete interests and coalitions in the society that elects these people every four years? In general, there is a tendency—ever more marked as we approach the present in these pages—to present an analysis that is so Oval Office—oriented that still-vital contexts of presidential action such as party and partisanship virtually disappear from view. And we do have that old problem with preemptors that Skowronek clearly identifies: How does the system keep the power drives of these figures within constitutional limits, particularly if the constraining power of other institutions continues its decay?

Second, how sturdy a support can this ideal preemptor gain from his pure qualities of "reason, talent, ideas and character"? They were just John Quincy Adams's

frame of reference for conducting his presidency. They seem more generally (as proposed unmediated drivers of the enterprise) to reflect our frequent preoccupation with eliminating politics to achieve pure policy "in the public interest"—a Progressive Era impulse that is with us still. While many factors were involved in Adams's defeat for reelection in 1828, his efforts to remain far above "mere politics" in the conduct of his office helped mightily to do him in. If there is any one sentiment among the enlightened that ought to be given up as we move into the next century, it is not the fixation on 'great presidents" as saviors but the striving finally to achieve some nonpartisan, nonpolitical ideal for government and its officials. Short of dictatorship, politics cannot be gotten rid of. For this reason, the preemptive virtues that Skowronek identifies in his heroic effort to find a way out of the present impasse would seem to be as effective a ticket to quick retirement for incumbents embracing them as it was for Adams.

All that said, however, it should also be said that any weaknesses this book contains pale into insignificance when measured by the magnitude of the accomplishment it represents. This is a magisterial work, one of the most important studies of the presidency-indeed, of American politics-ever written. Stephen Skowronek has made the most persuasive of cases for the value and significance of work in the American political development genre. He makes this case by doing the work and by revealing, in the process, a dense network of connectedness in action and context that would otherwise be inaccessible. His analysis of the impact of secular time on the presidential power cycles of political time provides (in addition to other things) a new and deeper insight into the present era's political impasse. At the end of the day, he comes very close to identifying the root problem affecting presidents, which prompts him to the sort of escape he then suggests. This is the allimportant fact that the Constitution is unchanging and nondeveloped, while at all times intersecting with a social, economic, and political world that has undergone incessant development from the beginning. The whole work may be read as an extended, powerful, and penetrating meditation on some of the global consequences of this fact.

University of Texas, Austin Walter Dean Burnham

The Scar of Race. By Paul M. Sniderman and Thomas Piazza. Cambridge: Harvard University Press, 1993. 212p. \$18.95.

It is not possible to understand American politics without eventually engaging the question of race. Of course, the centrality and character of debates on the status of African–Americans in the polity have varied enormously. Yet since before the founding of the republic, the "race problem" has been near the core of American national politics. Issues of race figured in the drafting of the Constitution, the enslavement of blacks weighed upon the consciences of Washington and Jefferson, Tocqueville's powerful chronicle of American society dealt extensively with race, a struggle between a race-based slave economy versus a free-labor economy precipitated the deadliest war in the American experience, and a range of constitutional debates (e.g., the scope and intent of the Fourteenth Amendment) and

modern-day civil rights protections (the Civil Rights Act of 1964 and Voting Rights Act of 1965) can be traced to efforts to protect the status of African–Americans.

In the long shadow of the American political history of race, Sniderman and Piazza's Scar of Race aims to tackle afresh the linkage of prejudice and public opinion. Their focus is on the modern era. Their method is the sample survey conducted by phone, both local (San Francisco Bay Area) and national in scope. The research is driven by an effort to understand whether the politics of race has somehow changed. To assure wide accessibility, the data reporting is deliberately kept simple, rarely reaching beyond figures or tables based on simple percentage comparisons or correlations. On the whole, Sniderman and Piazza's effort is, variously, illuminating and clever; yet, on occasion, it disappoints and frustrates. Let us consider several useful contributions made in The Scar of Race.

First, the research helps to specify the current complexity of the issues involved in racial politics. At an empirical level, Sniderman and Piazza find no tight clustering of key issue attitudes. An individual's opinions on affirmative action in employment are not likely to be interchangeable with the same person's views on open housing laws or level of economic assistance, if any, that government ought to provide to black communities. The relative lack of constraint immediately implies that there is no single, profound thread of prejudice that binds together the views of white Americans on these public policy questions.

Second, the book is a useful normal-science extension of the use of experiments within surveys. Following the lead of Howard Schuman, who first applied survey-based experiments to theoretical questions in the study of contemporary racial attitudes, and the complex survey vignette studies of Peter Rossi and his colleagues, Sniderman and Piazza exploit the power of modern computer-assisted telephone interviewing systems to develop ever more complex experimental designs. One clear lesson of their efforts is that survey questions directed at delivering benefits to a black individual do not elicit a racial double standard in behavior of the type that emerges strongly when benefits are proposed to be delivered to blacks as a group.

Third, the book makes clever and often enlightening use of a measure of anti-Semitism as its bedrock indicator of prejudice. Doing so simultaneously reveals the modern political potency of prejudice and escapes entirely the analytical ambiguity of meaning that often attaches to questions with explicit race-based content. Fourth, the book is one of several recent efforts to reintroduce a concern with stereotyping into sample surveys. It provides valuable data on the persuasiveness and the delimited (but quite real) political effects of antiblack stereotyping. Fifth, Sniderman and Piazza undertake a very provocative examination of the malleability of opinions. They use counterarguments to attempt to gauge the fixity of opinion on race. The results show a potential for great movement, although this movement has a clear-cut predominant trend.

Most frustrating, however, among the weaknesses of *The Scar of Race*, is a serious misreading or misinterpretation of the *new racism* thesis as advanced by such scholars as David Sears, Donald Kinder, and John McConahay. Sniderman and Piazza typically treat the new racism thesis as contending that core American values, such as individualism and the work ethic, rather than

constituting weapons against racism, are now the main engines of racism and that this new racial bias operates with special force among political conservatives. Neither component of the argument seems a fair depiction of the theory advanced by proponents of the new racism thesis. First, the latter maintains that a new form of expressing racial animus has emerged. A hallmark feature of this new racism is a more explicit concern with such values as the work ethic, though this is intimately fused with feelings toward blacks. Sniderman and Piazza's own research strongly supports at least part of this claim. For example, they show that even among the highly educated, believing that "if blacks would only try harder, they would be just as well off as whites" or that "most blacks on welfare programs could get a job if they really tried" are powerful direct determinants of attitudes on economic assistance to blacks-exactly as the new racism thesis would predict.

Furthermore, to address the second component of Sniderman and Piazza's treatment of the new racism thesis, I know of no survey-based research suggesting that this new racism operates with special or differential force among ideological conservatives. Hence, while it is quite useful to show that whatever antiblack bias exists

when policies focus on group benefits is not unique to conservatives, this finding does not challenge the core of the new racism argument. The new racism thesis has many weaknesses, but this research has not taken us far toward resolving them.

Less troubling but still problematic is the inattention to group conflict theories as an alternative to both the new racism thesis and Sniderman and Piazza's politicization-of-race theses about modern race politics. Conflict models have considerable power to explain the difference found between popular receptivity to individual benefits versus collective or group benefits. Moreover, it might help explain why the tests of opinion malleability find the greatest movement on the group benefits question and that the trend of movement is disproportionately from pro- to antibenefit delivery.

Despite several limitations, *The Scar of Race* adds a needed perspective. It will advance discussion among specialists in the area and contribute to current efforts to understand the tenacious forces of race and racism in national politics.

COMPARATIVE POLITICS

Hostage to Revolution: Gorbachev and Soviet Security Policy, 1985–1991. By Coit D. Blacker. New York: Council on Foreign Relations Press, 1993. 268p. \$16.95 paper.

Coit Blacker has produced a compact and very readable book that reviews the turbulent changes in Soviet foreign and security policy under Gorbachev. He writes in a well-organized and accessible manner, effectively using subtitles and verbal "road maps" to help the reader along. On the whole, Blacker presents a balanced description of the Soviet policy revolution that led to the end of the Cold War. After reviewing the Brezhnev legacy, he examines the effect of Gorbachev's "new thinking" in four areas: the conceptual basis of Soviet policy, military doctrine and strategy, arms control, and civil-military relations. In both style and content, the book is quite suitable for an upper-level undergraduate course on the history of Soviet or Cold War foreign policy.

At the same time, Hostage to Revolution is much weaker at an explanatory level, doing little to advance the scholarly debate. Despite the author's claims in the book's introduction, he presents a rather standard Sovietological analysis. Blacker has read a wide array of (translated) Soviet sources and, based on these and his understanding of the changing content of policy, offers a plausible reconstruction of Gorbachev's motives and reform strategies. Keeping with the Sovietological tradition, the book is also for the most part atheoretical. In other words, Blacker is at his best describing the content and implications of the Gorbachev-era changes in security policy. He is much weaker at explaining the why and how behind the reforms.

Indeed, Blacker's explanatory focus—economic crisis as the motor of change—is so simple and self-evident that the reader is left with a lingering question of "So what?" What insights are gained from an argument of this sort? Blacker rightly criticizes (in both his introductory and concluding chapters) international relations theory as being poorly equipped to anticipate or explain peaceful systemic change such as that brought about by the Gorbachev reforms. Yet he does not offer or elaborate a domestic-level alternative of his own, except to suggest that "economic crisis" is central and all other explanatory factors are essentially derivative (e.g., pp. 190–91).

As Blacker's story unfolds, we are told at various points that ideas matter, institutions are important, and leaders learn. Who would disagree? The analytic challenge is to explore the conditions under which such factors become relevant. To do this, however, requires greater attention both to domestic politics and theory. How and why did certain ideas reach Gorbachev and come to inform the content of his "new thinking"? If the old ideas on international politics were so deeply embedded in the pre-Gorbachev system (as Blacker persuasively argues), how could they be overturned with such relative ease once a new leader came to power? Blacker is right on the mark to argue that economic crisis "opened up" Soviet politics. To stop there, however, is

to leave many of the most interesting questions unanswered.

It is fair to ask whether the domestic political process under Gorbachev could have been explored in the detail necessary to address such questions. The answer is *yes*, but not with the sources Blacker has utilized. For reasons that are not entirely clear, he has chosen to rely almost exclusively on U.S. government translations of the Soviet media. Aside from the evident problem of selection bias (a point Blacker never addresses), reliance on such materials intended for wide consumption seriously hinders the author's ability to reconstruct the process behind the "new thinking."

Much, in fact, has been revealed through Soviet/ Russian materials not typically translated by the U.S. government. One scholarly journal, for example, has published the transcripts of the Reykjavik summit, a consideration of which would have strengthened Blacker's interpretation of this key episode (pp. 104-8). More important, a number of key figures have published memoirs (former Chief of the General Staff Akhromeyev, academic specialist Georgiy Arbatov, advisor Anatoliy Chernyayev, and former Politburo members Ligachev and Ryzhkov, to name only a few). While such works must be read with caution because individuals maneuver to secure their place in history, they nonetheless offer many remarkable insights. Beyond written works, one can, of course, "go to the source" and interview the architects of this remarkable revolution. While Blacker mentions his many helpful conversations with Soviet specialists (p. 8), his notes give no sense of what he gleaned from the interviews or how such information was integrated into the analysis.

To appreciate how neglect of domestic political process hinders Blacker's analysis, compare Gorbachev's foreign policy with that of post-Soviet Russia. Economic crisis, Blacker's key explanatory variable, is present in both periods. Yet in today's Russia, the "new thinking" has come under withering attack, while a different set of ideas more in keeping with traditional notions of power politics has come to the fore. Russian foreign policy, reflecting this combination of old and new, has become a strange mixture of realpolitik and liberal internationalism.

How to explain these changes? Clearly, part of the answer is the dramatically different international political environment of post-Soviet Russia (especially important here is what Russians call the "near abroad"—the successor states to the USSR). Equally important, however, are fundamental changes in the domestic setting; the process has opened up in ways unheard of even at the end of the Gorbachev era. Indeed, in Russia today, the problem faced by promoters of new ideas is not getting access to top decision makers (as it was in the USSR) but ensuring, once they reach elites such as Yeltsin, that the ideas have some lasting influence on policy.

Blacker's main concern, however, is the Gorbachev period, where the challenge is to get some sort of analytic leverage on an extraordinarily complex set of changes. The way forward is to incorporate, and expand upon, the work of scholars such as Matthew Evangelista and Jack Snyder, both of whom have sought to build much-needed bridges between international relations theory, comparative politics, and "Soviet" studies. Indeed, if recast with more explicit attention to theory, Blacker's study would have been much sharper analytically, with the potential for contributing to several different research programs in international relations and comparative politics. These include work on policy ideas, civil-military relations, negotiation/bargaining theory, and (more generally) domestic sources of state behavior. As written, however, the book leaves the reader to tease out any connections to the broader literatures.

In short, Blacker has written an informative if limited book. Students and members of the policy community will find much of use here. Hostage to Revolution is a good account of six years of revolutionary change. However, the reader who is interested in new interpretations that draw upon new source material and contribute to the broader social science literature will have to look elsewhere. Perhaps reflecting a field ("post-Soviet studies") in transition, Blacker's study is, ultimately, a mixture of good and bad. It is better than many Sovietological analyses yet still falls short on both methodological and theoretical grounds.

University of Pittsburgh

JEFF CHECKEL

Parliamentary Change in the Nordic Countries. Edited by Erik Damgaard. Oslo: Scandinavian University Press, 1992. 224p. \$39.95.

Coalition Politics and Parliamentary Power. By Mats Sjölin. Lund: Lund University Press, 1993. 230p. \$21.50 paper.

These recent books on parliaments and parliamentary practices are the products of a persistent endeavor, on the part of some Nordic scholars, as well as research milieus, to study the impact of institutional forces in political life. Although clearly not flying the flag of the behavioral movement during the sixties and seventies, they continued presenting the kind of basic research that other scholars took for granted and that today enjoys a modest revival among Nordic political scientists. Damgaard's edited volume and Sjölin's monograph are different both in scope and intent and will have different value to different readers. They share, however, the same analytical background in contemporary comparative parliamentary research—even though the moorings are not quite similar.

In the Damgaard volume we are presented with accounts of recent parliamentary trends in Denmark, Norway, Sweden, and Finland sandwiched between an introduction and a comparative analysis, both produced by the editor, who is also responsible for the chapter on Denmark. The analysis of the three remaining parliaments are written by country specialists: Dag Anckar, Hilmar Rommetvedt, Anders Sannerstedt, and Mats Sjölin. According to the editor, the purpose is to analyze important trends in the parliamentary development of the Nordic countries during the past few decades. Criteria for "importance" is partly centrality within the comparative literature discussions, partly political importance within the countries in question. In practice, the "decline-of-parliaments" thesis functions as a kind of overarching point of reference, even if explicitly "not

the main object" of the analysis (p. 16). The editor is also evidently skeptical as to its research potential.

Parliamentary analysis deals with both internal developments in parliament and its relations to the external world, particularly the executive. Starting with Danish experiences during the 1980s, contextual particularities immediately create problems for comparative analysis; for these experiences are indeed quite remarkable to those used to a fairly straightforward distinction between government and opposition. In Denmark during the Schlüter "four-leaf clover" government (1982-88), the very terms evaporate when analyzing the dealings in the Folketing. There were "alternative majorities" in several policy areas—most notably in security matters. this means that the minority coalition government, headed by the conservative Schlüter, accepted its minority position in several fields and let the "opposition" determine "government" policies. The era of "the governing parliament" came about because one of the parties not in government—the radical liberals—wanted the government to continue and the government was willing to pay the necessary price.

The chapters on the four country developments outlines the major parliamentary trends over the last two decades. They all focus on changes along the parliament—government axis, as seen from parliament. The historic accounts reveal that the old label for the Scandinavian region ("consensual democracies") has to be reconsidered. In short, there is more open and fierce politics on the parliamentary scene than there used to be in the 1950s and 1960s. Still, we also get the proper warnings against jumping to the quick but unwarranted comparative conclusions. Sannerstedt and Sjölin argue, for example, that in Sweden the "image of consensus is less salient, although political negotiations continue to be of great importance" (p. 99).

In his summary, Damgaard points to three substantial changes: weaker governments, increased parliamentary activity, and more parliamentary power. There is a decline of consensus but not a decline of parliament. We have, however, the Finnish exception—not, according to Dag Anckar, that Finland has gone through a decline in parliamentary power (though that belief is widespread) but that Finnish governments are increasingly majority governments. Due to legislative procedures that give one-third of the members the right to postpone and, in fact, "torpedo" almost any government proposal (p. 161), the threshold for a sustainable government majority in the Finnish parliament is 67%, not 51%. As Anckar points out, this gives the term "oversized majority" a quite different meaning in the Finnish case.

The Damgaard volume is highly recommended as an updated analysis of Nordic parliamentary trends. The country chapters are somewhat uneven, but all provide the kind of information useful for anyone aiming to keep a professional eye on developments in Nordic politics. The style and presentation would also make it suitable for courses on Nordic or West European politics. Some rather standard queries could, however, be raised about the book if viewed exclusively as a comparative project. The country presentations are bound together not by any coherent analytical frame but by a rather loose set of questions. The empirical material varies according to availability and author interests. Rommetvedt for example is particularly keen on the analysis of party dissents in the committee recommendations in the Norwegian Storting. More unnecessary, perhaps, is the individualistic approach to theories and conceptualization. Inevitably, therefore, the comparative discussion by Damgaard toward the end is nurtured mostly by the

empirical qualities of the book.

Coalition Politics and Parliamentary Power is by Mats Sjölin, the coauthor of the Swedish chapter in the Damgaard volume. Its theme is the role of parliament and parties in political decision making. Empirically, it is a book about Sweden, but he also argues the theoretical case that the theory of political decision making could invigorate the study of parliaments and parliamentary practices in general. And although the decline-of-parliament thesis is much in focus in this book too, Sjölin's view is that this debate "is in need of theorizing, which applies to parliamentary research in general, and in need of specification, which applies to the question of decline in general" (p. 202).

The problem to be analyzed in Sjölin's book is "power relations and patterns of cooperation and conflict between the political parties in the struggle over the framing of policies" (p. 26). The empirical basis for this is the reports of the committees in the Swedish Riksdag regarding government proposals. The period covered is from 1970 to the early 1990s. Two empirical questions recur repeatedly throughout the book. First, how can we explain government-opposition processes in Sweden? Second, has the power of the Swedish parliament declined? It turns out that the opposition muscle is about as strong (or weak) in Sweden as in comparable Western democracies. Sweden is at least no deviant case in this respect. There has been a trend toward a higher level of changes in government proposals, enforced by the opposition, but equally striking is the ebb and flow in this relationship, connected with government base and party constellations in the Riksdag. There is no convincing evidence to substantiate the parliaments-in-decline thesis. In choosing between remaining alternatives—stable or increased parliamentary power-Sjölin argues that the ups and downs of parliament during the latter two decades leaves the issue unsettled. Still the weakening of governments may indicate a change toward increased parliament power. The question, however, is whether this derives from temporal fluctuations or lasting structural change.

Sjölin's eclectic approach in developing his theoretical argument makes refreshing reading. Here we also find his main mission, namely, to widen the field of traditional coalition analysis to include discussions about parliamentary decision making and coalition politics. The fatal fault of the comparative literature on government formation and parliamentary politics alike is the lack of trespassing—in other words, the insufficient amount of theoretical cross-fertilizing—within the tradition. Sjölin sets himself the task of bringing together various approaches at least in the sense of considering, within the same empirical analysis, the fruitfulness of coalition theory of the public choice tradition, the mainstream comparative government tradition, and "modern power theory."

Does he succeed? The aims are admirably ambitious, and Sjölin clearly has a point in attacking the compartmentalization of much research within this field. His discussions of the various approaches are fair and balanced. Still, there is not much new in, for example, his criticism of the formal coalition theory. At times, the presentation and discussion of the literature could have been shortened. The exercise takes a more fruitful turn

when Sjölin comes to the bit in which he himself has more faith—the power theory, or tradition of power analysis. Employing concepts and distinctions like "autonomy" and the various "faces of power," he manages to put across the inadequacies in the debate on the decline of parliaments and also to present the complexities of parliamentary analysis in general. From the many shrewd observations on the exercise of power in parliamentary politics it also appears that Sjölin feels more comfortable among the foxes than among the hedgehogs in the community of scholars. The trouble with that position, however, is (as all foxes know) that it does not make the world easier to understand.

KNUT HEIDAR

China's Quest for National Identity. Edited by Lowell Dittmer and Samuel S. Kim. Ithaca: Cornell University Press, 1993. 305p. \$42.50 cloth, \$16.95 paper.

This remarkably coherent symposium should command broad attention throughout our discipline because it illuminates in numerous ways the confusing complexities and uncertain relationships among such supposedly self-evident concepts as state, nation, country, culture, society, and civil society and such basic sentiments as nationalism, patriotism, and a variety of national, social, and political group identities. With embarrassing regularity, scholars will labor to define these concepts but then, in the pages that follow, slip into treating many as synonyms. The differences are important because political systems function quite differently depending upon the relative strength of each entity and the emotional attachments of their populations. Although this book is largely devoted to examining the Chinese case and although Chinese details, with the peculiar spelling of names, can be overwhelming for nonspecialists, there is enough food for thought in it to enrich the theoretical understanding of generalists, especially comparativists and theorists

Indeed, the two editors in their joint introductory and concluding chapters explicitly address larger theoretical issues of national identity. In the process of relating the concept of national identity to political development theory, they argue that "the substantive content of national identity is the state and that the state defines itself by what roles it plays... in the international arena" (p. 17). Fortunately, however, they do not abide by such a narrow, state-oriented concept of national identity. (Possibly because the chapters are jointly authored, they are enlivened by a few harmless contradictions.)

The Chinese case—involving, as it does, a distinct civilization—is particularly helpful for highlighting many of the fundamental issues associated with national identity. The issue of whether the Middle Kingdom, a bureaucratic empire headed by emperors, should be classified as a nation–state highlights the problem of arriving at a proper definition of the nation–state. What does it mean that in modern times the Chinese "state" has undergone dramatic changes but the Chinese people have remained seemingly secure in their "Chineseness"? Is a powerful sense of cultural identity that does not involve the state a real form of nationalism? If these constitute valid questions, then maybe Michael Ng-Quinn is a bit too quick and easy in calling the ancient

dynasties nation-states. Michael Hunt picks up the historical account with a review of China's reaction to the modern West and concludes that "the preoccupation with state power stood—and still stands—as one of the single features of Chinese national identity" (p. 76). His skillful recounting of the history does drift a bit from the question of China's "quest for national identity," so it is unclear whether the desire for a "strong state" reflects a weak sense of national identity or, rather, a sense of cultural identity that was so strong that the Chinese became hypersensitive to any sign of being inferior. Unquestionably the challenge of modernization forced many Chinese, like people in other non-Western societies, to question their traditions. In their confusion over why China was weak and the West seemed so powerful, Chinese intellectuals became obsessed with the idea that China needed a "strong state." Few Chinese intellectuals would have appreciated George Unwin's observation in Studies in Economic History: "The expansion of England in the seventeenth century was an expansion of society and not the State. Society expanded to escape from the pressure of the State." In contrast to the intellectuals, ordinary Chinese have generally known that things are always better, especially economically, when the political authorities are not overly strong. What neither the intellectuals nor the common people have ever understood is that China never developed an effective "civil society." It lacked a tradition of autonomous interests, engaged in articulating competing policy demands.

With respect to this deficiency, it is significant that Merle Goldman, Perry Link, and Su Wei start their interesting coauthored contribution on the current role of the intellectuals by noting a student's slogan at Tiananmen, We Love Our Country but We Hate Our Government, which showed that the students were able to distinguish between "state" and "society"—something that has historically eluded most Chinese intellectuals. The anthropologist James Watson clarifies a great deal by suggesting that in pinning down national identity, we should not necessarily focus so much on matters of beliefs but recognize that in some cultures identity is based more on valuing everyday practices, particularly ones with ritual overtones. That is, praxis counts for more than ideology. (Could it be that the Christian tradition has left secular Western scholars with an exaggerated sense of the importance of beliefs, so that we assume the durability of Communism in China depends upon whether, in their hearts, the Chinese really "believe" in the ideology when, in fact, it may be enough that they continue to act as though they believed?) In any case, an awareness of shared practices is apparently more important in defining Chinese national identity than questions of deep inner feelings and values. This view is in part confirmed by Richard Wilson, who reports on recent research findings that current Chinese socialization practices produce both continuities and changes in what it means to be Chinese.

The question of Chinese national identity is of growing political importance because it is widely assumed that the void created by the erosion of Marxist-Leninist-Maoist thought will be filled by Chinese "nationalism." But what is the content of that nationalism likely to be? The glib idea that economic growth can solve China's identity problem is challenged by Lynn White and Li Cheng, who show that the people in the economically dynamic coastal provinces continue to have identity problems. China's more active role in foreign affairs has

also been of limited help, as Peter Van Ness demonstrates in his analysis of Beijing's attempt to identify with the Third World and Robert Scalapino in his recounting of China's relations with her neighbors.

In short, therefore, it is far from self-evident that the Chinese have a set of shared symbols, values, and myths that might be easily brought together to shape a Chinese self-image that could both guide domestic development and be projected in foreign relations. Elsewhere in the world, the end of the Cold War has forced us to reexamine the importance of various forms of primordial group identities. Good scholars that they are, the authors of this book have sought to build on the earlier work on political development and identity crises. (At the risk of seeming to be petty-minded, I must point out that there are some inaccuracies in their understanding of the contributions of the Social Science Research Council's Committee on Comparative Politics, but on the other hand it is good that they have recognized the significance for political analysis of Erik Erikson's theories.) What is important is that all who want to study the increasingly significant question of nationalism and national identities will have to build on this work.

Massachusetts Institute of Technology Lucian W. Pye

Making a Market: The Institutional Transformation of an African Society. By Jean Ensminger. New York: Cambridge University Press, 1992. 212p. \$49.95.

Jean Ensminger has written an excellent book that addresses several different audiences. She is an anthropologist, but much of what she has to say is addressed to economists, sociologists, and political scientists. She "combines the individual-actor approach of economics, anthropology's appreciation of institutional constraints, incentives, and ideology, and the attention to power that we associate with Marxist analyses" (p. 1). The fact that the book cuts across so many different disciplines is one of its principal merits. The author draws from these different fields not ad hoc but in a systematic fashion. She argues that only through a synthesis of these different fields of study is it possible to obtain an effective understanding of how market forces contribute to social change. Her main objective is to show how rational choice and new institutional economic theories can be powerful analytical tools in explaining the process of change among the pastoralist Galole Orma of northeastern Kenya.

Ensminger argues that the best way to understand the process of change among the Orma is to go beyond the static analyses of classic economic and anthropological theories. She situates her analysis of the Orma within the analytical framework of Douglas North's new institutional economic perspective. The advantage of this perspective is that it assumes that institutions have an important effect on the options available to, and taken by, individual and social groups. Two key assumptions, in particular, inform the perspective. The first assumption is that transaction costs are not zero, so that change of any kind usually involves some costs. The second assumption is that economic exchanges are shaped by more than price and quantity: there is an underlying normative (qua ideological) dimension that cannot simply be dismissed on the grounds of being not quantifiable. For anthropologists and social scientists interested in socioeconomic and institutional change in the developing world, these two assumptions are important because they highlight the fact that in the short and medium term, economic change might generate more costs than benefits.

In her book, Ensminger sets out to explain how the spread of market forces transformed labor, social, economic, and property relations among the Galole Orma. She relies on historical and longitudinal data of a group of households to show the asymmetric effects that the penetration of market forces have had on the Galole Orma. By employing both the new institutional economic perspective and the ethnographic approach of anthropology, she is able to analyze the process of institutional and ideological change within the Galole Orma community. In particular, she shows how these changes gradually led to a shift within the Galole Orma community away from pastoralism toward a more sedentary community of cattle herders.

Her application of the new institutional economic perspective to the study of the process of change among the Galole Orma is generally convincing. For political scientists, the most striking claim made by the author is the one made in chapter 6. There she argues that "in the aftermath of increasing economic growth and resultant economic diversification among the Orma, there was a breakdown in community and a failure of collective action" (p. 143). While she is quite persuasive in her argument as to why there was a breakdown (particularly because of the increasing inability of elders to enforce property rights), she overdoes her case when she claims that the failure of collective action at the community level was effectively supplanted by the state in Kenya. Her attempt to explain state formation within the context of new institutional economic theory becomes dangerously mechanistic at times. Her argument that the benefits offered by the state through its increased institutional penetration of peripheral communities such as the Orma have led to growing acceptance of the state assumes a rational outcome that is difficult to sustain in Africa today.

The fact that the penetration of market forces and state institutions have had a significant impact on pastoralists like the Galole Orma is undeniable. To make the claim, however, that "the lessons from this case study of state incorporation speak also to the issue of state formation, and more generally to the relationship between economic growth and the breakdown of communities, and the institutions that support communities, in this case marriage, lineage, clan, gerontocracy, patriarchy, and patron-client relations" (p. 143) suggests that the author does assume that change always moves in the direction of increasing efficiency or economic growth. Although she recognizes that there have been losers, particularly the nomads, she implies that there has been a convergence of interests between the state elite and Orma elite and nonelite alike.

The main point is not that the penetration of market forces and state institutions has not reshaped the Orma community and led to a breakdown of traditional patterns of collective action. What is at issue here is that this process of change in Africa rarely, if ever, involves the complete breakdown of "lineage, clan, gerontocracy, and patron-clinet relations." In most instances, these elements continue to influence institutional change and have an impact on economic development. Whether

elites use these quasi-traditional elements to enhance their own political and economic positions, or the elements persist because institutional and economic change is "lumpy" and reflects multiple asymmetries, the outcome in Africa, at least in terms of institutional and economic development, has generally been a suboptimal one.

Purdue University

DWAYNE WOODS

The Politics of Food in Mexico: State Power and Social Mobilization. By Jonathan Fox. Ithaca: Cornell University Press, 1993. 280p. \$39.95.

The sun has not set on hopes that state bureaucracies in developing countries can implement reforms biased in favor of the poor. This hope persists despite the relatively sad record to date. The literature is replete with examples of reforms that have been stillborn or sabotaged or have produced unintended and even damaging consequences. Constraints on reformers with grand objectives are considerable. They must convince political leadership to back their change strategy. They must devise the policy with little information on how it will fare in practice and show quick results to maintain momentum. They must be highly skilled in managing the administrative, political, economic, and ideological dimensions of the new policies until they are selfsustaining. Reform policies, however, raise a red flag to supporters of the status quo. The policies divert resources from existing programs, whose committed supporters in the bureaucracy and civil society oppose and undermine the changes. The poor are typically unorganized and offer few resources to support the reformers other than a promise to accord legitimacy to the regime if the reforms work. Economic cycles inevitably squeeze the government treasury, and political leadership changes-resulting in a review, and sometimes abandonment, of policy just when the new program might be showing accomplishments.

Jonathan Fox confronts each of these issues head-on in a theoretically relevant, well-documented, and sensitive analysis of food policy in Mexico. His case study is the Sistema Alimentario Mexicano (SAM), a rural-development-cum-food-distribution policy instituted under Mexico's Lopez Portillo presidency (1976-82). In 1980, the Mexican government was alarmed by rapidly rising food imports but was not about to scrap the 1917 peasant landholding legislation, which, through the sacrosanct collective farm unit (the ejide) suboptimized domestic food production. José Lopez Portillo gave status and backing to a young team of agrarian reformers who had new ideas: make peasant producers the prime beneficiaries of state subsidies in seeds, fertilizers, credit, technical assistance, grain purchase, and water, while extending the state food distribution network to remote rural areas. the goals were to increase production, save foreign currency, reaffirm the viability of the peasant farmer, raise nutritional levels, and enhance political legitimacy for the regime from groups who, seven decades before, had been the footsoldiers for the Mexican Revolution.

The reformers ran into typical problems: opposition from agricultural bureaucrats who wanted all subsidies to go to large farms in irrigated areas; decline in highlevel backing as Lopez Portillo became a lame-duck president; a state-centered political system in which peasant organization was inherently weak; and sharply reduced state finance after the 1982 debt crisis. Fox traces the orientations and capabilities of all the major actors in this drama (e.g., DICONSA, a food distribution agency) and concludes that the policy was most effective where reformers succeeded in organizing the peasant beneficiaries in the context of the reform itself. For example, newly created community food councils used official regulations, shrewdly drafted by the reformers, to hold DICONSA agents accountable for delivering food to rural stores where peasants could buy at subsidized prices.

This research forms part of the literature voguishly called the "new institutionalism." Fox eschews the label and deals industriously with the timeless concerns of organizational effectiveness and responsiveness. The book quite adequately explains the position of the major players in the complex Mexican political system, which helps show why the reform took the course it did. Fox dismisses what he sees as a dichotomy between state-centered and society-centered analyses of bureaucratic behavior and posits the *interactive* alternative, which combines the two. An example of an interactive finding would be change instituted by elites which impinges on beneficiaries, who constitute themselves into groups, which ally with the elites to create a reform coalition.

This analytical concept is linked to a suggestive strategy for reform mongering. The "sandwich strategy" is not a food handout but, rather, an objective alliance between entrepreneurial reformists and autonomous social movements to offset the power of entrenched authoritarian elites. The "sandwich strategy" is the SAM reformers' contribution to praxis, skillfully articulated by Fox, who quite rightly claims that the strategy has cross-national implications. Scholars and practitioners alike are well advised to study Fox's findings in this realm for theoretical and practical guidance, and chapter 7 (which studies the technique) would fit well into any course on policy formulation and implementation.

One criticism is that Fox neglects to discuss how food policy and peasant agriculture were affected by subsequent events. After the Lopez Portillo government, agrarian reformers vainly waited for a "Son of SAM" to rescue the collective-landholding ideals of the Mexican Revolution while allowing Mexico to feed itself. Under Miguel de la Madrid (1982-88), the Mexican state was penniless and ignored the peasant farmer. Carlos Salinas de Gortari (1988–94) then amended the 1917 Constitution in a way that many analysts believe will end the ejido and permanently change the context for official policies toward the rural poor. The value of Fox's contribution is thus not his description of the SAM but the expertness with which he uses Mexican food policy to draw important theoretical and practical lessons for state-induced change. The findings, which emphasize targeted organization of the poor more than class mobilization, are salient in one degree or another for Asian, African, and other Latin American cases, as well as for traditionally neglected groups in the United States and other richer countries. The Politics of Food in Mexico is a fine example of a case study grounded in exhaustive field research. It addresses real world problems in a theoretically innovative way.

University of Texas, Austin

Peter S. Cleaves

Nations of Immigrants: Australia, the United States, and International Migration. Edited by Gary P. Freeman and James Jupp. New York: Oxford University Press, 1993, 250p. \$18.95 paper.

Is the process of state-formation among "nations of immigrants" distinctive in some important ways? Strange as it seems, despite the considerable weight attributed to immigration in explaining the political, economic, and social development of the United States and the small number of other countries that fall within this category, little attention has been devoted to the more general question. And perhaps even more surprisingly, historians and social scientists concerned with particular countries within the category have seldom availed themselves of the possibility of comparison to test their observations, or at least enrich them by engaging in the sort of counterfactualism that is rendered possible by relatively similar experiences elsewhere. As the editors of the present work remark in their introductory essay, "One of the very few serious attempts to understand settler societies in a comparative framework is Louis Hartz's The Founding of New Societies," an edited volume published thirty years ago, when "political culture" reigned unchallenged (p. 9). But although the Hartz collection contains some stimulating essays, surely even the most conservation-minded among us would agree the field has remained fallow long enough to stand vigorous cultivation.

Although less ambitious, the present volume is a well-executed collaborative examination of the sources and consequences of recent developments in immigration policy in the United States and Australia by scholars from both countries. It is a stimulating beginning in a promising area of research, and contains valuable suggestions for more comprehensive projects along the lines noted.

Comparison, here, serves not so much to achieve broad generalizations as to provide a better understanding of each case by highlighting its specificity. The introductory chapter by the editors sketches the distinctive historical configurations of the two countries, highlighting differences as well as similarities. The juxtaposition of the two cases brings to mind that the notion of "nation of immigrants" should be made time-specific, reflecting a combination of objective criteria (e.g., the rate of immigration in relation to population) and subjective perceptions. In this perspective, the United States was not a "nation of immigrants" at the time of the Founding, but became one from about 1830 until it acted very effectively to change its character in the 1920s; Australia in effect foreclosed its transformation into a "nation of immigrants" by closing its borders in the 1890s, before the arrival of a significant flow of continental Europeans and Asians. Both countries reopened in the late 1960s; but although Australia is today much more a "nation of immigrants" than the United States (about one out of five Australians was born abroad, as against only one out of twenty Americans), immigration into the United States has been and remains a source of much greater ethnic diversity. Despite the broadening of sources of immigration in the post-war period—first to encompass southern and eastern Europeans, and later Asians—as of 1986, 75% of the Australian population was of British or Irish descent; and immigrants of "English-speaking background" still account for nearly half of the annual intake today.

The chapter also provides some intriguing theoretical suggestions regarding the role of immigration in shaping the very different patterns of working-class formation in the two countries. Overall, Australia emerges as a "might have been" California—if the transcontinental railroad had not been built—i.e., an isolated white labor commonwealth that managed to maintain control over membership until the middle of the twentieth century, and thereby shape a distinctive path for capitalism and state-formation. The chapter might have been further enriched with some maps, tables, and graphs with basic information regarding historical and contemporary patterns.

Part I provides detailed accounts of immigration policy proper as well as of its underlying political dynamics. Although uninformed American readers will find the chapter by Robert Birrell on Australian policy especially useful, Frank Bean and Michael Fix also provide a very good summary of recent developments on the American side. The comparative analysis by Freeman and Katherine Betts of "the politics of interests in immigration policymaking" is of greater theoretical import. They conclude that immigration generates conflicts between the same sorts of interests in both countries, but their relative weight varies. In keeping with the distinct historical patterns noted, labor remains more influential in Australia; and despite the fact that ethnic groups have been given a corporatist status in the Australian system, they have greater legitimacy as political actors in the United States.

Part II is devoted to the impact of immigration on the economy; reviewing the recent macro- and microeconomic literature, its two chapters concur that, notwithstanding significant differences in the skill level of immigrants, in both countries immigration has had a "Pareto optimal" effect, i.e., it has increased the welfare of the immigrants without generally reducing the economic position of most residents, while substantially benefiting many of them.

Part III, on "Immigrant Settlement," highlights one of the sources of persistent differences between the two countries. From the very outset until quite recently, immigration to Australia was sponsored and funded in whole or in part by government, whereas on the American side (with the major exception of African slaves) "immigration begat immigration," by way of the networks generated by earlier arrivals. Concomitantly, Australian authorities exercised much greater control over the choice of immigrants, and played a more active role in the process of settlement as well, whereas on the American side the immigrants were largely left to their own devices after arrival. By and large this is still the case today in both countries. Consequently, there is an ongoing national debate in Australia regarding the appropriate policy of incorporation, whereas on the American side the subject is much more diffuse. While the Australian situation is well presented by James Jupp, the American chapter by Robert Bach is more problematic. In part, as Bach points out, the very structure of the situation makes it difficult to talk about American "settlement policies"; nevertheless, more attention might have been given on the American side to refugeescurrently, some 130,000 a year-whose settlement involves legally prescribed intervention by all levels of government, and to the extensive activities of states and especially urban governments in this sphere.

Last but not least, Part IV is addressed to what

constitutes throughout the world of industrial democracies the hottest aspect of immigration—the matter of incorporation of culturally distinct groups. Although entitled "Immigrant Minorities and Multicultural Policies," the contribution by Stephen S. Castles, one of the most valuable in the book, amounts to a deconstruction of the doctrine of "multiculturalism," which was launched in 1989 as the official policy of Australia. Contrary to what the term evokes in the American context (and thereby in Europe as well), in Australia multiculturalism "is not defined in terms of cultural pluralism or minority rights, but in terms of the cultural, social and economic rights of all citizens in a democratic state" (p. 190). As presented by Castles, most of the measures under this umbrella are designed to reduce various forms of institutional discrimination non-Anglo immigrants, old and new, face in egalitarian Australia. In short, this "multiculturalism" is highly universalistic in its import, and when applied to immigration policy means that Australia will welcome highly skilled immigrants even if they are Asian. Beyond this, the adoption of multiculturalism as a general policy also entails limited government support for ethnic organizations and ethnic media, features that are highly developed in the United States, possibly because of the longer experience of minority advocacy where a critical mass was present because of sheer size (e.g., the organizational flowering of Jewish and Catholic minorities around the turn of the twentieth century) and the concomitant dynamics of the market.

Although DeSipio and de la Garza provide some suggestive observations regarding incorporation on the American side, particularly on the subject of access to citizenship (which is not covered with regard to Australia), their essay unfortunately does not provide the materials for a systematic comparison with the Australian situation as presented by Castles. Given the acute public concern with incorporation in all contemporary receiving societies, and the conceptual confusion in the proliferating literature on the subject, a systematic comparative analysis of the situation should rank high on our research agenda.

Graduate Faculty, ARISTIDE R. ZOLBERG
New School for Social Research

Environmental Risk, Environmental Values, and Political Choices: Beyond Efficiency Trade-offs in Public Policy Analysis. Edited by John Martin Gillroy. Boulder: Westview, 1993. 189p. \$42.00 paper.

Contributors to the Gillroy volume argue that when traditional market methods, alone, are used to analyze public choices, conflicts over environmental risks often resist resolution. Including original essays by chemists, economists, philosophers, and political scientists, the collection is divided into three sections. Parts One and Two—with essays by Gillroy, Steven Kelman, Robert Paehlke, Vicente Medina, Christopher Bosso, and David Henderson—analyze the nature of environmental values and risks and provide suggestions for handling conflicts concerning them. Part Three, with essays by William Gunderson, Talbot Page, Barry Rabe and Gillroy, and Douglas MacLean, surveys several cases of citizens' NIMBY (Not in My Back Yard) responses to attempts at siting environmentally risky facilities.

Because the Gillroy collection encompasses articles exhibiting a wide range of disciplinary, methodological, and ethical standpoints, there is no specific thesis for which all the essays argue. Nevertheless the excellent introductory essay (chapter 1) by Gillroy provides two general themes addressed by all the contributors. One theme is the complicated nature of environmental risks and values, complications caused in part by the collective nature of many environmental goods. The second theme is the necessity of incorporating environmental values into our analyses of public decisions regarding risk. Although virtually all of the authors do an excellent job of defending and articulating the first theme, Page, Rabe and Gillroy have the best specific suggestions regarding the second theme, how to incorporate environmental values into policymaking. This incorporation is difficult, Gillroy argues, because economic methods, such as cost-benefit and risk-benefit analyses, help to construe the preferences of individuals in terms of a polluter's (prisoner's) dilemma. The dilemma is that, given the strategic reality of interpersonal relations, individual preferences result in a non-optimal collective provision of environmental quality. Incorporating environmental values into policymaking is also difficult, for example, because federal regulatory agencies fight each other in environmental turf wars (p. 82); because the Environmental Protection Agency has little clout (p. 86); because the American political system devalues planning and activism (pp. 90-91); and because the public assesses environmental risk in an unscientific way (p. 106).

Showing how to overcome such obstacles to including environmental values in public decisionmaking, Rabe and Gillroy use a Canadian case study. The case, on siting a hazardous waste facility, provides an illustration of a new strategy for environmental decisionmaking. Instead of modeling such decisions on the prisoner's dilemma, Rabe and Gillroy propose an assurance-game model in which universal cooperation, rather than being a free rider, is the preferred choice (pp. 156–157).

Obviously Rabe and Gillroy theoretically are correct about the desirability of the assurance-game model. The question their analysis raises is how to motivate the players in an environmental game to operate in terms of cooperation strategies. Hence the real question their analysis raises is not whether assurance-game models are desirable, because obviously they are, but whether real situations of environmental conflict can be resolved by following such models. Gillroy admits that using the assurance game—to model decisionmaking regarding environmental risk in NIMBY situations-requires full information, no uncertainty, and no suspicion on the part of any persons involved in the NIMBY situation (p. 166). Because such idealized conditions are rarely met in problematic controversies, and because risk imposers typically withhold information from the public, it is difficult to believe that the conditions necessary for using the assurance-game model are applicable to most NIMBY controversies. Moreover, it is nothing new that analytic models often fail to solve real-world problems. As Gillroy recognizes, cost-benefit analysis falls short in environmental problem solving. What we require now are precise and empirical arguments that show assurance-model strategies are more believable and more realistic than cost-benefit models. For real situations to follow the assurance model, we need evidence about the possibility of motivating persons to behave in cooperative ways. If Rabe's and Gillrov's Canadian case study about siting a hazardous waste facility is representative, then their conclusions about assurance-game models are correct. If their single case study is not representative, then their proposed model may be less promising than they believe. Regardless of which is the case, the book provides us with a heuristically powerful, concrete solution that can be attempted and tested in future conflicts over environmental risk. Moreover, apart from whether the assurance-game model will work in most cases of environmental conflict, Gillroy has done a great service by pointing out that successful models of conflict resolution (like the proposed assurance model) presuppose full disclosure of relevant risk information, unquestionable integrity on the part of all parties to the controversy, and great public trust. Whether or not the assurance model works, in clarifying it, Gillroy has done a brilliant job of exposing the most potent reasons for continuing environmental conflict and for lack of cooperation among parties. If he is correct, the conflicts come not so much from poor or incomplete science but from withholding information and lack of credibility and trust. He has produced a compelling argument for examining political and ethical, rather than merely scientific, components of environmental risk.

As a policy analyst, Gillroy provides a persuasive and clear dissection of collective-goods problems. His essays are among the best in the volume, not only because of the quality of the analysis but also because of their comprehensive survey of types of environmental values and the complexities of environmental risk. This particular asset of the volume makes it useful as a text. Yet another strength of the collection is its insightful and thoughtful treatment of some of the flawed market mechanisms for dealing with environmental risk.

Apart from questions about the real-world applicability of the assurance model, the main shortcoming of the book is that, despite the unity of the Gillroy essays, many of the other contributions in the collection are not tightly connected to each other. Although there are two general themes running throughout all the chapters, the diverse contributions to the book have no common, specific focus. For example, the Henderson essay, on flawed public understanding of science, is outside the general theme of the volume, as is the MacLean essay on conservation versus preservation. There is also some redundancy in the collection, particularly in the discussions of prisoner's dilemmas. Nevertheless, the excellent analyses by Gillroy and the volume's inclusion of original essays by some of the best persons working in the field-Kelman and Page, for example-make it an important book for anyone interested in environmental risks, political choices, and game-theoretic strategies.

University of South Florida

KRISTIN S. SHRADER-FRECHETTE

Politics, Society, and Democracy: The Case of Spain. Edited by Richard Gunther. Boulder: Westview, 1993. 272p. \$44.00.

The Return of Civil Society: The Emergence of Democratic Spain. By Victor M. Pérez-Díaz. Cambridge: Harvard University Press, 1993. 357p. \$35.00.

The two books under review here are quite different in scope, but they share a common interest in exploring the

recent history of Spain and the reasons for its successful democratization. The Return of Civil Society, by Victor Pérez-Díaz, is a book that can only be described as magisterial. It moves easily and successfully along the boundaries of history, political science, and sociology, presenting a carefully crafted argument about the democratization of Spain while reflecting intelligently and provocatively on many other subjects. Among these, the conditions for democratic development; the nature of the relationship between social institutions, market, and state; the changing nature of religiosity and the adaptive capacities of religious institutions; and the impact of neocorporatist or territorial arrangements (he refers to these as mesogovernments) on the efficacy of national governments.

Politics, Society, and Democracy makes a different kind of contribution to the literature. Ably edited by Richard Gunther and part of a four-volume festschrift in honor of Juan Linz, this book focuses on Linz's contributions to the study of Spain. Its chapters, written by former students and colleagues, testify to the breadth and intellectual rigor of his work, his collegial spirit, and his capacity (as José Cazorla puts it) to employ Spain as a "paradigmatic" case (p. 71). Although not entirely immune to the problems associated with edited volumes, it is an important book and helps us better understand not only the work of Juan Linz but also important aspects of the Spanish experience in the twentieth century.

Politics, Society, and Democracy is part intellectual biography, part political analysis. In part 1, Amando de Miguel paints an affectionate portrait of Linz, while Manuel Gómez-Reino and two others from DATA, S.A. (the social science survey research firm that Linz helped found) show the link between Linz the citizen and Linz the social scientist, between Linz's commitment to democracy in Spain and his use of Spain as a prism through which "to better comprehend the most important problems of the contemporary world" (p. 11). Miguel Jerez takes up a third dimension in the life of Juan Linz—his role in the development of the social sciences in Spain.

Part 2 focuses more directly on themes related to Spanish politics and society. Among the topics covered in its 11 chapters are a comparison of the labor movements in Spain and Italy (Malefakis), authoritarianism and its legacy (Cazorla), the legitimacy and meaning of democracy (Montero), the role King Juan Carlos played in the democratization process (Polodny), the role of business (Martínez) and labor (Fishman) elites, the evolution of the Basque party system (Llera), and health policy reform under the Socialists (de Miguel and Rodríguez). I should like to draw attention to those chapters whose themes relate closely to the issues discussed in the *The Emergence of Civil Society* by Victor Pérez-Díaz, namely, the role of societal actors and the cultural foundations of democracy.

The role of societal elites in the construction of Spanish democracy is the subject of the chapters by Martinez and Fishman. The Martinez chapter demonstrates the positive role that the business community played in the democratization process. His conclusions clearly support the argument that the diffusion of economic control is an important stimulus to democratic development. (My only quibble with this otherwise excellent chapter is that Martinez fails to analyze in much detail the political role of the banking sector. He is right to call the gran banca "more a polemical than an analytical concept"

[p. 118], but one does not need to have a particularly conspiratorial bent to assume it had an active hand in the disintegration of the UCD.)

Fishman covers the other side of the societal-industrial divide. His chapter is an excellent example of how to explore the differential impact that subnational differences and variations in social structure had on working class radicalism in Madrid and Barcelona. More relevant to our discussion, however, he demonstrates why radical working-class elites in Barcelona failed to retain their influence among a working class that was more moderate.

Cazorla and Montero touch on issues related to the cultural foundations of democracy. The chapter by Cazorla ("The Theory and Reality of the Authoritarian Regime, Thirty Years Later") is extraordinarily suggestive and useful. Not only does it discuss some of the debates surrounding the concept of authoritarianism, but it also explores the "residues" of franquismo, specifically the lingering distrust of politicians and the emergence of what Cazorla terms "mass-level clientelism" and the "collective patron" (p. 83). His conclusion is that "the rapidity of our political change has produced an asynchronism—the survival of the remains of an authoritarian mentality within a minority but visible sector of the population, combined with the inertia of important institutions and improvisation or a lack of scruples by some of their leaders" (p. 87).

By contrast, Montero offers a rather more optimistic assessment of the situation. Focusing on legitimacy and efficacy (two central concerns in the work of Linz), Montero analyzes the so-called desencanto of the late 1970s and early 1980s. He argues that despite lingering positive feelings about Franco (29% of respondents were "sympathetic" toward him in a 1982 survey), the legitimacy of the democratic regime was never in question. Among the chief reasons for this, Montero explains, were that Spaniards, having recently experienced a transition from authoritarian rule to democracy, could make quite "separate evaluations of system performance (efficacy) from support for the current democratic regime (legitimacy)" (p. 155). The outcome of the crisis of the early 1980s may have been partisan dealignment (or, as Samuel Barnes, Peter McDonough, and Antonio López Pina put it several years ago, "volatile parties and stable voters"); but there was (and has been) very little support for antidemocratic solutions or antisystem parties. Montero also advances a second line of argument, insisting there has been a "displacement of the traditional dichotomy liberty-equality by (a) new materialist-postmaterialist cleavage" (p. 166). There is certainly empirical evidence in this regard, but I think Montero might not stress the connections between these "new" values and the "residual" ones inherited from franquismo enough.

The debate over civil society and the cultural foundations of democracy are at the core of contemporary political science debates. And it is in this area that the other book under review here makes its most important contribution. The Return of Civil Society offers an absorbing alternative reading of how and why democracy came to Spain. The heroes of this tale are not the usual cast of the political elites or clase política. "Political transitions," Pérez-Díaz cautions, "can be reconstructed ex post facto as critical choices by the elites, but most often those choices are not so much deliberate calculations as belated reactions to ongoing processes the elites hardly understand, must less control" (p. 7). Indeed, when he reviews critical events (such as those of 1976–77), Pérez-

Díaz emphasizes not so much what the elite did but how the public responded. The new political rules, he argues, were "not so much invented *de novo* as translated, so to speak, from (the) meta-rules of social, economic and cultural life" (p. 28).

For Pérez-Díaz, the "emergence of democratic Spain" is about the "return of civil society," that is, the development of "social institutions such as markets and voluntary associations and a public sphere which are outside the direct control . . . of the state" (p. 57). It was in the civil society, with the trauma of the Civil War and the experience of Francoism as primary points of reference, that a democratic tradition was invented, whence it was eventually transported to the political sphere.

In seeking to explain the emergence of democracy in Spain, Pérez-Díaz finds insufficient those arguments that center either on structural variables (be they economic or cultural, domestic or international) or on elite choices-not that he dismisses those variables, for the reader will find a sympathetic and knowledgeable discussion of their explanatory strengths and weaknesses. (Particularly notable is his discussion of the impact that international variables had on the democratization process. Those who are familiar with the transition literature know how often this factor is ignored.) Rather than dismiss structural or elite variables, Pérez-Díaz proposes to shift their terms of reference; to approach structural factors in terms of the traditions, rules, and institutions at their core; and to view actors "less as choice makers than as rule followers (or as rule deviants or rule breakers)" (p. 26).

It is from this perspective that Pérez-Díaz examines the role of societal groups and institutions (business, labor, and the Church) in the "emergence of democracy" in Spain. His conclusion is worth quoting at length:

The effect of businessmen and trade unions has been greater and more constructive than the rather more modest influence exercised by intellectuals. The image politicians like to put forward of themselves as holding together the world which is breaking apart seems plausible when one compares them with the cultural groups, but much less so if they are compared with socioeconomic groups. The market and industrial development have been important binding forces throughout the Spanish territory for the last century and a half. Business and trade unions have been powerful centripetal forces, tending toward the integration of the national community (p. 209).

The Return of Civil Society is more than just about why democracy "emerged" in Spain. It is also about examining the challenges that democracy confronts (there and elsewhere). From this perspective, Pérez-Díaz explores two sets of issues: (1) the nature of mesogovernments (neocorporatist arrangements and territorial formulas of various types) and the "problematic effects" these structures may have on governability and on the economy and (2) how the nature of the relationship between workers and unions has changed, especially with the breakdown of the post-1945 "social compromise" and the growth of a "rational, instrumental, or experimental attitude" toward unions and parties (pp. 193, 284, 298 and chap. 4). Addressing this last theme from the same "societal" perspective he employed in discussing the "emergence" of democracy, Pérez-Díaz argues that given the "moral and cognitive development" of the workers, "unions and political parties could not but

Ĺ

(have) followed a strategy of *de facto* accommodation with capitalism" over the past several decades (pp. 311–12).

capitalism" over the past several decades (pp. 311–12). The Return of Civil Society is an eloquent call for "bringing society back in" to the study of comparative politics. Although not necessarily agreeing with everything Pérez-Díaz says, the reader will gain many insights from it. My only complaint pertains to his concluding chapter. I wish he had connected his earlier discussions of clientelism and political corruption more clearly with his later argument about workers, unions, and the social pact. This I say primarily because I wanted Pérez-Díaz to expand on this issue and its relation to governability. Pérez-Díaz has written a superb book that will make a significant contribution to the ongoing debate about the process of democratization.

EUSEBIO MUJAL-LEON

Apple of Gold: Constitutionalism in Israel and the United States. By Gary Jeffrey Jacobsohn. Princeton: Princeton University Press, 1993. 284p. \$39.50.

Once dismissed as an artifact of eighteenth-century Europe, constitutionalism seems to be enjoying a certain renaissance. New or revised constitutional texts, inescapably accompanied by debate over more broadly constitutive matters, now figure prominently in dramatic political transformations nearly everywhere—all over the post-communist region, in South Africa, in Israel and Palestine, in India and in Canada. Since this new round of constitutional politics follows on the heels of the recent bicentennial of the American constitutional text and Bill of Rights, it is not surprising that constitutional scholarship is blossoming. Gary J. Jacobsohn's book is among the most astute and far-seeing of the current batch of books on comparative constitutional issues. In fact, it is hard to overstate the importance of his book because its significance transcends its immediate subject. He compares Israel and the United States, but his comparison speaks powerfully to the identity crisis of liberalism in a multicultural era.

Liberalism has been entwined with constitutionalism ever since they emerged in the eighteenth century as apparently fraternal twins. So much have their careers been linked that the term "liberal constitutionalism" is often taken to contain a superfluous adjective. But while constitutionalism-somehow "the rule of law" as against "the rule of men"—is riding high, liberalism is under siege. Non-western intellectuals join western postmodernists to attack the notion of individual autonomy rights as a form of naive universalism, and to unmask the ethnic and moral "neutrality" of the liberal state as a covert form of coercion. And many states now face new demands for group rights and for state patronage of religious or ethnic identities. These demands arise out of increasingly multicultural conditions everywhere, suggesting that the very social pluralism which was supposed to necessitate liberalism in the first place now threatens to strangle liberalism with its own equality principle. In the American heartland of liberalism, for example, the crisis is visible in the Kiryas Joel case now before the U.S. Supreme Court. The case involves a challenge to a public school district specifically created to provide handicapped education to a Hasidic Jewish community in New York state. It forces the Clinton Justice Department (which must weigh in before the

Court) to choose between two parts of its own soul—between liberal multiculturalism on the one hand and liberal religious neutralism on the other.

With Jacobsohn's help we see how vastly different such questions appear when considered from the perspective of Israeli constitutionalism, which he calls an "alternative pluralism." In the U.S., pluralism is said to require the state (and its schools) to be scrupulously neutral among rival sub-communities and their values. In Israel, pluralism requires the state to accommodateand empower—the cultural institutions of various religious sub-communities, even while it publicly affirms the centrally Jewish identity of the polity as a whole. The American rule of religious neutralism, if transplanted unmodified, would shatter the identity of the Jewish state, and would be regarded by most Israelis (Jew and Arab alike) as a homogenizing doctrine corrosive of the actually existing plurality of communities. Americans may find such thinking incongruous. But in a brilliant move of internal comparison, Jacobsohn points them to the one "glaring exception" to America's liberal constitutionalist norms: the native American tribes (p. 18). Based on early treaties and their claim to primeval nationhood, the tribes, as communities, enjoy constitutional recognition in a manner more consistent with the Israeli than the American brand of constitutionalism. Most revealing was the 1968 "Indian Civil Rights Act," opposed by native Americans as an assimilationist instrument whose exaltation of individual rights would erode tribal cohesion. Jacobsohn notes that the final version of the Act pointedly omitted any no-establishment-of-religion clause, since the integration of spirituality and public order often constitutes tribal identity. As Jacobsohn says of Israel, such communal autonomy "supports political stability by providing non-dominant (and inassimilable) groups with mechanisms that enable them to minimize the effects of their inferior position in the larger society" (p. 35).

Liberal doubters might dismiss the native American case as a constitutional regime's pragmatic compromise with a marginal anti-constitutionalist sub-community. The bigger question, then, is whether such arrangements qualify as a version of constitutionalism when, as in Israel, they mark the scheme as a whole. Does the Israeli experience represent its own principled form of constitutionalism, as Jacobsohn seems to hold, or does it qualify only to the extent that it conforms to the norms of American-style individualist liberalism, with deviations regarded as anti-constitutionalist malfeasance?

The State of Israel does not, of course, have a formalized constitutional text; it has an incomplete set of "Basic Laws" on different subjects passed by the Knesset, and no list of constitutionally protected individual rights. In the absence of a definitive document, the 1948 Declaration of Independence has loomed large. Along with the 1950 Law of Return, the Declaration continues to define the Israeli policy, and under its terms the Israeli Supreme Court has developed a practice of judicial review that includes substantial protection for individual civil liberties. Score one for Israel, at least by American criteria.

Yet Jacobsohn does not gloss over the lack of a text. Creating a unified text is a daunting task, he explains, in the face of the tensions which comprise the Israeli polity. For Israel is constituted by its dual commitments—announced in the Declaration—to being a Jewish state and to ensuring equal rights and freedoms for "all its

inhabitants." Jacobsohn calls this "a mix of universal and particularistic principles" (p. 237). In several rich chapters, he examines the political and jurisprudential consequences of this mixture. He examines the recent controversy over amendments to the Law of Return (Who is a Jew?). He shows how the Israeli Court's dominance has been curtailed by the mix of constitutional principles just as much as by the tradition of parliamentary supremacy. He reviews education policy, national security censorship, and free-speech jurisprudence, most intriguingly the Kahane case and the ban on the showing of the film *The Last Temptation of Christ* (banned briefly out of respect for the sensibilities of Israel's minority Christian community).

Jacobsohn shows how ambiguity characterizes Israeli jurisprudence in all of these areas. He is far from portraying Israeli law as consistently communitarian or illiberal; by his own account the outcomes often match those of American courts. But with careful attention to nuance, he demonstrates how, even in those cases which seem to track most closely with American jurisprudence, there remains among Israeli judges a principled reticence to embrace the liberal view wholesale, and a consistent recognition that Israel's Jewish identity, and its fragile cultural context, make it unwise—even unconstitutional—to replicate the jurisprudence of individual autonomy rights.

In his final chapter, Jacobsohn broods on the theoretical implications of his comparison. He struggles to articulate the meaning of constitutionalism independent of liberal criteria. As illuminated by the Israeli experience, constitutionalism "is definitely not *illiberal* politics," he says, "but its conceptualization should not be confined only to polities that embody an unambiguous, robust commitment to the ends of liberal democracy" (p. 237). I think his own remarkable argument suggests that we go further still. He makes me wonder whether a mixed constitution of the Israeli variety isn't in fact more authentically constitutionalist than *any* of the unmixed varieties which (like "liberal constitutionalism") do not obstruct the despotism of their own principles.

GRAHAM WALKER

Decision Making in the European Community: The Council Presidency and European Integration. By Emil J. Kirchner. New York: St. Martin's, 1992. 165p. \$24.95 paper.

The entry into force of the Maastricht Treaty on European Union on 1 November, 1993 came after much delay, including a razor-thin referendum vote in France and two such votes (the second was to deal with an initial rejection) in Denmark. The treaty has introduced a new level of complexity (some would prefer to characterize it as a new level of confusion) into the nomenclature, decision-making process, institutional framework, and relations between Brussels and the national governments of the 12 European Community member states.

The European Union is now the umbrella term referring to the already-existing "three-pillar" structure of the European Community (the European Coal and Steel Community, European Economic Community, and European Atomic Energy Community) and the two new "pillars" constructed by the Maastricht Treaty: the Com-

mon Foreign and Security Policy enhancing the new European Political Cooperation process and certain areas within the domains of the justice and interior ministries (especially greater collaboration/cooperation between police and other authorities on crime, terrorism, and asylum-immigration issues). The European Community still continues to exist as a separate legal entity within the broader framework of the Union; but, in view of the difficulties of delineating what is strictly EC or Union business, the term of choice is now the European Union, rather than the more limited Community, as contained in the title of this book.

Compounding this complexity, there exist two Councils: (1) the Council of Ministers of the European Union (formerly "of the European Communities") comprising (usually but not exclusively) the foreign affairs ministers of the 12 member states and (2) the European Council, comprising the heads of state or government of the member states. The "ministerial" Council meets quite regularly (about 80–90 times a year), whereas the "prime-ministerial" Council meets at a biannual summit. Each Council has its "Presidency"—a rotating (sixmonth term) chief presidency officer or "President-in-Office."

At the level of the European Council, the head of state or government of the member state holding this rotating six-month office acts as host, chairs the meeting, sets the agenda, acts as official spokesperson, and (depending upon a series of conditions) may be able to set the tone and nature of Union activities for the six months and initiate various public policy proposals. At the level of the Council of Ministers, the foreign minister (or another portfolio, depending upon the specific agenda) of the member state holding the rotating presidency plays a leading role.

Emil J. Kirchner, Director of the Center for European Studies at the University of Essex and a long-time observer of European Community/Union politics, has written a timely and important evaluation of the decision-making process at the level of these Council Presidencies and the offices' role in, and impact on, the European integration process, the management of international cooperation, and institutional community building.

The author, through a judicious use of archival material and personal interviewing, along with an analysis of decision-making theory and the various theoretical approaches to political integration, examines how the Council Presidencies impinge on the integration process, especially since the Single European Act and the two 1991 Intergovernmental Conferences (on the European Monetary Union and European Political Union). Assessing the balance and distribution of power between the actors at the Union and national levels, the author consistently refers back to the basic question, Is the Council Presidency primarily a device to maintain and strengthen "national control" over decision making within the European Union, or do the offices go beyond national prerogatives and enhance integration?

The negotiations that led to the Single European Act and the two Intergovernmental Conferences are interpreted by the author as requiring a new approach to, or understanding of, the relationship between the Union-level institutions and the member states. The author concludes that European Union decision making is not solely a transfer of powers from the national capitals to Brussels but also a sharing of competencies between

national and Union institutions and a "pooling of sovereignties" among the member states that evokes, at least for me, the American phenomenon of "cooperative federalism."

Kirchner has succeeded in presenting a most readable assessment of the dynamics of European integration, but this success has, in a sense, limited the book's overall attractiveness. *Decision Making in the European Community* is highly useful and informative to the professional well versed in the intricacies of the European Union and to the advanced graduate student, but it is not recommended for the general student, the public, or as a text.

LEON HURWITZ

Party Policy and Government Coalitions. Edited by M. J. Laver and Ian Budge. New York: St. Martin's Press, 1992. 448p. \$59.95.

Legislatures in the Policy Process: The Dilemmas of Economic Policy. Edited by David Olson and Michael Mezey. New York: Cambridge University Press, 1991. 221p. \$39.50.

The two volumes reviewed here report findings and conclusions from ambitious research projects investigating aspects of policy making in a cross-national setting. In both, the research emanates from on-going collaboration by international teams of scholars, the participants individually expert in the politics of particular countries and guided, collectively, by cross-national research strategies. The editors lay out first the theoretical and methodological approach of the research, followed by applications in various national settings. They conclude with a chapter summarizing results across cases. The projects are differentiated both by institutional focus and the role assigned to policy in the design of the research. The Laver and Budge collection seeks to determine whether "policy matters" in the decisions made by parties to participate in the formation of governing coalitions. In contrast, the Olson and Mezey anthology explores ways in which legislatures may independently influence the making of economic policy in institutional contexts where political executives have become preeminent. The commitment to cross-national comparison suggests that the goal of both projects is to establish theoretical propositions by empirical generalization.

The projects depart from quite different theoretical and methodological traditions. The Laver and Budge work is rooted in three decades of formal and empirical work investigating coalition processes and behavior. While a certain mathematical elegance attaches to the coalition theories that have been developed, attempts to verify propositions empirically have generally produced disappointing results. Laver and Budge argue that this weakness stems from a general failure to take sufficient account of contextual constraints in adapting theoretical concepts for empirical testing. Thus they develop two expectations regarding coalition behavior in cabinetforming contexts: that the motivation of actors (parties, generally) is "policy seeking" rather than "office seeking," and the governments that form will be "policy viable" (not constrained by numerical criteria). Drawing upon cross-national longitudinal data coded from party manifestoes and coalition policy declarations, a number of hypotheses regarding these expectations are tested.

Lacking the tradition of formal theoretical work that supports the coalition policy research, the Olson and Mezey project relies upon the largely descriptive literature on comparative legislative behavior to generate a series of hypotheses designed to investigate the ways in which legislatures matter in the making of domestic economic policy. With policy activity (sometimes, policy participation) defined as the dependent variable, 16 hypotheses are stated. The hypotheses are grouped into three general categories to focus on particular contextual variables believed to condition legislative policy activity. These include extra-parliamentary institutions and actors, the internal structure of legislatures, and particular attributes of economic policies. The authors of individual chapters discuss a variety of specific policies and policy processes within the general framework established by this set of hypotheses.

With respect to the establishment of cross-national empirical generalizations in their areas of investigation, both works are, overall, disappointing. This is especially the case with the Olson and Mezey study. Their research design is explicitly and self-consciously structured as a linear regression problem where the objective is the cross-national explanation of variance in legislative policy activity/participation. The hypotheses they advance state a series of bivariate relationships suggesting that their testing will indicate an appropriate multivariate equation explaining legislative policy activity. However, no set of cross-systemic (equivalent) indicators is developed to measure the variables stated in the hypotheses that guide research nor is there a multivariate equation that emerges from the within-country assessments of the bivariate relationships. As such, the descriptions and analyses presented in the individual chapters of this work are not generalizable across cases.

The Laver and Budge effort, in general, avoids this problem. The research design calls for the creation of policy spaces from data sets that use common categories for coding party election manifestoes and government policy declarations, over time, in each of the countries considered. These data are reduced by factor analytic techniques to produce for each of the countries studied a series of policy maps locating the major parties in both one-dimensional and twenty-dimensional policy space. The policy "distance" separating the parties then provides the basis for testing a number of hypotheses relating to coalition formation and policy payoffs. While analysis is confined to individual systems (countries), the design of the research allows results to be directly comparable across countries and across time.

The problem with the Laver and Budge project lies in interpreting the results that are produced; they are either equivocal or disconfirmatory of initial expectations. Indeed, policy-based predictions of coalition formations are poor overall and the policy preferences of governing parties are not reliably reproduced in government policy declarations nor does membership in a cabinet guarantee that government policy will reflect party preferences better than being in opposition. More to the point, Laver and Budge find no pronounced cross-national patterns from the country analyses regarding the specific expectations stated in the research design. Thus, it is not that the results are not generalizable, it is rather that they do not generalize. Since it is scarcely conceivable that policy "doesn't matter" to parliamentary actors when they bargain over membership in government and making policy, the lack of

consistent results is discouraging. One suspects, as do the editors themselves, that the main difficulty lies in the analytic and methodological choices that were imposed in executing the research design.

The two projects reviewed here point to a central dilemma of comparison, namely, eliminating sources of residual variation in hypothesized relationships. In a classical formulation more than two decades ago, Przeworski and Teune noted the threat to scientific generalization that is inherent in reliance upon idiosyncratic "country factors" to explain cross-national political phenomena, and they exhorted us, where possible, to substitute variables for country names. Thus, to say that an hypothesized relationship holds except in countries X and Y, where some other result is observed, does not invite us to explore the nature of deviance in such cases so much as to search for common (universal) factors that account for cross-national variation. This methodological commitment defines the role of "country experts" in cross-national research projects: namely, to aid in establishing the equivalence of indicators that are selected to measure theoretical concepts. The object is to moot cultural and institutional particularities by controlling their effect, allowing empirical generalizations to be established.

Without a guiding theory of legislative policy influence, the Olson and Mezey project relies upon its contributors to give country-specific interpretations of the policy process. While the research is loosely organized around a series of hypothesized relationships, no elaboration of basic concepts to establish common categories for analysis seems to have been undertaken, nor is there a consistent measurement strategy applied to the various country analyses. In short, no attempt is made to establish cross-national equivalence for either basic concepts or their indicators. The theoretical and methodological weaknesses of this project reduce the role of the country experts to that of providing their own descriptions of national practices, and herein lies the value of the work. To a greater or lesser degree, the various chapters of this volume provide contextual detail and a qualitative understanding of the institutional role of legislatures in the policy process, helping to build a descriptive base for the eventual development of empirical theory.

For Laver and Budge, the guidance provided by traditional coalition theory is at the outset judged deficient for neglecting the influence of contextual constraints operating in national settings. Thus for example, the central theoretical concept of "winning coalition" is replaced in this research by the contextually determined notion of a "policy viable" coalition. This reformulation, produced jointly by the editors and the team of country experts, seeks to nullify the effect of idiosyncratic system factors by creating a theoretical concept that is equivalent cross-nationally, as Przeworski and Teune would have advised. In spite of such efforts, however, the importance of the Laver and Budge project is vitiated by the failure of cross-national patterns to emerge from empirical analysis. The consequence is that the explanations of policy relevance for behavior they offer is significantly dependent upon the judgment of their country experts regarding the influence of system specific factors

The projects considered here begin, respectively, with the belief that "policy matters" or "legislatures matter." It would, however, appear more to the point to say that "country matters." The value of both works, then, is found in gaining an appreciation of the ways in which similar phenomena are manifested differently across countries. Both works document the importance of contextual constraints on political processes and behavior, and (in the Laver and Budge project particularly) point to the difficulties they pose for the establishment of cross-national empirical generalizations. If, as was observed earlier in this review, we can evaluate the results from these projects to have been disappointing, it is as pertinent to observe that cross-national research is not simple. These and other projects that involve international scholarly cooperation continue to be urgently needed in the effort to generalize knowledge of important political processes and behavior.

University of Wisconsin, Milwaukee Eric C. Browne

Germany Divided: From the Wall to Reunification. By A. James McAdams. Princeton: Princeton University Press, 1993. 250p. \$29.95.

German Unification in the European Context. By Peter H. Merkl. University Park: Pennsylvania State University Press, 1993. 448p. \$65.00 cloth, \$18.95 paper.

Perfect hindsight has led many scholars and practitioners alike to conclude that Germany's division was always destined to be temporary. Politicians in Bonn wrangle over the proper share of credit for having pursued the strategy that made reunification happen. A. James McAdams reminds them all just how stable the country's division into two separate states appeared for several decades. He gently chides many for conveniently forgetting that much scholarship, as well as an entire generation of diplomatic activity, rested on the premise that that division would last. His book's central aim is to explain how partition came to be accepted even (or especially) by Germans themselves.

McAdams suggests that domestic political processes in Bonn and East Berlin, however different in character, both contributed significantly to this gradual process of adaptation to the status quo. McAdams defines process broadly to include the interaction of a variety of domestic political factors, including the interests and goals of top government and party leaders.

Germany Divided advances decade by decade through to the 1990s, though the era that McAdams treats in greatest depth is the 1980s. In each section, he pays detailed attention to the pronouncements and actions of political elites in both German capitals. The author shows how Bonn and East Berlin each gradually abandoned the belief that national division could be ended on terms most satisfactory to its own vital interests.

McAdams's work rests on a wealth of research and is thoroughly documented. One of the book's most important sources is a set of interviews that the author conducted with top figures from the former East German establishment as part of an oral history project on that regime deposited at Stanford University's Hoover Institution.

Germany Divided makes another unique contribution to scholarship on the preunification period by demonstrating quite convincingly just how much of what led to that event was inadvertent, even a result of miscalculation. The East's often overconfident and panicky yet always myopic communist elite was busily digging its own

grave by loosening, tightening, and again loosening emigration or travel restrictions. And West German political parties, understandably anxious to preserve a sense of stability and normalcy (which was also popular with voters), placed a premium on the "doable" things: while describing the division itself as deleterious, they put ideas of unification on the back burner in favor of practical cooperation with the regime in East Berlin. Like a budget deficit, national division had many sincere critics, but almost all found a way of living with it.

Many scholars of former East Germany have long held to the view that the Communist regime generated some legitimacy, making it less than totally dependent on Soviet military support. Their critics have contended that this premise blurred the fundamental distinctions between a police state and a liberal democracy, thus obscuring the major reason for the East's total collapse. Germany Divided does devote equal attention to domestic political processes in the two states but also shows how those features which set them apart also affected relations. Nor does its thesis necessarily view domestic politics as the sole determinant of each country's policy toward the other in the years before 1989. Whatever view one takes of the highest-charged scholarly debate to emerge from unification, McAdams's careful, thorough analysis contributes in a significant way to a better understanding of the dynamics that moved German-German relations for decades.

Where McAdams focuses on the impact of one set of factors in the shaping of policy during past decades, Peter Merkl's study, German Unification in the European Context, offers a broad examination. While that might make for a somewhat less compact thesis, the book more than compensates with a breadth of scope encompassing past and future—as well as domestic and international—dimensions of the German Question. Moreover, Merkl frequently returns to a basic, underlying theme, namely, his view that modern Germany's stake in a prosperous, stable environment should reassure those given to concern about unification and its impact on Europe. He repeatedly stresses, for example, that any signs of nationalistic euphoria during the unity drama were restricted almost exclusively to the older generation, while even "flag-waving patriotism" of the American variety has remained rare among younger Germans.

Unlike Elizabeth Pond's Beyond the Wall (1993), Merkl's book is not an analytical narrative account of events in 1989-90 but a detailed interpretation of unification. It is structured thematically, though the treatment of each separate topic moves in a generally chronological fashion (at the cost of some unavoidable repetition). In this manner he covers the general erosion of the Soviet bloc, the rise and decline of communist East Germany, the West German response to the historic opportunity of 1989-90, the constitutional order of united Germany, the economic problems associated with unification, the reaction of other countries to this sweeping change in the structure of Europe, and finally the role this "new" country will play in the continent's (d)evolving security regime. Toward the end, the author credits Chancellor Helmut Kohl "for steering the country through the shoals of reunification" (p. 398), contending that he had no choice but to proceed hastily lest international and domestic resistance (including the reluctance of taxpayers to foot the bill) mounted.

In over four hundred pages, few issues are left untouched; the author provides a wealth of documenta-

tion, including, above all, survey data on almost every question treated. At the same time, he does not hesitate to enrich his analysis with personal reflections and an occasional poetic turn of phrase, such as the suggestion that a few guard towers on the old German–German border be preserved "as a monument to the living and a reminder that one person's myth can be another person's dungeon" (p. 421).

To be sure, perhaps not all readers will be fully reassured about the future of German politics especially in light of a recent upsurge in right-wing radicalism. Others might remain unpersuaded by the slightly overdrawn contrast between Anglo-American jingoism and idealistic German pacifism. Yet this book makes a major contribution to understanding the multidimensional character of the German unification process and its various, lasting implications. In particular, the author makes a convincing case that (appearances to the contrary) unity did not merely represent an extension of West German institutions and practices to the East: in almost all respects, much remains that divides these two halves of the country, including (as Merkl again documents with survey data) a mutual antagonism in popular attitudes across the old border. The author leaves a clear impression that ending Germany's partition was the easy part; overcoming the effects of four decades spent in entirely different political and social systems is a task that will take much more time to complete, with complete success by no means assured.

Aside from the general topic of Germany unity and quality of scholarship, these two books share certain other similarities. To be sure, neither author is primarily concerned with the German issue's relevance for broader theoretical issues in comparative politics or international relations. Yet both emphasize the degree to which politicians (above all, in West Germany) internalized the very concerns about their country's impact on European stability that long made neighboring states worry about unification. That phenomenon may ultimately be the one legacy of Germany division that ensures the success of German unification.

CLAY CLEMENS

The Sacred Cause: Civil-Military Conflict over Soviet National Security, 1917–1992. By Thomas M. Nichols. Ithaca: Cornell University Press, 1993. 259p. \$32.50.

Like many other features of the Soviet political order, Soviet civil-military relations have recently attracted new scholarly scrutiny. Even during the comparatively stable Khrushchev and Brezhnev eras, Western analysts' disagreements about the nature of Soviet civil-military relations had important practical implications. But the participation of senior Soviet officers in the abortive August 1991 coup and the role of military units in the October 1993 showdown between President Yeltsin and the Russian parliament have given these long-standing debates greater currency.

In The Sacred Cause Nichols makes a significant contribution to a better understanding of recent trends in Soviet and Russian civil-military relations. Although the book covers the entire span of Soviet history, most of it deals with the period from Khrushchev through Gorbachev. Drawing on a wide range of Russian-language sources, Nichols concentrates on the development of

military strategy, weaving into the account a substantial amount of information about other topics. He rightly pays close attention to the civil-military contest over the proper relationship between "military science," a domain in which the military was acknowledged to have special expertise, and "military doctrine," in which the Party traditionally claimed the final say.

The book's main thesis is that civilian Party officials and Soviet military officers were divided by conflicts inherent in the Communist system. Due to the absence of any meaningful Soviet constitutional tradition and to the Party's formal advocacy of transcendent political principles, civilian leaders could never establish unconditional control over the military. In the terminology of Samuel Huntington's The Soldier and the State (1957), Party leaders resorted to "subjective" rather than "obiective" means of control. That is, they relied on such devices as police surveillance, political criteria of promotion, ideological indoctrination, and occasionally promulgation of military policy by Party fiat, rather than on an political-military division of labor that granted officers full professional autonomy in exchange for a military commitment not to intervene in politics. This approach, however, had unintended consequences. In the twilight of Soviet power, an officer corps steeped in Marxism-Leninism was pitted against an increasingly pragmatic Party elite. The Army became "the watchdog of the Party rather than vice versa," producing a lasting confusion of military loyalties that "may be among the greatest threats to the emerging post-Soviet democracies" (pp. ix-x).

This interpretation is novel and thought-provoking. It is a useful attempt to evaluate Soviet civil-military relations by comparative standards of constitutional loyalty not generally applied to the USSR by Western analysts. Prof. Nichols underscores the mingling of Soviet Party and military officials in decisionmaking bodies such as the Party Central Committee-and, one might add, in the Party Politburo after 1973. The author could have further buttressed his argument for the Party's reliance on subjective mechanisms of control by giving fuller attention to the use of the secret police to prevent potential challenges from the military. The blurring of the institutional boundaries between the civilian and military realms has become especially pronounced in the post-Soviet period. Due partly to a faulty understanding of the concept of the separation of powers (at least one-sixth of the deputies in the lower house of the new Russian parliament are employees from executive government agencies) military officers have been elected to legislative bodies and have plunged into bitter debates about Russia's socioeconomic crisis.

Although Nichols is right to note the Soviet precedent for this post-Soviet blurring of civil-military boundaries, the depth of the military's actual involvement in civilian matters before the late Gorbachev years remains debatable. In my opinion, the author's general depiction of civil-military relations does not take adequate account of the substantial variations that occurred during the Soviet era, even though his historical exposition notes these variations. For example, he states that the military had a predominant role in the formulation of military doctrine in the 10 years after 1925 and in the 18 years of Brezhnev's rule, which together amount to more than one-third of the history of the USSR. In addition, the book's empirical focus on military policy—the domain in which uniformed officers had the most legitimate

grounds to question the judgment of party leaders—makes it hard to assess the degree to which military men actually staked out positions on civilian matters. The most senior commanders undoubtedly had opportunities to "log-roll" on civilian issues during Central Committee and Politburo meetings, and in the early Stalin era a few senior commanders registered objections over the disruptive manner in which agricultural collectivization was implemented. For most of the Soviet period, however, the public pronouncements of senior officers focused almost exclusively on military issues and gave few indications of efforts to influence decisions on non-military matters.

Although this pattern changed in the late Gorbachev years, it is questionable whether national security policy, undeniably the source of sharp disagreements, became the most important bone of contention between Party leaders and military men. To judge by the timing, preserving the Soviet state against the risk of internal collapse was the issue that propelled many senior officers into outright defiance of Gorbachev in 1991. Differences over external threats probably played a secondary role in precipitating military involvement in the attempted coup. In addition, the concept of an ideologically indoctrinated military establishment does not capture the splits which had riven the officer corps by 1991 and which Nichols himself notes in passing. If the 1990 voting behavior of various military delegates in the Russian legislature is any guide, many senior commanders remained loyal to Marxism-Leninism, but many middle-rank and especially junior officers were hostile to Marxism-Leninism (as were a surprising number of low-level Party officials). Adherence to Marxism-Leninism among senior commanders helped trigger the 1991 coup attempt, but disbelief in Marxism-Leninism among other members of the officer corps helped defeat it.

Whether the reader accepts all the propositions contained in the Sacred Cause, the book makes a substantial contribution to reassessing the dynamics of the Soviet system and the implication of those dynamics for current upheaval in Russia. Scholars interested in such issues will read it with profit.

Bruce Parrott

Citizens, Political Communication, and Interest Groups: Environmental Organizations in Canada and the United States. By John C. Pierce, Mary Ann E. Steger, Brent S. Steel, and Nicholas P. Lovrich. Westport: Praeger, 1992. 256p. \$47.95.

This work is self-consciously directed at addressing in an empirical way an important normative issue in democratic theory: How are citizens to face the mounting informational challenges posed by policy issues in "postindustrial" society? Specifically, they ask, Do interest groups help citizens meet the challenges of scientific and technical complexity effectively? The authors claim that they do. Unfortunately, their data fall very far short of establishing that claim. The authors show rather convincingly that environmental interest groups in Canada and the United States are important information sources for both policy elites and interest group members. But they have failed to build into their study any measure of effective communication and so cannot equate desire for information or information per se with adequate

information or a reduction of complexity. The reason for this gap is that the authors' democratic instincts are too deeply rooted in an economistic model of citizenship. Hence, more (information) is better: the citizen-as-information-consumer demands information; interest groups supply it; ergo environmental groups are good.

supply it; ergo environmental groups are good.

The study's fundamental thesis is that "environmental interest groups may act as a unique mechanism for assisting democratic publics in dealing with their need for help in evaluating and employing scientific and technical policy-relevant information" (p. 106). A secondary thesis—which unfortunately occasionally threatens to overwhelm this focus—is that political culture influences the functioning of political institutions (in this case, interest groups). The latter thesis is born out by the analysis in a rather straightforward way; not so the

work's primary thesis.

The authors' central thesis, rephrased toward the end of the work, is that "interest groups in both the United States and Canada have the capacity to assist citizens in coping with the problem of the technical information quandary" (p. 186). This thesis is supported by three separate findings: (1) at the macro level, the authors discover some convergence in political culture, which they believe suggests "a common potential for having interest groups play an important political communication role in linking contemporary citizens to the public policy process"; (2) at the micro level, individuals differentiated between different groups as sources of political information and identified information as the primary motive for membership in environmental interest groups; (3) at the level of group processes, environmental interest groups were found to "rely extensively in carrying out their activities on the communication of policy-relevant information to their members and lay citizens" (pp. 176-77, 186). The cross-national survey data, supplemented by elite interviews with environmental activists and policymakers, appear to support these three propositions. The problem is that these propositions do not themselves add up to the book's basic thesis.

If the authors wish to equate the citizen's need for information with "a preference for information"-as they often appear to do (pp. 93, 97, 118, 150)—then one cannot speak of interest groups' doing anything more than gratifying an information itch. Talk of "effectiveness," "dealing with complexity" or "coping with complexity" all becomes synonomous with the instrumental delivery of utility-as-information and interest groups are simply (information) satisfying or not, nothing more. Fortunately, the authors do not really believe in this notion of a free market of ideas. In several places, they suggest that there is more to political communication than informational hedonism. For example, toward the end of the book, they note that interest groups may assist individuals learn by "cue-giving, resource-pooling, and influence-exerting activities" (p. 186). The problem is that these activities are not scrutinized here, much less tied to any explicit theory of learning. Nor, it might be added, are these tied to any explicitly democratic theory, either. (Does effective communication require any communication from the citizen to the interest group? What kind?) One finishes this book impressed by the empirical research and buoyed by the findings but wondering just what they mean. "Interest groups can get the information job done," the authors argue. But just what is information? And what is getting the job

Although the authors' theoretical grasp exceeds their empirical reach and although their argument is weakened in several places by a lack of conceptual clarity, there is much to commend in this volume: if it attempts to say more than it should, what it does say is important and stimulating. It matters a great deal that citizens' relationship to interest groups appears to be motivated, above all else, by a desire to seek information. If the authors stray beyond the data, they also take us into interesting and even provocative terrain. And if they fail to settle the important issue they take up, they at least take us some of the way there and point to the next step. Interest groups process a lot of information: But how well do they learn? How well do they teach?

ADOLF G. GUNDERSEN

Red Sunset: The Failure of Soviet Politics. By Philip G. Roeder. Princeton: Princeton University Press, 1993. 317p. \$49.50 cloth, \$16.95 paper.

Accounts of the political system of the USSR have alternated between emphasizing its routinized, bureaucratic character and considering it anarchic, potentially unstable, and prone to personal dictatorship. In the late 1970s, Western analysts became increasingly aware of the substantial decline in the regime's performance, because the enfeebled party leadership was increasingly hostage to the great bureaucracies that the regime had created.

In Red Sunset, Philip Roeder renews this line of argument. He finds that the regime grew stagnant because of the strength of the political ties connecting the top party leadership with the powerful bureaucratic interests represented in the Central Committee of the Communist party. He argues that past accounts have paid too little attention to the party General Secretary's dependence upon a base of support in the party machine, the military, the state bureaucracy, and other "second-tier" interests. He advances a concept of "reciprocal accountability" that, he believes, was implicit in the original requirement of the Bolshevik Revolution to delegate power to perform specific functions to bureaucratic and regional power centers. The Stalin period represents an aberration from this "constitution," according to Roeder; but immediately after the dictator's death, Stalin's successors restored the older collective leadership model. Ultimately, however, that very model became an obstacle to deep reform, because the rulers could not introduce significant redistributive change without jeopardizing their own political coalition. As a result, the system lost its capacity to maintain itself. Gorbachev's radical reform efforts simply proved the intrinsic incapacity of the system to preserve itself through democratization: a successful balancer at the outset, Gorbachev finally provoked his allies both on the Right and the Left to abandon him in 1990-91.

Roeder's account has a number of strengths. It provides a theoretically reasoned interpretation of the development of the Soviet political system, which accommodates both the apparent stability of the Brezhnev period and the rapid dissolution of the union in 1991. Moreover, he offers three case studies to demonstrate how Soviet coalition politics affected, and was affected by, policy decisions. The book also has the ambitious objective of proving the utility of a neoinstitutionalist perspective for the study of authoritarian regimes,

where their application has been inhibited by the fuzzy, tacit, and arbitrary character of rules and procedures governing political life. In a sense, the book stands the usual problem of social choice models on its head: instead of asking how majority rule can yield stable policy outcomes, Roeder asks how rules under authoritarianism can yield stable political coalitions. In turn, this leads him to reach the conclusion that the very stability of an authoritarian regime, based on a compact among oligarchs, may be untenable if the regime itself cannot cope with serious performance problems.

Roeder wants his model to turn our attention back to purely political processes and away from the more recent preoccupation with state-society relations. In this sense, he returns us to the classical concerns of Soviet political studies: how power and authority are built and maintained, how political coalitions are linked to policy lines, what different patterns of representation on leading party bodies tell us about the balance of power within the party state. On these matters, Roeder builds on, and formalizes, many of the findings of earlier Sovietological literature. But these gains come at a price. Left out of sight are social changes that altered the balance of power between regime and social groups, between center and regions, and certainly between the predominantly Russian political elite and the increasingly self-aware political and social elites in national republics and other ethnic-national territories. The problem of corruption, with its implications for the nationality dimension of politics, is not discussed. Perhaps even more central is the question of property rights. Could any communist party state have permanently reversed the decline of economic performance without establishing a secure property rights regime?

Roeder may, indeed, exaggerate the degree to which the regime operated under accepted rules of the game over the seven decades of its existence. Different leadership phases developed distinctive sets of understandings about legitimate means of seeking power, making policy, removing opponents, rewarding allies. These rules and informal constraints differed less as between the Khrushchev and Brezhnev periods than as between those two periods together and Stalin's reign. The "constitution" of the Stalin period, in turn, only gradually emerged out of the struggles of the NEP and war communism periods. Some scholars have gone so far as to say that there was, in fact, no single "Soviet system" because of the deep discontinuities between the operational codes of various leadership periods. This is surely overstated. But it is likewise misleading to speak of a fundamental "constitution of Bolshevism" unless it is also understood to mean the original Bolshevik project of building socialism in Russia.

THOMAS F. REMINGTON

The Birth of Judicial Politics in France: The Constitutional Council in Comparative Perspective. By Alec Stone. New York: Oxford University Press, 1992. 312p. \$45.00.

Judicial Politics in France is the first full-length study in English of France's Constitutional Council. An exhaustive account of a neglected institution, it adds an important chapter to our understanding of French politics. In a careful study of its activities from 1958 to the present,

and relying almost entirely on official French sources, Alec Stone traces the Council's gradual transformation from a relatively inactive quasi-judicial agency into a major policy-making institution of the Fifth Republic. Designed originally to assist the president in checking parliament, the Council has evolved into a weapon that legislative minorities have used to check the president and parliament as a whole.

The critical year in this transformation was 1974, when any 60 legislators in the Senate or National Assembly won the right to petition the Council for a ruling on the constitutionality of bills passed by parliament but not yet promulgated as law. With this expanded right of petition (it had previously been limited to the president, prime minister, and presidents of the two parliamentary chambers) and the Council's increasing readiness to annul or alter bills referred to it, parliamentary parties opposed to the government have been able to wrest changes in nonpromulgated legislation from both government and parliament. Stone documents this process in detailed case histories of legislation dealing with the nationalization of industry (chapter 6) and media broadcast policy (chapter 7). From these studies and related data, he concludes that the council's activities have significantly altered French executive-legislative relations, as well as subverted France's historic commitment to the principle of parliamentary supremacy

In Stone's account, parliamentary minorities refer an exceptionally large number of adopted bills-one out of seven in the 1980s-to the Council for scrutiny on constitutional grounds. These minorities have virtually converted the Council into a third legislative chamber. In nullifying or laying down conditions for the final passage of valid legislation and thus delaying its promulgation as law, they often force legislators to renegotiate the terms of earlier agreements. Even threats to take bills to the council prompt parliamentary majorities to accept legislative changes they would otherwise reject. Stone invents fancy terms such as autolimitation and corrective revision to describe parliament's reaction to the council's review of legislation, a response that transposes debates on policy into constitutional arguments and legalistic quibbling. The consequence of this process is the "judicialization" of the legislative politics and the 'politicalization" of constitutional review.

As its subtitle suggests, Judicial Politics in France introduces a transnational perspective. In part 3, "Toward a Comparative Understanding of Judicial Review," Stone compares the Council with the German, Austrian, and Spanish constitutional courts. Part 3, however, is little more than an addendum to an otherwise exemplary study of a single institution in one country. Its burden is to show that constitutional courts empowered to nullify legislation on abstract judicial review (i.e., review of legislation outside the framework of ordinary litigation) are engaged in an activity more legislative than judicial. Other constitutional courts, he finds, are engaged in a genre of political decision making no different from the activities of the council. In the end, Stone views judicial review as an undertaking rooted entirely in politics, and that view, he thinks, should drive the comparative study of judicial review.

Although provocative and interesting, part 3 will be seen as less than convincing by some constitutional scholars. Stone recognizes that constitutional review in France differs from its practice in other countries—i.e., that constitutional review of unpromulgated legislation

is different from the judicial review of laws already in force—but he nonetheless presses the work of the latter into the mould of the former. A glance at the notes may explain the reductionism. When Stone writes about the Council, he exhibits a surefootedness grounded in primary sources; but when he shifts attention to other countries, he betrays a reliance on secondary materials of limited value. What else would explain his acceptance of the view that German constitutional decision making is driven as much by partisan politics as the work of the Constitutional Council? What else would lead him to the conclusion that abstract judicial review is all politics and no law?

In fairness, however, Stone's comparative report should be seen as less a definitive account of the politics of judicial review than an ambitious effort to define a framework for the transnational study of judicial review. Stone is engaged in a worthy attempt to join constitutional law to the study of comparative politics. Constitutional scholars should applaud this effort and the strategy generally of deploying public law for the purpose of providing a more complete and nuanced account of policy-making in constitutional democracies. By the same token, as he continues his work on constitutional courts outside of France, Stone may begin to qualify his account of these tribunals and perhaps even concede that constitutional interpretation, at least in some legal settings, has its own integrity above and beyond politics.

As a comparative politics scholar, Stone is a rara avis. He is one of the first in the subdiscipline of comparative politics to take courts seriously, and he appropriately credits Martin Shapiro's work on "political jurisprudence" for inspiring him to turn his attention to judicial institutions. This is a happy development. Up to now, the comparative study of law and courts has been the preserve of public law scholars within political science, just as they and other legal scholars have dominated the study of foreign constitutional courts. The heavy doctrinal and normative emphasis of these legal scholars may be one reason comparative politics has failed to give their work the attention it deserves.

Stone, by contrast, views constitutional courts and their decisions as normal parts of the political process that any inclusive account of politics must consider. He shows that these courts are important in defining the rules of politics and that an account of their work and influence are essential to a fuller understanding of the political systems in which they operate. On the other hand, these courts also define the goals and aspirations of the constitutional polities in which they operate, a function that requires some distance from ordinary politics and some measure of devotion to law's integrity and the principle of judicial independence. In this respect, finally, Stone's account of the Constitutional Council's political jurisprudence might be contrasted to John Bell's recent study of its normative jurisprudence (French Constitutional Law, 1992).

Judicial Politics in France prompts a concluding comment on style. Stone has a tendency to italicize every important point in the book. Almost every page features italicized words or remarks, a practice that draws attention to itself and annoys the reader. Ordinary English words should not be italicized. The author, if he has any mercy at all, would allow his readers to do the underscoring.

University of Notre Dame

DONALD P. KOMMERS

INTERNATIONAL RELATIONS

Japan in the Posthegemonic World. Edited by Tsuneo Akaha and Frank Langdon. Boulder: Lynn Rienner, 1993. 295p. \$40.00 cloth, \$17.95 paper.

The Challenge of Japan: Before World War II and After. By Nazli Choucri, Robert C. North and Susumu Yamakage, New York: Routledge, 1992. 383p. \$59.95.

The two books under review are most welcome additions to the increasing literature in English on Japan's foreign policy, of which Gerard Curtis's collection, *Japan's Foreign Policy after the Cold War* (1992) is a notable example. They give readers fresh readings of Japan's foreign policy at a time when the world is changing very steadily.

Despite their differences, they share a common preoccupation with hegemony and a common underlying question: Once the U.S. hegemonic era is gone, is Japan

likely to be the next hegemon?

Their approaches are quite different. The Challenge of Japan focuses on the pre-World War II period and tries to see the post-World War II period with the same internally coherent conceptual framework. Japan in the Posthegemonic World focuses on the contrast between the pre-Cold War and post-Cold War periods, with the contributors focusing more or less on bilateral relations of Japan in specific policy areas. The Challenge of Japan argues that what the authors call lateral pressure (i.e., the demand for outward expansion derived from the configuration of population, resources, and technology) determines Japan's foreign policy, using simultaneous equation models based on macroeconomic time series data. In other words Japan's large expanding population, relatively poor resource endowments combined with a rise of demand for resources due to steady industrialization, and the advances in technological level are major determinants of lateral pressure for Japan. Whether it takes military or economic outward movement is determined by international environments. For the pre-1941 period, lateral pressure mounted, and Japan manifested its lateral pressure through military aggression. For the post-1945 period, the framework does not work very well. The authors admit this by saying, "In the long run, continued success in exporting manufactured goods was important in diverting Japan's lateral pressure away from the military form or mode (p. 294). Japan in the Posthegemonic World argues that "there is no hegemon to rescue us, no deus ex machina" and that "it is no longer a matter of either U.S. or Japanese hegemony; it is cohegemony (bigemony) or, a little more generally, a Pax consortis'." (pp. 88, 262).

The credibility of the approach and framework of *The*

The credibility of the approach and framework of *The Challenge of Japan* would have been further enhanced if the authors had confined the data to the pre-1945 period, while evoking the same conceptual framework both for the pre-1945 period and as they look to Japan's ascendance and its possible explosion in the future. In contrast to this, *Japan in the Posthegemonic World* does not well integrate later, empirical chapters with the first two or three chapters concerning the theory of global hegemony and the nature of Japan's power (the relatively sanguine pursuit of national interests combined with "a more constructive notion of leadership in a world of

complex interdependence" [p. 66]). Further efforts could remedy these shortcomings. For The Challenge of Japan one could develop the conceptual framework of lateral pressure on the basis of global market access in trade and investment, with population, resources, and technology components kept underneath in an era of protectionism and regionalism on the one hand and global environmentalism on the other. The conceptual framework could be devised more directly to the changed international environments. For Japan in the Posthegemonic World, we might justifiably hope for a singleauthored volume on the same theme. Although much has been written on Japan's foreign policy, still more remains to be done. Despite the increasing demand for books on the subject, the relative scarcity of specialists in Japan's foreign policy, especially in North America, leaves big lacunae unfilled for some time to come.

University of Tokyo

Takashi Inoguchi

The Presidency and the Rhetoric of Foreign Crisis. By Denise M. Bostdorff. Columbia: University of South Carolina Press, 1993. 316p. \$34.95.

As George Bush's meteoric public approval ratings in the wake of the Persian Gulf war aptly demonstrate, leadership in foreign crises from the Oval Office can provide clear domestic political benefits. But such approval can also be a short-lived aberration that flashes across the electoral scene like a Scud on a starless night. Denise Bostdorff correctly notes that presidents, although they do not create the world they face, play a large role in shaping public perceptions of that world by promoting, defining, and (sometimes) resolving foreign crises. Presidents influence world events and public perceptions not only with military and diplomatic initiatives but also with sometimes carefully chosen words and symbols. Their words and symbols then influence the policies they choose.

Bostdorff devotes her attention to the public rhetoric of presidents in foreign policy crises, arguing that we can gain insight into both the presidency and the men who have occupied it through close textual analysis of their speeches. The research design is both simple and ambitious: she picks one foreign crisis for each president from Kennedy to Reagan and looks closely at all relevant public statements by the president. She also looks at internal memos promoting particular policies and rhetorical statements and official statements by sanctioned spokespeople. In this regard, Bostdorff's work is a real advance over previous studies of presidential rhetoric focusing on "major" speeches, such as State of the Union addresses or other formal addresses. She recognizes that a few unguarded comments can do as much to influence public perceptions as the most carefully crafted formal address.

To her credit, Bostdorff does not present rhetoric as an independent creation, but attempts to situate each discussion in both the foreign and domestic politics of the time. She begins each chapter by setting the international scene and the domestic pressures that the presi-

dent faced. It is impossible not to admire the sheer volume of materials (archival documents, public papers, and a range of historical and analytical treatments) that she synthesized in order to assess the real importance of presidential rhetoric. At the same time, the foreign policy specialist or historian may find some of the necessarily brief treatments of context frustrating. For example, Bostdorff notes, in her chapter on Jimmy Carter and the Iranian hostage crisis, the speculation that candidate Ronald Reagan cut a deal with the Iranian government to ensure that Carter's efforts would not succeed while he was in office. Bostdorff provides no critical perspectives or evaluations of these charges.

The heart of Bostdorff's analysis is a formal dissection of presidential rhetoric, using a method developed by Kenneth Burke, a theorist of rhetoric. Putting language at the center of concern and finding motivation within the texts, Bostdorff attempts to discover how each president portrayed the "crisis" situation, the style the president employed in managing the crisis, and the bases of identification of allies and enemies he encouraged in the public. Through this method, she intends to illuminate differences in style and substance among the presidents and derive some insights about the nature of crisis promotion in contemporary presidential politics. (Bostdorff's use of Burke's method will be new to many political scientists, who may find it difficult to wade through the textual analyses.)

The differences, as expressed in close readings of each case, are subtly drawn and produce sometimes surprising insights. Bostdorff finds that President Ford, for example, departed from the standard practice of crisis promotion when the Mayaguez was seized off the coast of Cambodia. Whereas other presidents inflated such events, promoting crises to promote their own leadership, Ford himself was silent on the matter. His public affairs staff provided only brief descriptions of events as they developed. When the crisis ended, Ford described the events and his actions only briefly. Bostdorff suggests that Ford's silence was a deliberate rhetorical strategy to bolster his standing as a national leader. Unelected, Ford desperately sought to cultivate legitimacy as president by allowing his staff to portray him as competent, active, and busy responding to the problems of the day. Aware of his own difficulties with public speaking, Ford limited his public speeches and even his answers to questions at press conferences. In this way, he was able to maximize the political benefits attendant to the crisis-by saying less.

In stark contrast, Jimmy Carter initially spoke frequently about his handling of the Iranian hostage crisis, emphasizing publicly the principles by which the United States would manage the affair. At the same time, by constantly reiterating principles but rarely reporting progress, he undermined public perception of his efficacy as a leader. "The idealism of Carter's rhetoric," Bostdorff writes, "also constrained his crisis management by narrowing the range of policy options he could pursue to those that he deemed consistent with the

moral principles he set forth" (p. 159).

Of course, the analysis of Carter points to a critical question Bostdorff dodges: To what extent is rhetoric a reflection or a cause of presidential policy in a foreign crisis? Bostdorff considers explicit political planning in conjunction with the psychic vulnerabilities of American presidents, without placing anything above the texts of presidential speeches, both improvised and committeecrafted. The real role of rhetoric as reflection and as source of, or substitution for, policy remains to be explored.

John Kennedy, she argues, established formal mechanisms and legal justifications for crisis promotion and management, an infrastructure that remains. While there are recurrent patterns in presidential rhetoric, the infrastructure has grown and strengthened. Bostdorff concludes: "The relationship between power and discourse appears to be symbiotic. The president's control over foreign affairs allows him to indulge in crisis promotion; at the same time, crisis promotion frequently helps the commander-in-chief to expand and consolidate his power. This is a dangerous combination indeed" (p.234). Scholars of the presidency-and of foreign policy more generally—owe Denise Bostdorff a debt for framing this problem of modern democracy so sharply.

DAVID S. MEYER

The State of the European Community, Volume 2: The Maastricht Debates and Beyond. Edited by Alan W. Cafruny and Glenda G. Rosenthal. Boulder: Lynne Rienner, 1993. 435p. \$49.95.

The 1992 Project and the Future of Integration in Europe. Edited by Dale L. Smith and James Lee Ray. Armonk: Sharpe, 1993. 260p. \$45.00 cloth, \$17.50 paper.

Part of the professional creed of political scientists is the belief that narrowly focused academic volumespreferably monographs—are the most worthy. Yet this has not consistently been true of the scholarly study of the European Community. To be sure, the field was launched in the 1950s and 1960s by a series of monographs by Ernst Haas, Leon Lindberg, Joseph Nye, and others. The next two decades, however, saw a series of substantively broad-ranging yet theoretically sophisticated volumes assessing the state of the European Community, including those edited by Leon Lindberg and Stuart Scheingold, Helen and William Wallace and Carole Webb, Alberta Sbragia, and (most recently) Robert Keohane and Stanley Hoffmann.

Like its distinguished predecessors, each of the books reviewed here has two stated purposes: to document the current condition of European integration and to theorize about it. The 1992 Project, edited by Dale Smith and James Lee Ray, contains 12 essays, four on integration theory and eight on specific topics ranging from defense cooperation to the role of subnational development agencies. Without striving for comprehensive coverage, the authors uncover a wealth of interesting information. Several essays cut sharply against the grain of conventional wisdom. John Conybeare rigorously grounds his skepticism about the future of transatlantic trade relations in optimal-tariff theory. Paulette Kurzer offers a provocative analysis of the European Monetary System as instrument and indication of the "passing away . . . of social democracy and the postwar settlement" in small corporatist democracies (p. 140). David Garnham traces in intriguing detail the Anglo-French flirtation in 1990 with an anti-German alliance. Russell Dalton and Richard Eichenberg seek to revitalize the study of public opinion and integration.

As its title suggests, *The Maastricht Debates and Beyond*, edited by Alan Cafruny and Glenda Rosenthal, does aim at comprehensiveness—and splendidly achieves it. Second volume in a biennial series sponsored by the European Community Studies Association, it contains a rich and timely collection of 23 essays on European Community developments over the past two years. The reader senses the unusually astute eyes and firm hands of two editors committed to maintaining a strong standard of selection and execution. The essays are uniformly concise and focused, yet lively.

Cafruny and Rosenthal seek to provide a detailed overview of issues ranging from immigration to telecommunications and (though with less enthusiasm than Smith and Ray) to provide social scientific explanation of those events. In the service of the first goal, special mention must be made of the useful, detailed review of the Uruguay Round negotiations by Finn Laursen; Sir William Nicoll's analysis of the Maastricht negotiations, which reflects an intriguing mixture of federalism and skepticism; and the especially thorough treatment accorded Germany and the EMU negotiations. On the latter topic, David Andrews and Wayne Sandholtz document (as widely reported at the time) the initial success of Helmut Kohl's personal efforts to strengthen, at least on the margin, the German commitment to monetary integration. Particularly insightful is Paul Welfens's analysis of the macroeconomic contradictions of Bundesbank policy.

Here, too, are contributions that employ social-scientific analysis to generate unexpected insights. Dale Smith and Jürgen Wanke make elegant use of descriptive statistics to determine who wins and who loses by "Europe 1992." Walter Goldstein provides a toughminded review of the European Community's internal tension between market liberalism and industrial policy. Robert Geyer carefully compares British and Norwegian socialism in the new Europe.

Yet, while both books mention fundamental theoretical questions of European Community studies, they ultimately decline to provide distinctive answers to them. The current conjuncture of the Community has raised many such questions, many closely linked with enduring concerns of comparative and international politics: How does the relative power of the Commission and member governments vary across issues? Does Community integration strengthen or weaken the state internally? Under what conditions and in what ways does membership in the Community alter the relative influence of domestic political groups? Has national support for European integration undergone a fundamental process of politicization, transforming a "passive" into an "active" consensus? Under what conditions do European countries share an underlying interest in moving from "negative" to "positive" integration, that is, from market liberalization to the joint provision of public goods like macroeconomic stability, environmental protection, and a common defense? Is the Community evolving into a new sort of polity, or do present trends presage an extension of long-term patterns?

If a theoretical theme can be discerned in these two volumes, it concerns the last question. Both books stress the increasing complexity and diversity of the European Community. For Smith and Ray, complexity emerges, above all, from the Community's institutional structure. The European Community is one of the few interna-

tional organizations with a supranational officialdom possessing significant, though limited, autonomy. With the inclusion of another actor and forum, what Robert Putnam has termed a "two-level game," played by statesmen on domestic and international "boards," becomes a "three-level game." (Indeed, Smith and Ray hint that Community external relations and transnational coalitions add a fourth and fifth level!) At the same time, the Commission seeks to empower subnational actors, thereby further diffusing political power. In his analysis of regional policy in The Maastricht Debates, Gary Marks asserts that "we are seeing the emergence of a multilevel governance, a system of continuous negotiation among nested governments at several territorial tiers—supranational, national, regional, and local" (p. 392). A causal link between greater complexity in policymaking and greater diffusion of political power is surely an important proposition about the development of the European Community (although, it must be added, a more highly debatable one than either volume hints). My own view is that on balance, far from undermining the state domestically, the Community actually strengthens it.

Even if we provisionally accept the hypothesis that complexity is diffusing power in some issue areas, simply to celebrate complexity is to make a virtue of necessity. The next step, an essential one for social scientists, moves from observation to explanation. What is the theoretical significance of complexity and diffusion of power? Under what conditions does the relation hold? What are the implications for integration? Here both volumes leave the field to others. Despite their admirable ambition in this regard, Smith and Ray do not move beyond the metaphor of "three-level games" to theory—retreating, instead, in their concluding chapter, to the reassertion that political union is a sort of European destiny. Perhaps constrained by the format of their book, Cafruny and Rosenthal, too, make little attempt to postulate an overarching model or a common set of hypotheses, contenting themselves, instead, with the modest conclusion that intergovernmental negotiations between member states appears to remain central. Marks asserts only that the starting point must be the assumption that the Community is a "complex, opentextured and fluid" polity. But if this is the theoretical starting point, where is the endpoint?

The problem is not a new one. It closely resembles the predicament facing theorists of "complex interdependence" in the 1970s, who found that the assumption that everything is connected to everything else is, ultimately, no assumption at all. Only the more detailed analyses of trade and capital interdependence since the mid-1980s, firmly grounded in explicit microfoundations, have provided strong testable propositions. The study of interdependence has grown richer as a result. Similarly in European Community studies, analyses such as those found in these two books perform an indispensable function by opening our minds to a wide range of possibilities; but it now falls to theoretically structured empirical analyses to help separate the wheat from the chaff. It is here-more than in reviews of recent eventsthat social scientists can claim a distinctive comparative advantage over the myriad annual reviews of the European Community that have sprung up in recent years.

There are two complementary paths forward. The first, as Leon Lindberg notes in the Smith and Ray volume, is to develop more explicit, generalizable theories of economic interest, interstate bargaining, and

international regimes. Modern theories based on specified causal mechanisms at the micro level offer many of the tools to move beyond ideal-typical description to explanation. Recent works by Giandomenico Majone and George Tsebelis, for example, suggest subtle, counterintuitive consequences of complexity in the Community. The second path is to pursue serious cross-issue, cross-national, and cross-temporal comparative analysis. The sudden success of the 1992 initiative has encouraged, among scholars, a historical myopia in European Community studies that is more pervasive, yet considerably less justified, than that of the 1960s. Moreover, there is a dangerous tendency to generalize from specific issues or single decisions. Only explicitly comparative analysis-within the Community and between the Community and other organizations) can tell us whether the current conjuncture is the continuation of old politics under new circumstances or the emergence of a new institutional patterns of politics altogether.

This sort of sustained social-scientific inquiry is quite consistent with the careful analysis of recent events found in these two books. One hopes that forthcoming volumes of this type will serve as vehicles to unite the two.

Andrew Moravcsik

The New Global Economy in the Information Age: Reflections on Our Changing World. By Martin Carnoy, Manuel Castells, Stephen S. Cohen, and Fernando Henrique Cardoso. University Park: Pennsylvania State University Press, 1993. \$25.00 cloth, \$12.95 paper.

For the reader looking for new arguments or evidence about change in the world economy, this book will be a disappointment. On the other hand, it offers a succinct, albeit one-sided, summary of familiar arguments and data about the world economy in four areas (each treated by a different author): the new world informational economy, the continuing power of multinational enterprises, the decline of American hegemony, and the marginalization of the poor developing countries.

The underlying theme is that national policies still matter in the new world economy. Manuel Castells, in the opening essay, argues that the "'developmental state', a code word for Japan, played a fundamental role in affecting the transformation of the world economic structure in recent years" (p. 23). Martin Carnoy writes that although "multinational enterprises are powerful economic actors, . . . nation-states can also be key actors in shaping what multinationals do," especially in promoting local human-capital development and researchand-development financing (p. 93). Stephen C. Cohen is even more emphatic that national policies dictate success. He points primarily to a "set of institutional innovations" pioneered by Japan that employ the state as gatekeeper, the keiretsu industrial organization, and the targeting of key technologies and industries (p. 100). Finally, Fernando Henrique Cardoso concludes that developing nations, too, can succeed if they pursue the right policies: "Either the South (or a portion of it) enters democratic-technological-scientific race, invests heavily in R&D, and 'endures the information economy' metamorphosis, or it becomes unimportant, unexploited and unexploitable" (p. 156).

The theme of the book is directed against those who

claim that freedom (individualism) and global markets have triumphed and that national policy choices must be subordinated to economics. This theme is welcomed as a corrective to an earlier overemphasis on interdependence and dependence, to which some of these same writers contributed, particularly Cardoso. But the authors are a bit one-sided in what they consider the right national policy choices to be.

They see Japan as the preeminent leader of the new informational economy. In fact, Japan lags in the information age. According to Bill Baumol and his associates (Productivity and American Leadership), both Japan and Europe have a smaller share of their labor force in the new information and service sectors than does the United States (57% and 59%, respectively, compared to 71% in the United States). In addition, the United States is more competitive in the information economy. Recent studies by McKinsey, the international management consulting firm, show that American manufacturing and service industries have restructured well ahead of Japan and Europe and today enjoy a substantial lead in the information sectors that is, telecommunications, software, computer networking, multimedia technologies, and financial services. Ignoring these data, the authors also give no hint of the fundamental structural problems faced in Japan (and Europe). Recently, Japanese investment and growth have slowed precipitously. In 1992, Japanese manufacturing productivity dropped 6.2% while that of the United States rose 4.2%.

The volume also overstates America's decline. It repeats the litany of criticism of U.S. policies in the 1980s but says nothing about the downsizing and productivity improvements in American industry in that decade or the powerful surge of American exports from 1986 to 1992. American manufacturing productivity grew at a rate of 3.5% per year in the 1980s, against a rate of 2.5% per year in the 1950s and 1960s, and American exports doubled over the five years prior to 1993, regaining market share around the world. There is much to criticize in American policies in the 1980s, but it is an overreaction to label these policies "a romantic reaction, a return to the simplicities and uncertainties of America's uplifting past" (p. 123).

The failure to the drawbacks of Japanese—or the benefits of American—policy choices leads to curious recommendations for European policy. Europe is counseled neither to deregulate aggressively as in "Europe 1992" or to exploit trade and investment opportunities with the low-wage countries of Eastern Europe and the former Soviet republics as the United States deregulated and shifted production to the Asian advancing nations. Instead, Europe is urged to maintain its welfare system, develop national champions (even though elsewhere the authors acknowledge this strategy has failed), and pursue a European-level response involving "substantial amounts of government action in order to protect and transform the structure of European industries in profound ways" (pp. 95, 143). No mention is made of Europe's near-catastrophic unemployment problem (12%), budget deficits in Europe that on average are larger than the U.S. deficit (5.1% compared to 4.5% in 1992), or wage and benefit costs in Europe that far exceed those in Japan and the United States and cripple European competitiveness, precisely in those sectors where former communist countries could supply European markets much more efficiently and equitably.

The essay on developing nations is more reflective.

Cardoso, who did much to popularize the role of the state and dependency in North-South relations, now concedes that "politics is not the center of all change" and that "the theory of exploitation (of classes and of nations) has been shaken by an earthquake of magnitude 8 on the Richter scale" (pp. 151-52). Contrary to dependency logic, much of the South did develop; and it did so, according to Cardoso, not because of "more" or "less" state intervention but because of "better" state policies reflecting the "new rationality" of "decentralized forms of management and decisionmaking" (p. 155). Unless poor developing nations adopt the same policies, Cardoso fears they face an even crueler fate of marginalization and irrelevance. Unwilling to jettison his socialist preferences yet ambivalent about centralized policies, Cardoso calls for a democracy of "collective humanism" that creates "public spaces" and "a plurality of decisionmaking levels, making feasible a 'polyarchical utopia'," whatever that may be (p. 155).

Most of the essays were completed before 1992. An epilogue is therefore added that points to Clinton's election, the rise of nationalism in the former communist world, and the grass roots, populist revolt against the Maastricht Treaty as proof of the book's thesis that national policies are essential to rein in the individualist and laissez-faire tendencies of global economic liberalism. "The source of Clinton's landslide election," the authors conclude, "was his program to revive the American economy, with emphasis on American" (p. 162). While landslide is apparently meant to include the Ross Perot vote, the attempt to validate scholarly analysis with electoral results only confirms the one-sidedness of this study.

HENRY R. NAU

International Peacekeeping. By Paul F. Diehl. Baltimore: Johns Hopkins University Press, 1993. 211p. \$36.50.

Alas for authors in the field of international relations in the mid-1990s and, above all, for those who write about something as contemporary as United Nations peacekeeping! International Peacekeeping evidently went to press just before the "three cases from hell"—Bosnia, Somalia and Haiti—hit the political fan. This is a shame, because it might have enlivened a rather pedestrian, albeit comprehensive, survey of the universe of multi-lateral peacekeeping. The experiences of UNEF I and II, UNFICYP in Cyprus, UNOFIL in southern Lebanon, and others are all well known and not particularly controversial, to the point where a new truce-supervising peacekeeping venture is a dog-bites-man event.

But since 1991, the United Nations has ventured further into an unchartered and distinctly controversial realm, variously called "peacemaking," "humanitarian intervention," and (in Secretary General Boutros Boutros-Ghali's word) "peace enforcement." It began promisingly in northern Iraq after the Gulf War ended, with a still-resilient Saddam Hussein now battering his Kurdish population in the north and Shi'ites in the south. Public indignation drove the United States and United Nations (an inseparable pair for this purpose) to help those hapless souls despite the opposition of the Iraqi government—a first for peacekeepers. The breakup of Yugoslavia raised similar humanitarian concerns, as did anarchy and famine in Somalia and trash-

ing of democratic government in Haiti. But Bosnia revealed the depth of Europe's moral insufficiency, Somalia and Haiti the superficiality of American's new commitment to multilateralism. It was not just manbites-dog but watch-everyone's-hair-catch-fire in New York and Washington. The upshot was a jamming on of the multilateral brakes and an agonizing reappraisal of U.S. policy.

The present author missed all of this through no fault of his own. But his rather plodding approach to traditional peacekeeping (one of history's genuine political—military innovations) suggests that even an updated version of the book might not stimulate the student or scholar to pursue it further. That is the bad news. The good news is that for an inventory of names and numbers of the players, along with some references to relevant political doctrines that are buried in the text, this book is probably the most recent on the topic.

LINCOLN P. BLOOMFIELD

Bridging the Gap: Theory and Practice in Foreign Policy. By Alexander L. George. Washington: United States Institute of Peace Press, 1993. 170p. \$24.95 cloth, \$14.95 paper.

Alexander George undertakes an ambitious task in Bridging the Gap and does a more-than-creditable job in accomplishing it. George sets out to "encourage better communication and closer collaboration between academic scholars who study foreign policy and practitioners who conduct it." After describing the disparate cultures of academia and policy-making, George gets to the heart of his argument by identifying three types of knowledge that can help policymakers decide whether and how to employ a particular strategy: abstract, conceptual models of each strategy; generic knowledge of the conditions that impinge upon the likelihood of success of a strategy; and actor-specific, behavioral models of the adversary. George carefully analyzes U.S. policy toward Iraq from 1988 through 1991 and concludes that there was an inadequate knowledge base for that policy. In the book's concluding chapter, he offers six implications for scholarly research and policymaking.

Bridging the Gap does an excellent job of diagnosis. The author's substantial experience in both the academic and government policy-making worlds combines with his insight to allow him to present a cogent analysis of the differences between the cultures of academia and government policy-making. Both academics and policymakers should find themselves nodding in agreement with George's observations about the two cultures. The "gap" may or may not be bridgeable but the necessary first step in attempting such a task is the type of carefully thought-out diagnosis of the problem that George provides.

The three types of knowledge that George puts forth, as essential for helping policymakers decide whether and how to employ a particular strategy are all quite important. I find the call for such models to be highly insightful, but I do urge an embellishment of that call. In order to understand and assess virtually any set of

circumstances in foreign policy (including the recent U.S. policy toward Iraq that George uses as his primary example), one must analyze more than dyadic interactions. It is important both that such actor-specific behavioral models include the adversary's view of other actors and that they be developed for more actors than just the acknowledged adversary. These embellishments would substantially enhance the policy utility of such models

George understands that theory can be a pejorative term in the policy-making community. For that reason, he employs the term generic knowledge when arguing for the relevance of theory. My first reaction is sadness at George's undoubtedly correct analysis of the potential response of many to the term theory. However, I am buoyed by the emphasis, within that discussion, on what one might term scope conditions for generalizability. Such scope conditions are clearly a critical part of any bridge between theory and practice. The plea for such scope conditions is one that, if heeded, would also enhance communications between a variety of academic communities. Also, George is to be commended both for addressing some of the shortcomings of applying a strictly neorealist paradigm to foreign policy questions and for highlighting research that more carefully analyzes the theory of appeasement than any other post-World War II author of whom I am aware. George attempts to apply evidence from more cases than Nevelle Chamberlain's ill-fated policy toward Hitler in drawing his conclusions.

As George undoubtedly appreciates, he is the latest in a long line of scholars attempting to bridge the gap between theory and practice in foreign policy. In much of Bridging the Gap, I am reminded of Davis Bobrow's "Relevance Potential of Different Products" (World Politics [1969]). Among other similarities, both argue for the relevance of theory, the importance of bridging the gap, and then offer a "construction plan" for the bridge. However, where Bobrow concentrated more on the importance of focusing on policy-manipulable variables (also mentioned by George) and offered only a variety of brief examples, George's use of a set of examples all drawn from U.S. policy toward Iraq communicates well to readers in both academic and policymaking communities. Emphasizing the relevance of the proposals that George is making by applying them to such a recent foreign policy case will certainly broaden the audience that pays attention to his message.

Building upon the message of George's book would be an important next step. In his concluding chapter, he provides a number of possible avenues for accomplishing this. I will now add to that list. A more specific and comprehensive application of the types of knowledge for which he calls is crucial. Either recent U.S. policy toward Iraq or another case should be employed even more comprehensively to show exactly how the types of knowledge for which George calls could be employed to produce improved policy results over failure to employ such knowledge. George outlines what models employing the three types of knowledge should contain. Building such models based on "conditional generalizations" and interacting with policymakers about them might start the type of dialogue that George is seeking.

DONALD SYLVAN

Minorities at Risk: A Global View of Ethnopolitical Conflicts. By Ted Robert Gurr. Washington: U.S. Institute of Peace Press, 1993. 448p. \$37.50 cloth, \$24.95 paper.

Ted Robert Gurr is probably best known for his Why Men Rebel (1970) which remains the fullest application of relative deprivation theory to conflict analysis. In Minorities at Risk, Gurr surveys the world to present "an integrated substantive and empirical analysis of communal status and conflict since the end of World War II, with special attention to the decade of the 1980's" (p. xi). This time, Gurr steers a median course between relative deprivation and group mobilization explanations of conflict and also between primordialist and instrumentalist interpretations of ethnicity. In this reasonable trade-off, theoretical incisiveness is sacrificed to a looser analysis that better accommodates a multitude of cases.

The empirical core of the book is a comparative, cross-national analysis of 233 politically active communal groups (whose members number some 915 million persons) in 93 countries. These groups are coded into five categories: ethnonationalists, large groups with a history and dream of political autonomy (e.g. Croats, Québecois); indigenous peoples, conquered descendants of original inhabitants (Miskitos, Maoris); ethnoclasses, low-status minorities descended from slaves or immigrants (African-Americans, Koreans in Japan); militant sects, communities politically defined by religion (Northern Irish Catholics, Lebanese Maronites); and communal contenders, culturally distinct groups seeking to retain or augment their share of the national pie, who may be subcoded as advantaged or disadvantaged (Tutsi of Burundi, Chinese of Malaysia, respectively). The boundaries of both groups and categories are admittedly "fuzzy," and several groups (notably, all but 8 of the 43militant sects) are coded under more than one category.

Specialists will properly quibble about coding and terminology: Why should the Masai be more "indigenous" than the other peoples of Kenya and Tanzania? Is it not at least a misnomer to apply the label "militant" to the Baha'is of Iran? Still, the categories are firm enough to yield useful empirical statements when plotted against indices of cultural differences, discrimination, and types and frequency of political action. As Gurr shows, overall, every form of ethnopolitical conflict has increased since the 1950s, but trends differ widely among regions. For example, within Western democracies, conflict peaked sharply in the 1970s, then declined, while in Eastern Europe, it increased sharply in the 1980s. Cultural differences have no effect on inequalities for ethnoclasses or communal contenders, but they are associated with discrimination against ethnonationalists. In general, cultural differences have a greater effect on economic than on political disadvantage. Religious cleavages are seldom at the bottom of communal conflicts, though they may help exacerbate such conflicts. While Gurr's categories are not ideally set up for this purpose, little in his findings would provide empirical comfort for a Huntingtonian vision of a world about to be riven by a "clash of civilizations."

Four of the book's 11 chapters provide regional context and exemplification for the global generalizations. Monty G. Marshall deals with Eastern Europe and the former USSR, Barbara Harff with North Africa and the Middle East, and James R. Scarritt with sub-Saharan Africa, while Gurr himself takes on the Western democ-

racies and Japan. Useful as these chapters are, none has the space to provide the detail and the qualifications one would like. The sub-Saharan Africa chapter strikes the most graceful balance between reverence for the comparative framework and the specific demands of local experience, though too much weight is placed on the colonial experience in accounting for the ethnic diversity of African states. The East European chapter spends disproportionate space on discussing the differences between Lenin's and Stalin's views of the "national question." The North Africa and Middle East chapter's shaky discussion of Berber-Arab relations in Morocco should be bolstered by a more systematic comparison with such relations in Algeria. And who let slip by the howler assigning the Turkish language an "Indo-Germanic origin?" (p. 221).

Although Minorities at Risk does not provide a major conceptual or methodological breakthrough, it provides a wealth of useful empirical material and a model of large-scale cross-national comparative work on complex and important subject matter. The book should quickly find its way onto the required reading list for courses on nationalism and ethnic conflict, where it would provide stimulating intellectual counterpoint for more speculative exercises of historical interpretation like Anderson's Imagined Communities (1983) and Moynihan's Pandaemonium (1993). It also should provide those immersed in regional studies with a comparative context for their more parochial discussions of communal conflict. In an era when support for large-scale empirical work is hard to come by, the U.S. Institute of Peace is to be congratulated for having sponsored and sustained this ambitious project.

Yale University

WILLIAM J. FOLTZ

The Politics of Economic Adjustment. Edited by Stephan Haggard and Robert R. Kaufman. Princeton: Princeton University Press, 1992. 356p. \$49.50 cloth, \$16.95, paper.

Since the early 1980s, the challenge of adjustment has dominated economic policy throughout the developing world. In many countries, economic reform has been concurrent with democratization and regime change. Neoclassical reform measures, urged upon indebted countries by multilateral lenders and G-7 governments, pose significant challenges to the sovereignty, ideology and domestic prerogatives of state elites. Stabilization and adjustment programs demand substantial administrative capacity and political skill, while the powerful distributive conflicts unleashed by economic change threaten the legitimacy and stability of incumbent regimes. Advocates of neoclassical reform suggest its compatibility with democratization, yet the relationship between political and economic liberalization remains ambiguous.

The Politics of Economic Adjustment represents an impressive effort to summarize the political legacy of economic reform, and to clarify the elusive relationship between political transition and economic change. In its comparative breadth and theoretical depth, this volume has few peers in the contemporary literature in comparative political economy. The chapters offer important contributions to current debates on economic change and regime transition, and the book provides a wealth of

policy-relevant insights which might also be applied to the transition economies of Central and Eastern Europe.

The Politics of Economic Adjustment is the third volume in a series of studies on the politics of economic reform. The companion works, Fragile Coalitions: The Politics of Economic Adjustment (1989) and Economic Crisis and Policy Choice (1990), both edited by Joan Nelson, were respectively devoted to the policy dynamics of reform and a series of comparative case studies of economic adjustment in Latin America, Africa and Asia. The volume under review seeks to synthesize the conclusions of the earlier efforts, and to offer a number of middle-range propositions about the political context of adjustment. The book's seven extended chapters are organized around four broad themes: the relative salience of international influences and domestic actors in the process of economic adjustment; the role of the state in economic restructuring and the scheme of state reform; the distributive implications of stabilization and adjustment strategies; and the relationship of economic adjustment and democracy.

These are controversial issues, and the analyses in this volume offer critical revisions of many common premises regarding politics and economic reform. One such notion is that orthodox programs have been successfully imposed by a monolithic creditors' cartel, led by the IMF and the World Bank. In the opening section, Barbara Stallings and Miles Kahler provide discerning evaluations of the international context of economic adjustment. Stallings considers the distinct roles of international markets, policy networks and northern-dominated regimes in promoting reform among developing countries. While external structural constraints and transnational networks provided complementary channels influencing an initial shift toward orthodox adjustment, Stallings notes that international factors are less compelling in accounting for policy implementation and outcomes.

Échoing this caveat, Miles Kahler acknowledges the importance of international factors in agenda-setting, but observes that international financial institutions and northern commercial banks had relatively weak leverage over wide realms of debtor-country policy choice and implementation. In fact, the global regime governing debt and adjustment weakened throughout the 1980s, as the "conditionality bargain" offered by creditors failed to offer substantial incentives for imposing politically costly austerity measures. Eventually non-conditional resources were renewed, and the unity of creditor groups frayed as they pursued divergent strategies. Many developing countries were able to evade conditionality or to pursue heterodox strategies.

The limits of international-level explanations point to a greater stress on the domestic politics of reform, and succeeding chapters offer both state-level and society-centered analyses. A second perspective challenged in this volume is the neoclassical assumption that state intervention is inherently detrimental to economic growth. In the book's strongest theoretical chapter, Peter Evans reassesses debates about the developmental state. States confront basic collective action problems, observes Evans, and neither arguments about the rent-seeking "predatory" state, nor depictions of a coherent, autonomous "developmental" regime adequately capture the political qualities leading to economic success. Evans offers the compelling notion of "embedded autonomy" to portray the character of developmental

states. Such regimes embody internal coherence, discipline and autonomy from fragmentary societal interests, yet they also maintain diverse linkages with society through personal networks and corporatist arrangements, which serve to garner information and foster compliance.

John Waterbury's comparative analysis of public sector reform in Egypt, India, Mexico, and Turkey provides a laudable attempt to portray the scheme of state reform in more empirical fashion. Waterbury notes that heavily statist economies give rise to similar forms of property rights and interest group coalitions, implying comparablity in the dynamics of reform. He emphasizes the importance of technocratic "change teams" within the state, endowed with a mandate to implement a reformist project. Impelled by growing fiscal constraints, reformminded state elites may surmount the scattered opposition of a statist coalition, and privatize or restructure state enterprises.

A third controversy confronted here is the impact of stabilization and adjustment on the poor, and effects of distributive tensions on social conflict and political stability. Joan Nelson analyses discrepancies between the differential costs of adjustment and the relative political salience of affected groups. While urban, formal sector groups experience greater losses under adjustment, the urban and rural poor are more vulnerable, since they possess fewer strategies for coping with price changes and income reductions. However, privileged urban constituencies exercise preeminent political influence, and are likely to block redistributive policies which could reduce the vulnerability of the very poor. Nonetheless, organized labor and urban dwellers are more likely to engage in sporadic, disparate protests against particular effects of reform rather than concerted protest against adjustment per se. Government strategies for dealing with affected groups, and general popular perceptions about economic management, may significantly assuage protest and opposition.

Ŷ

٠₹

In a comparative study of the politics of inflation and stabilization, Stephan Haggard and Robert Kaufman also stress regime factors rather than the strength of distributive coalitions. They find that inflationary tendencies are attributable to the relative security of elite tenure and the capacity of political institutions to resist distributive pressures. While recognizing the contribution of external shocks and devaluations to inflation, they emphasize that rates of inflation and proclivities toward stabilization are more closely related to regime type. They also observe that authoritarian governments evince few generic advantages over democracies in pursuing stabilization, although relatively cohesive authoritarian governments reflect a stronger record of limiting high inflations.

The focus on distributive pressures and regime response raises the central issue of political transition. Is democracy compatible with economic adjustment? Or, do the political costs of adjustment weaken transitional governments and foster authoritarian management? Haggard and Kaufman conclude with a chapter assessing the impact of economic crisis on regime transition. They refute the impression that economic decline in the 1980s prompted extensive regime change, and they observe that weak economic performance has not produced a widespread breakdown in transitional democracies since the early 1980s. They relate the stability of regimes, both authoritarian and democratic, to relative levels of elite cohesion and political institutionalization. The sequencing of political and economic change, and the configuration of executives and party structures, are crucial determinants of democratic transition and con-

There are few qualms one might raise about this collection. While the volume generally avoids the eclecticism of many edited works, the authors naturally hold divergent views over central questions. Certain authors seem too ready to accept the orthodox agenda as a framework for evaluating policy choice and performance, even developments prior to the 1980s. Moreover, the comparative analyses sometimes tend toward a welter of idiosyncratic qualifications, thus blurring the strengths of the comparative framework and obscuring important conclusions. These are largely stylistic weaknesses, however, and they should not detract from the commendable strengths of this book. The Politics of Economic Adjustment represents the most comprehensive comparative work in this area, and it is a collection of impressive analytical rigor and theoretical depth. It will provide a lasting touchstone for the study of economic and political reform.

Peter M. Lewis

The United States and Latin America in the 1990s: Beyond the Cold War. Edited by Jonathan Hartlyn, Lars Schoultz, and Augusto Varas. Chapel Hill: University of North Carolina Press, 1992. 328p. \$39.95 cloth, \$15.95 paper.

The end of the Cold War marked a turning-point in inter-American relations. From the early nineteenth century through the late 1980s, the U.S. policy toward Latin America primarily focused on real, potential, or imagined threats to its national security from extrahemispheric powers operating in or through Latin American states. In particular, for much of the period from the late 1940s through the 1980s, U.S. decisionmakers molded military, economic, human rights, immigration, and other policies to counter the strategic and ideological challenge posed by the Soviet Union. Superpower rivalry strongly influenced both the foreign policies and the domestic politics of many Latin American countries. Thus, the end of the Cold War, in combination with important political changes in the United States and in major Latin American countries creates new opportunities for U.S.-Latin American cooperation.

This outstanding collection of essays examines key trends in U.S.-Latin American relations and the consequences of recent international and domestic political developments for hemispheric affairs. The editors and the 12 Latin American and U.S. contributors are among the foremost authorities in their fields. Together, their essays provide a comprehensive examination of both unresolved tensions in inter-American relations and the specific problems facing U.S. and Latin American poli-

cymakers in the 1990s.

The book begins with the editors' introductory essay and three overview chapters by Alberto van Klaveren, Augusto Varas, and Abraham F. Lowenthal. The authors of these essays concur that the end of U.S.-Soviet strategic rivalry in the Western Hemisphere, global economic restructuring, the democratization of foreign policymaking in the United States, and a widening consensus in major Latin American countries in support of political democracy and market-led economic development have significantly transformed U.S.—Latin American relations. Among other things, these changes have further eroded old foreign policy assumptions and produced greater heterogeneity in the bilateral foreign policies of hemispheric states.

Van Klaveren, for example, discusses Latin American countries' efforts since the 1970s to strengthen diplomatic and economic ties with West European countries and Japan, as well as the prospects for collective Latin American action on economic and security problems. Varas's chapter examines shifts over time between "hegemonic" and "coercive" paradigms of hemispheric order, noting that the coincidence of particularly favorable international and domestic conditions may lay the basis for "cooperation through partnership" in the 1990s. Varas argues that the "coercive continuities" in U.S. policy (most recently manifested in the invasion of Panama in December 1989 and the assumption that we retain the right to intervene in the affairs of Latin American states to protect its interests) can most effectively be constrained—and bipartisan consensus promoted-by issue-specific security regimes that reduce confusion between U.S. political goals and Latin American countries' security concerns. Lowenthal's essay convincingly demonstrates why, even after the disappearance of "the Soviet threat" in the Western Hemisphere, Latin America remains of vital importance to the United States. Among other reasons, hemispheric states are bound by issue agenda (migration, drug trafficking, environmental problems) that increasingly link different countries' domestic and foreign policies.

The introductory essays offer both useful historical background on inter-American political and economic relations and an assessment of the specific challenges that will confront Latin American and U.S. policymakers during the 1990s. However, they could have made an even stronger contribution by identifying more clearly the general principles that should guide U.S. and Latin American foreign policymakers now that the Cold War is over. The question whether existing inter-American institutions are capable of promoting cooperation and limiting conflict in this new era also merits further

The second part of this volume consists of essays examining domestic political trends in Latin America and specific policy areas in inter-American relations. The chapters by Rosario Espinal and Marcelo Cavarozzi analyze, in Latin America the evolution of the political Right and Left, respectively. Attention to changes in Latin American countries' domestic political situation is especially welcome in a book on U.S.—Latin American relations, and these essays offer far-ranging assessments of recent developments on the Right and the Left. Cavarozzi is, moreover, particularly effective at capturing the interplay between international conditions and domestic political change in the region since the 1930s.

Other authors assess the evolution of the Latin American debt problem in the 1980s (Riordan Roett), U.S.—Latin American trade relations (Roberto Bouzas), the issue of military involvement in Latin American politics and U.S. policies concerning democracy and human rights (J. Samuel Fitch), U.S. and Latin American policies on drug trafficking (Bruce Bagley and Juan Tokatlian), environmental problems (Steven Sanderson), and migration issues (Robert Bach). In addition to

providing comprehensive analyses of the main issues in these different areas, these chapters identify many of the unresolved dilemmas that will confront U.S. and Latin American decision makers during this decade. Bagley and Tokatlian, for example, show that despite a growing regional consensus in the 1980s that drug smuggling constitutes a major societal and national security problem, U.S. policy has lacked legitimacy and credibility because it is based on an inappropriate conceptual definition of the problem and a counterproductive U.S. preference for unilateral, often military, actions to resolve it. Bach demonstrates how domestic politics has influenced U.S. immigration policies over time, how these policies and other U.S. foreign policy goals are linked, and how U.S. policies have shaped migratory flows from Latin America.

In sum, the editors and contributors succeed admirably in assessing the foreign policy consequences of major changes in the international arena and in the domestic politics of hemispheric states, new sources of complexity in U.S.–Latin American relations, and potential sources of future cooperation and conflict. The book is a significant addition to the scholarly literature on inter-American relations. It is also an important resource for graduate and undergraduate teaching.

University of California, San Diego KEVIN J. MIDDLEBROOK

The New Cold War? Religious Nationalism Confronts the Secular State. By Mark Juergensmeyer. Berkeley: University of California Press, 1993. 292p. \$25.00.

This is an interesting book on a topic of contemporary concern. The rise of various ethnic and religious movements, which are challenging traditional authorities in many countries of the Second and Third Worlds, has led to the fear that the West faces a new confrontation with various forms of religious fundamentalism. The author does not like the term fundamentalism because it is pejorative, "is an imprecise category for making comparisons across cultures," and does not carry any political meaning (p. 5). Instead, he contrasts what he prefers to call religious nationalism with secular nationalism and, in a series of chapters, shows how the former has challenged the latter in a number of countries in the Middle East, South Asia, and the formerly communist countries in Central Asia and Eastern Europe. Then, in successive chapters, he addresses the questions, Why does religious nationalism turn violent? Is a religious state compatible with democracy and the maintenance of human rights? Can the West live with religious

The author sees the rise of religious nationalism as a reaction to the perceived failure of secular nationalism to deliver on "its promises of political freedom, economic prosperity, and social justice" and to the moral corruption secularism is claimed to have engendered (p. 23). He attempts to set the conflict between secular and religious nationalism in the perspective of the history of ideas, as well as Western history. This is the least satisfactory part of the book and seems jejune by contrast with the discussions of nationalism by Berlin in Against the Current, and Plamenatz in Kamenka's collection, Nationalism, and with the different strands of thought that have contended historically in the forma-

tion of the European state discussed by Oakeshott in his On Human Conduct, and, more recently, his Harvard Lectures, Morality and Politics in Modern Europe.

The most interesting chapter is the one in which he examines the reasons for violent religious confrontations and argues: "One can think of religious warfare as a blend of sacrifice and martyrdom . . . But behind the gruesome litany is an idea that encompasses both: . . . the dichotomy between the sacred and profane. This great encounter between cosmic forces—an ultimate good and evil, a divine truth and falsehood—is a war that worldly struggles only mimic" (p. 155). He also argues that the modern religious state need be neither antidemocratic nor against "the minimum definition of human rights—the notion that people should be able to reside peacefully alongside each other in dignity and with personal security" (p. 186). He makes a distinction between modernity, which religious nationalists are happy to embrace, and modernism ("the ideology of individualism and a relativist view of moral values, 191), which they are not. The religious nationalists are unlikely to support the "libertarian version of individual rights. . . That difference is so deep and abiding that it will not be easily resolved" (p. 189). But ultimately he thinks religion and reason, even if embodied in different nation-states, can coexist, and hence does not foresee any real danger of a new Cold War.

The main competitor of this volume is the second volume of the monumental study of fundamentalism organized by the American Academy of Arts and Sciences (AAAS), Marty and Appelby's collection, Fundamentalism and the State. Though the volume under review does have the merit of the greater coherence of a volume written by a single hand, it loses somewhat in terms of the richness of the AAAS volume. Also, it misses some important nuances. For instance, an important theme in the politics part of the AAAS volume is a distinction between the sectarian state and the nation-state, which leads to a finding that religious fundamentalists are much more likely to be successful in capturing the former. Moreover, the author virtually ignores the economic failures and successes that have distinguished states where fundamentalists (a term I still prefer to nationalists) have been resurgent from those where they have not. For instance, why have East Asia and the more successful countries in Latin America not seen a rise in religious fundamentalism? There is a storyline that can tie up all these loose ends. But even if Jurgensmeyer has not written the definitive book on religious fundamentalism, it is good to have some of the hysteria that has surrounded the subject in official circles and the media effectively dispelled.

Protecting Markets: U.S. Policy and the World Grain Trade. By Ronald T. Libby. Ithaca: Cornell University Press, 1992. 152p. \$26.50.

Regulating Unfair Trade. By Pietro S. Nivola. Washington: Brookings Institution, 1993. 190p. \$31.95 cloth, \$12.95 paper.

These two short books provide considered, scholarly examinations of U.S. efforts during the 1980s to counteract objectionable trading practices of other countries and ensure a "level playing field" for U.S. firms. Al-

though both hedge their bets, their conclusions are at odds.

The Nivola volume is broader and more comprehensive and carries its analysis closer to the present. It provides a partial answer to a key question: If trade negotiations under the GATT were so successful, why is the world slipping toward increased protectionism and perhaps even a trade war? Nivola's basic thrust is that trade regulation is being asked to do to much. Policymakers are unlikely to be able to fix broad macroeconomic failings simply by stiffening U.S. trade regulations. In effect, Nivola urges that trade policy actions ought to be aimed at remedying trade problems. He offers policy suggestions that the United States might adopt to refocus attention on open markets in reality, not just in rhetoric.

Sequential rounds of GATT trade negotiations made it politically unfashionable to maintain high tariff barriers. So to protect and encourage domestic industries, many countries started relying more on nontariff barriers. Frustrated, U.S. legislators demanded that in the name of equity, fair trade take precedence over free trade as the central U.S. trade objective. Their challenge was to help their beleaguered constituents without resorting to overt protectionism. To accomplish this task, the United States filed a growing number of antidumping suits and countervailing duties, negotiated many new orderly marketing arrangements and voluntary export restraint programs, and experimented with new approaches such as the Super 301 program and the Structural Impediments Initiative.

Legislators did not want to be portrayed as protectionists, so they instead tried to aid firms and workers injured by unfair competition. Nivola reviews both congressional and presidential initiatives. On the legislative side, the march from the watershed Trade Act of 1974, to the Trade Act of 1979, the Trade and Tariff Act of 1984, and (finally) the Omnibus Trade and Competitiveness Act of 1988 are summarized. At the same time, the increasingly activist intervention by the executive branch (sometimes in collaboration with Congress) is described. Still, by the mid-1980s it was clear that the international competitiveness of the U.S. automobile, steel, footwear, and textile industries was still poor.

What is largely absent from this analysis is a serious examination of the areas in which the United States experimented with new ways of encouraging freer trade, particularly with regard to so-called new issues and in smaller forums. As this volume makes abundantly clear, there is no such thing as a coherent trade policy. Thus, greater attention to U.S. efforts to liberalize trade in services and develop new understandings covering the protection of intellectual property and the handling of trade-related investment measures would have complemented the analysis. And consideration of the efforts by the Reagan, Bush, and Clinton administrations to achieve free-trade agreements with Israel, Canada, and Mexico are absent.

Still, there is an elegant power in Nivola's argument that builds with simplicity, logic, balance, and ultimately deliberateness and reasonableness. Nivola sets out to make his point and moves step by step through his argument. Nothing is rash, nothing is surprising. There are no bombshells as the weight of the argument builds steadily with each chapter. Nivola shows how the U.S. executive and legislative branches set about to remedy the perception of foreign unfairness and bolster flagging

American confidence (most often without requiring U.S. firms to correct their wayward habits). One result was a proliferation of moves to try to remedy unfair trade practices. Another result was the politicizing of U.S. trade policy. Indeed, the full-court political press, in the light of tremendous public scrutiny, that was necessary to persuade Congress to ratify the North American Free Trade Agreement is a perfect illustration. Until recently, such an agreement would have passed Congress easily without fanfare.

The recommendations offered by Nivola are modest and sensible, if unsurprising. He dismisses the idea that the United States should simply abandon efforts against unfair trade as politically naive and unrealistic. But he worries that crafting a consistently successful strategic trade policy is beyond the ability of government officials. He concludes rather tamely that the United States needs less dead-end moralism and that it should go back to basics. It "ought to keep pressing for equitable rules of commerce abroad but also carry out economic changes needed to make government a better partner of industry at home" (p. 142).

By contrast, Ronald Libby's Protecting Markets is a narrow case study that examines whether the Export Enhancement Program (EEP) adopted by the Reagan administration in 1985 to subsidize U.S. agricultural exports could be counted as a successful experiment in mercantilist trade policy. Libby states that the EEP was designed to restore U.S. grain markets that had been lost to unfairly subsidized European Community grain exports and to increase Europe's financial burden under its Common Agricultural Policy (CAP), thus diminishing its ability to engage in a subsidy war with the United States. The idea was to win back markets and to create such high levels of tensions within the European Community-particularly between the United Kingdom and France—that the Community would agree to negotiate reduced agricultural subsidies within the context of the Uruguay Round of multilateral trade negotiations in the GATT. Libby concludes that this goal was met-that Europe agreed to negotiate to reduce trade barriers under the pressure of discriminatory trade measures imposed by the United States.

This is a curious, slim volume with much to commend it, but its specific conclusions are ultimately unconvincing. This makes it hard to generalize from them. The book provides a careful, detailed analysis of political economy of U.S.–French (more than European) rivalry to capture cereal export markets for their producers. It shows how European (particularly, French) exporters aided by huge subsidies under the CAP displaced U.S. farm exports in the two decades preceding 1985. The interactions among France, Germany, and the United Kingdom with regard to agricultural trade are examined in detail.

In the 1980s, the United States started to act more forcefully to counter the loss of agricultural markets: "From the EEP's inception until October 1991, 119 export initiatives were approved by the USDA involving 80 countries and twelve commodities" (p. 53). The description and analysis of the continuing tussle between the United States and Europe in the mid-1980s, just before the designation of agriculture as a central agenda item of the Uruguay Round negotiations, is the best part of the book. Sadly, there is meager examination of the intricacies of negotiations on agriculture during the trade round itself.

Libby's claim that the EEP was an effective mercantile policy depends on whether or not you are a U.S. agricultural exporter. The United States did at least temporarily regain some markets for U.S. exporters, in part because of the EEP; but American taxpayers footed the bill for almost \$3.8 billion from 1985 to late 1991. Ironically, Cargill, the largest single U.S. beneficiary, consistently opposed the program but was nonetheless awarded nearly \$700 million in bonuses between 1985 and 1991. Some citydwellers might consider this a high price to pay to U.S. agricultural interests just to get the European Community to talk about agricultural subsidies, particularly if larger supplies in the United States might have kept prices lower. Moreover, farmers could well conclude that it was better to keep the subsidies provided under the EEP than to try to compete in an unsubsidized world. Even the Blair House compromise, which may help conclude the Uruguay Round talks (which took place after this book was completed), involves only small concessions by the French and ones that they would like to revisit.

Indeed, Libby undercuts the life of his own case for mercantilist intervention when he cautiously (and probably correctly) concludes, "Although the EEP was effective as a diplomatic bargaining tool only when U.S. grain supplies were large, world prices low, competition keen, the value of the U.S. dollar low, and most crucially political tension over the burgeoning CAP budget high, a U.S. recovery from the drought and renewed political tensions in the EC undoubtedly will make the Export Enhancement Program an effective lever in future GATT negotiations" (p. 130). That is a thin reed on which to advocate renewed mercantilism. Overall, score one for Nivola.

University of Southern California

JONATHAN D. ARONSON

Gendered States: Feminist (Re)Visions of International Relations Theory. Edited by V. Spike Peterson. Boulder: Lynne Rienner, 1992. 225p. \$32.00 cloth, \$16.95 paper.

Gendered States provides an important critique of international relations theory by problematizing one of the theory's most central and privileged concepts, the state. The book provides critical analysis and deconstruction of the relationship between gender and a number of global issues, including security, sovereignty, and revolution. The contributors uncover the centrality of the too-littlequestioned conceptualization of the state to traditional international relations theory and unmask the gendered privileges that states accord select men. Many problems associated with international-relations theory's conceptualization of the state-including how the state oppresses, degrades, and even coopts women to maintain and reproduce itself and expand its will around the world-are highlighted. The contributors, mostly feminist international-relations scholars, argue that a feminist analysis of the state and international-relations theory is central to an understanding and recreation of the world system. Consequently, the authors attempt to go beyond critique by furnishing a discussion of what they envision as significant aspects of a feminist international-relations theory

The volume's strength lies in its analysis of the impact

of the gendered nature of state formation, maintenance, and reproduction. This is done through three analyses: one focuses on the parallels between early Athenian and modern state formation, highlighting the differential roles (and corresponding power positions) accorded to men and women; one, on the continual oppression of women after modern revolutions; and one, on the lack of a feminist consciousness in the testimonies of contemporary military women coopted into the masculine culture of military service. These analyses convincingly show the state's historical and continued dependence on gender differentiations and the centrality of women and women's roles to global politics.

While the chapters make strong arguments for the importance of "taking gender seriously," the volume itself fails to take race, class, culture, sexuality, and other intragender differences seriously. Instead, the contributors privilege the history and experiences of select European women; and most chapters fail to include any serious analysis of the experiences of women of diverse backgrounds within and across states. At the same time that the volume challenges the masculinist account of political identity, autonomy, and community grounded in international relations theory, it replaces that account with accounts primarily based on the experiences of historically privileged European women. Most of the contributors assume-and at times suggest-that the developmental logic of the state and its corresponding subjugation are the same for all women, people of color, people of the lower classes, and people with alternative sexualities. This assumption results in the denial of differences in the oppression experiences of diverse peoples and obfuscates the role that states may accord some privileged women in the oppression of nonprivileged women, people of color, and poor people. The volume perpetuates the myth of the comprehensiveness of Western feminist analysis—similar to the myth of the comprehensiveness of realist analysis in internationalrelations theory.

Ŷ

The volume raises questions whose answers may lead to a feminist revision of international-relations theory. The contributors (re)vision goes beyond simply adding women to the study of international relations. It contests many of the theory's foundations—including theoretical justifications for, and the practice of, utilitarian autonomy—and argues, instead, for "relational autonomy" between parties in the conduct of world politics. It argues for selectivity, by the exclusion of coopted female experiences, in the collection of women experiences on which to build its theory. It argues for the acknowledgement and analysis of the interconnections of gender, family, states, and revolution. It argues for the ecofeminist lenses of "fractious holism" that reject the appropriation and exploitation of women and nature. It argues for the rejection of notions of political identity as sacrifice. Most intriguingly, it argues for the maintenance of a much-revised liberal state where difference is not shunned and minorities are accorded political voice.

Even with these revisions, one wonders what a feminist international-relations theory inclusive of race, class, and sexuality would entail. Clearly, such a theory will have not only to uncover the multifaceted array of privilege, power, and hierarchy within and across states but also to explain how these oppressive structures of the world system can be dismantled and changed. Gendered States provides a sneak preview of what the underlying basis of a revised theory of international

relations should include. What the field may well need, however, is a new, not a revised, theory of international relations. In a time when very few of the immense global problems facing the world's peoples (over 50% of which are a diverse group of women) have gone unanticipated by international-relations scholars, movements to refine and redefine international-relations theory are necessary. Gendered States provides an initial blueprint of the kinds of questions a new theory of international relations must answer if we are to make any sense of the global village we live in.

Purdue University

PATRICIA T. MORRIS

Waiting for the Millennium: The United Nations and the Future of World Order. By J. Martin Rochester. Columbia: University of South Carolina Press, 1993. 347p. \$39.95.

There are several paradoxes associated with the United Nations. The organization has always been the object of contradictory attitudes: at the same time that many pin their hopes for world peace and security on the United Nations, others discard it as irrelevant and superfluous or even harmful and dysfunctional. Whereas summary judgments about the merits or demerits of the United Nations tend to be based on the organization's activity in the peace and security field, three-fourths of its resources are used in economic, social, and technical areas. Moreover, there is a wide gap between expectations and resources: the organization that is supposed to be the guarantor of peace and world order has an annual regular budget smaller than that of the New York City Police Department.

While noting such contradictions, Martin Rochester's study proceeds from another paradox. At a time when profound global changes have revived optimism about the future of the United Nations, international-relations theory is pervaded by an unprecedented skepticism toward the prospects of international organization. The regime literature is the specific target of Rochester's dispute with contemporary scholarship. His criticism is sometimes overstated, and his claim that scholars studying the United Nations have risked "pariah status in the international relations fraternity" is clearly exaggerated (p. 245). At any rate, Rochester proffers an alternative institutionalist and globalist approach to international order.

Trying to steer a course between "bad idealism" and "bad realism," the author launches an inquiry into the growth potential of global organization as one component of the quest for world order. He urges us to think of international system transformation as political development, understood as the cultivation of a world order that combines stability with adaptability. Adopting Karl Deutsch's terminology, he envisions a progression toward a global, pluralistic security-community. Rochester argues that the prerequisites of global institution building—a systemwide crisis and a critical mass of actors with the will and power to move the system—are present today. The main problem, in his view, is not a power vacuum but a leadership vacuum.

Rochester's assessment of the UN system starts with an overview of prominent shortcomings, including the lack of coordination between the specialized agencies, the fact that the politics of agenda setting tends to be divorced from the rest of the policy process, and the discrepancy between egalitarian voting rules and power inequalities among UN member states. This is followed by a thorough account of various reform proposals through the years, which shows a pattern of recycled ideas skirting the edges of institutional change.

Finally, Rochester offers a series of prescriptions based on a model of "dirigible pluralism" featuring subsystem autonomy within a central guidance system built around the United Nations. His reform proposals lean more toward "tinkering" than "rethinking" (to use the author's own terms). They can be realized with only marginal revisions of the UN Charter. First, Rochester recommends a number of measures to professionalize and depoliticize the UN Secretariat, including improvement of the secretary general selection process, more systematic use of competitive exams in recruiting personnel, centralization to a smaller number of superdepartments headed by Deputy Secretaries-General, and better intelligence capability through the creation of global-watch structures. Other prescriptions concern improved interagency coordination through the appointment of lead agencies and operations boards for specific functional area, budget process reform, and the restitution of ECOSOC to a pivotal role in bringing the programming and financing tracks closer together.

How, then, can such reforms be implemented, given the dismal track record of UN reform? Rochester envisions a trade-off—or enlightened, concert-of-powers approach—whereby major donors convert voluntary fundings into assessed funding in return for greater control

over the budget process.

Waiting for the Millennium is an informative, cogently reasoned, and (in many respects) impressive book. Its greatest merit is that it makes a conscious effort to embed the study of the United Nations in international relations and organization theory. In his ambition to recapture for international organization the high ground now held by regime theory, Rochester tends to spread his forces somewhat thin. His analysis ranges from broad macro levels (system transformation, world order) to narrow micro levels (organizational engineering); and he has descriptive, as well as normative, aspirations. The frequent quotes and references to an array of more or less relevant sets of literature underscore the eclectic character of his endeavor.

One limitation of Rochester's analysis is his preoccupation with formal organization. It has often been said that the great value of the United Nations has less to do with what goes on in formal sessions than with the fact that the UN headquarters is a unique conglomeration of diplomats from virtually every country in the world, who can meet informally in various constellations without publicity. Similarly, interagency coordination is often facilitated by the emergence of informal networks, whereas formal designations of a specific lead agency (one of Rochester's prescriptions) tend to aggravate organizational jealousies and turf battles.

By training his searchlights on the intergovernmental organizations (IGOs) of the UN system, Rochester leaves nongovernmental organizations (NGOs) in the shade. This also means that he underestimates the importance of IGO–NGO links in international cooperation. To produce action—to implement policies—NGOs are often needed. They are particularly significant when dealing with issues that span international and community levels and where reaching into societies is of utmost importance. (Population and AIDS are examples

in point.) Moreover, NGOs are not as easily paralyzed by claims to state sovereignty as are IGOs. Unfortunately, IGO-NGO links are mostly weak, and much remains to be done to overcome the gap of mutual distrust separating IGOs and NGOs in various issue areas. To establish arenas and channels for IGO-NGO coordination should therefore be part of the reform agenda.

In sum, Waiting for the Millennium is a useful antidote to the atheoretical, descriptive works on the United Nations whose ranks will no doubt swell further as the organization approaches its fiftieth anniversary. With its rare combination of theoretical anchoring and operative proposals, this book will be of interest to scholars, as well as practitioners, of international organization.

University of Lund

CHRISTER JÖNSSON

The Elusive Transformation: Science, Technology, and the Evolution of International Politics. By Eugene B. Skolnikoff. Princeton: Princeton University Press, 1993. 322p. \$39.50.

This book offers a very well written and thoughtful overview of the likely impacts of science and technology on international politics. Written as an extensive personal reflection by someone who has studied these issues for more than three decades, it bounces off of—and avoids—many of the more glib and startling predictions that have been made about such impact, concluding that science will probably not induce revolutionary changes in the international system of separate national sovereignties.

Skolnikoff surveys just about all the possible areas normally collected into "science policy," including broad issues of arms control and information management and, more generally, international economics. It includes discussions of demographic issues and of the possibilities of ecological damage, including, in particular, global warming. While not written as a text, the book would serve admirably for courses on science and public policy as an antidote to the exaggeration and hyperbole one often finds in this field. The author definitely sounds a warning that current political arrangements may be deficient in handling the complexities of rapidly evolving technologies; but at the same time, he stops short of concluding that such political institutions will respond by accepting major changes.

The book is very rich in citations of other literature and of relevant aggregate data. In its discussions of domestic economics and international economics, it wanders, at points, beyond what one might have regarded as science and technology policy more narrowly and precisely defined. The author endorses the general proposition that the pace of scientific development is much more rapid than in the past, thus confronting us with very different phenomena and problems. Yet the coverage is again a little too broad to fit entirely with this characterization. For example, Skolnikoff cites the AIDS epidemic as one problem that might, indeed, require more revolutionary responses but at the same times notes the analogy to the plague and other epidemics that hit the world a long time ago. Similarly cited is the possibility of an asteroid's striking the earth, which, again, may have happened with dramatic consequences in the past (though long ago).

The authors' sweep is thus broad enough to include somewhat more than what is new and different for the late twentieth century. Yet his general conclusion still seems very thoughtful and well grounded, namely, that there have been too many predictions by which what is indeed new and different about our science and technology will require—and will cause—very new and different political arrangements.

Skolnikoff presents a very issue-driven analysis of politics—as science and technology are the independent variables, and politics the dependent. A reader looking for extended discussions of the internal processes of government agencies handling these issues may thus be slightly disappointed. The book offers some wise observations about the roles and limitations of intergovernmental and nongovernmental organizations and of the future of collective security, set against the continuing debate between "liberal" and "realist" analyses of international relations. It is very sensible and clear-headed in its discussion of military issues and arms control.

The most salient conclusions that Skolnikoff offers are not so very startling, namely, that command economies are doomed in being the least able to handle the complexities of modern science and technology and that the flow of information across boundaries will make it increasingly difficult for *all* governments to constrict such information. Skolnikoff advocates, (but not with excessive vehemence) policies of "targeted research and development."

Yet the overall thrust of the book is, indeed, that the most startling conclusions are likely to be wrong here and that this work, indeed, catalogs a great number of such conclusions that seem to be more wrong than right.

Ľ

George H. Quester

Coping with Complexity in the International System. Edited by Jack Snyder and Robert Jervis. Boulder: Westview, 1993. 366p. \$60.50.

In the 1960s, academic students of international relations frequently spoke and wrote about "the international system" and "systems theory." In the reader that virtually defined the field at the end of that decade, James Rosenau, declared that "of all the advances that have occurred in the study of international phenomena, perhaps none is more important than the ever-growing tendency to regard the world as the international system" (International Politics and Foreign Policy [1969], p. 71; original emphasis). Students of world politics became familiar with concepts such as system dominance, feedback, and equilibrium.

Although the language of systems became a conventional way of describing international politics, none of this work led to general explanatory theory. Indeed, during the 1970s, behavioral systems theory became unfashionable, overshadowed by Kenneth N. Waltz's powerfully argued reformulation of realist theory (*Theory of International Politics*, 1979). Discussions of general systems theory and cybernetic approaches to international politics were replaced on graduate reading lists with arguments for and against Waltz's neorealism.

For the last decade or so, increasing discontent has been expressed with neorealist theory. Elegant though it surely is, it seems to explain little of what puzzles us about world politics—both because strategic interaction among small numbers of actors has a high inherent degree of indeterminacy and because neorealism omits so much of what is significant in world politics (e.g., variation in information, institutions, patterns of economic interdependence, and domestic politics). That neorealism is "too parsimonious" and underspecified has become a constant refrain in the field.

Coping with Complexity adds the voices of 13 authors mostly associated with Columbia University-to that chorus. (Unfortunately, the volume contains no information about their affiliations or other accomplishments, except for the editors, who are well known.) Jack Snyder's introduction writes of "new thinking" about the international system, which sounds remarkably like the thinking of the 1960s: the world is complex, and many variables matter. Snyder does make an interesting point about complexity: Waltz's system is one of "disorganized complexity" with a small number of actors, but the complexity of world politics is actually largely "organized complexity," because states are "part of a hierarchical, organized system when facing their own societies" (p. 11). In the essay that provides the theme for the volume, Robert Jervis emphasizes the frequency with which action in world politics, as in other systems, has unintended consequences and provides numerous fascinating examples to support this undoubtedly correct proposition. Thomas Christensen, in the conclusion to the volume, uses some of the contributions in it to comment once again (as Eurocentric, historically oriented political scientists of the 1960s did) on the failure of such policies as those of the allies toward Germany after World War I. Except for the references to Waltz's theory, all of these ideas would have been familiar to students in international-politics seminars during the early 1960s.

Although this book hardly puts forward a theory, its contributions all purport to be informed by the systems perspective or what Paul Schroeder describes as "the general theme of this book, linear versus systemic thinking in international politics" (p. 48). The thread connecting the chapters is provided by Robert Jervis's essay, which focuses on the "perverse effects" of actions within a systemic context. Jervis does not provide a systematic statement of what he means by systems effects; but from his discussion and examples, it seems clear that he wishes to emphasize unintended and unwanted consequences resulting particularly from strategic adjustments. For instance, a state's purposive behavior may be thwarted by reallocation of others' resources or by the formation of new coalitions; that is, Jervis is concerned with the ways in which systems can produce countervailing actions. Unlike linear thinking, systemic thinking anticipates these countervailing actions and leads to more appropriate behavior.

Unfortunately for the coherence of this volume, its contributors have several different conceptions of what constitutes systemic thinking or, more broadly, systemic effects. A variety of interaction effects nestle beneath the systemic umbrella. Schroeder's fascinating essay on eighteenth- and nineteenth-century diplomacy does follow Jervis's theme; Kathleen McNamara's discussion of the European Community's Common Agricultural Program emphasizes unintended effects; and Randall Schweller's chapter on Hitler's strategy focuses on coalitional dynamics. But Jonathan Mercer's essay defends linear thinking against too great a preoccupation with reputation, and Susan Peterson focuses on bilateral

diplomacy between Britain and Russia before the Crimean War; her systemic effects refer to links between international and domestic politics, not countervailing strategic action. William McNeil focuses on the *cognitive* complexity of the war debt–reparations–loans–domestic politics system of the 1920s, which be believes Weimar's leaders failed to understand.

William Daugherty, Jeffry Frieden, and McNamara describe self-reinforcing systems that display the opposite property of that discussed by Jervis: reinforcing spirals of cooperation. (The Concert of Europe, the classical gold standard, and the Single European Act are the cases in point.) On the other hand, Richard Betts-in an updating of the critiques of collective security a generation ago by Inis L. Claude and Arnold Wolfersagainst easy expectations that maintenance of collective security under benign conditions will contribute to success when real threats develop. Anne Uchitel's chapter misinterprets Keohane and Nye's Power and Interdependence (1977) as claiming that interdependence enhances systemic stability and, in proceeding to argue that dependence can create instability, entirely ignores the theory of lateral pressure of Nazli Choucri and Robert C. North (Nations in Conflict, 1975).

Clearly all of the dynamics discussed in this book are systemic in some sense (they depend on interaction effects that would not be present were only two unitary actors involved), but to recognize this similarity is to suggest how uninformative a mere focus on systems is. If it is a platitude that world politics constitutes a system, we should hardly be surprised when a book resting on this recognition does not yield new insights. There are worthy contributions in this volume (the chapters by Schroeder, Mercer, Frieden, Betts, and McNamara are particularly interesting); but the editors' framework, with its systems approach, is not sufficiently precise to give the book much unity. As Jervis and other contributors admit, the systems approach is more an approach than a theory; it does not yield clear hypotheses, although decision makers' awareness of systems dynamics may "reduce the incidence of perverse effects somewhat" (p. 43). Coping with Complexity is more valuable as a reminder of what we have long known but are perhaps prone to forget than it is as an innovative contribution to theory and research.

ROBERT O. KEOHANE

The Elusive Balance: Power and Perceptions during the Cold War. By William Curti Wohlforth. Ithaca: Cornell University Press, 1993. 317p. \$39.50 cloth, \$16.95 paper.

Wohlforth argues that general international-relations theory has failed to progress because of ambiguities in the central concept of power. It is difficult, for example, to test the hypothesis that the system automatically returns to equilibrium when international-relations specialists make contradictory estimates of the distribution of power for the same time period. Even quantitative measures of power contain so many disparate elements such as military, technical, economic, population, and national resources that the analyst can achieve practically any desired result merely by selecting the correct indicators. Wohlforth comes heretically close to suggesting that there is no objective underlying distribution of

power—hence his title. Even a major war does not reveal states' relative capabilities, because wars are often ended by negotiation; and the relative influence of particular states on the postwar settlement may have more to do with expectations about the postwar hierarchy of prestige than about reality.

He reasons that if power influences international politics, it must do so mainly through the perceptions of people who make decisions on behalf of states. For each major historical era between 1945 and 1989, Wohlforth discusses Soviet views of the elements of power, the distribution of power, the mechanics of the balance of power, and the hierarchy of prestige. He also examines United States perceptions, though rather superficially.

The book provides a very useful and lucid synthesis of the many arcane yet consequential debates among Soviet ideologists and theorists over international relations. It should become a standard reference source for historians and political scientists, because it brings together the insights of many different Kremlinologists, shows where they disagree, and presents the most recent consensus of opinion.

Wohlforth is also more tangentially interested in evaluating various explanations of Soviet foreign policy learning. How could the Soviets pursue a set of foreign policy ideas that isolated them from the rest of the world and directed them to seek additional territory and influence, at the cost of provoking a hostile balancing coalition? He presents a fascinating account of the incubation of *perestroika*, making a good case that Soviet learning was not inevitable. New ideas about foreign relations were available from academics from 1980 to 1985, but among the Soviet political elites, only Mikhail Gorbachev was listening.

Experts on the former Soviet Union are engaged in a debate, going back to Barrington Moore and George F. Kennan, over whether Soviet foreign policy was primarily motivated by external influences, such as a hostile international environment, or by internal causes, such as factional maneuvering within the Kremlin or the need to build a coalition among various elite groups. Wohlforth presents a more sophisticated interactionist view, whereby foreign policy beliefs are a response to environmental challenges and opportunities but may also serve domestic political purposes. That particular ideas were useful to Stalin in his struggle with political opponents does not mean that the Soviet leader did not believe them. Wohlforth points out that the feedback from their policies was irregular or ambiguous or seemed to confirm erroneous Soviet beliefs, at least in the short term.

In flowing prose, Wohlforth presents many creative and insightful interpretations of Soviet rhetoric and the disjuncture between self-presentation and reality. Particularly interesting is his account of how Gorbachev coped with the decline of the Soviet empire and the collapse of its superpower status by trading in Soviet military chips to achieve arms control agreements, stressing global interdependence and the irrelevance of military power, and by claiming that world stability required a strong, democratic, united Soviet Union.

Wohlforth does not always give sufficient weight to the possibility that the Soviets used public estimates of U.S.-Soviet power relationships for strategic purposes. When the Soviets were vulnerable to a U.S. nuclear strike in the Stalin and Khrushchev eras, how likely is it that Soviet leaders would publicly admit their military inferiority to the United States, particularly when the Eisenhower administration maintained a declaratory policy of responding to communist aggression with "massive retaliation?"

He is too inclined to accept the realist view of the Cold War as a power struggle between the challenger Soviet Union and the dominant United States. There is little reliable evidence, for example, that Stalin was dissatisfied with the postwar settlement or felt that Soviet influence on diplomatic arrangements was incommensurate with their contribution to winning the war against Germany. Stalin achieved just about everything he wanted in Europe. Confronted with the fait accomplis of the Soviet Army, Winston Churchill and Harry Truman found it difficult to oppose Soviet territorial objectives, absorption of the Baltic states, and demands for "friendly governments."

Rather than seeking prestige commensurate with their military power, the Soviets often took apparently belligerent actions in response to such threatening Western actions as the establishment of a West German state, the creation of a peacetime military alliance, and the rearmament of Germany. By focusing solely on perceptions of power, rather than state interactions, Wohlforth overlooks the role played by mutual mistrust, the security dilemma, and conflict spirals in exacerbating Cold War tensions.

He reveals many anomalies in the balance of power that are either ignored or deliberately slighted by hardnosed realists. For example, states do not always balance against would-be challengers. The Soviets' experience in the 1950s and 1960s supported the correlation-of-forces model, which held that overwhelming military power would compel capitalist states to seek a détente. More controversially, Wohlforth concludes that there is frequently a disjuncture between leaders' perceptions of relative state power and material reality in the form of measurable resources.

Neorealists will not be convinced by his analysis, because many argue that the objective distribution of power constrains and channels the behavior of states regardless of the beliefs and perceptions of national leaders. For example, Stalin may have depreciated the importance of nuclear weapons, but he refrained from interfering with the U.S. airlift and discontinued the Berlin blockade despite his failure to block the establishment of a West German state. Similarly, for all his boasts about Soviet missile capabilities, Khrushchev did not carry out his ultimata in two Berlin crises. The debate over the extent to which power is an objective constraint or a manipulable image continues.

DEBORAH WELCH LARSON

Engaging the Enemy: Organization Theory and Soviet Military Innovation, 1955–1991. By Kimberly Marten Zisk. Princeton: Princeton University Press, 1993. 286p. \$39.50.

Kimberly Zisk examines the conditions under which military organizations are likely to change military doctrines. She argues that "the timing and content of military doctrine innovations are a result of the interaction of international and domestic political factors, of foreign doctrine changes and of domestic civilians' political strategies" (p. 5). The argument is complex and is summarized in its hypotheses: military organizations "develop innovative doctrines on their own, in the absence of civilian intervention," in response to foreign doctrinal shifts that threaten their war plans; before reacting to these foreign threats, however, military officers attend to "domestic threats to their organizational health and autonomy first"; military officers are likely to offer innovations that augment military resources and autonomy, yet these innovations provoke debate within the expert policy community and the military only slowly institutionalizes them; changes in the composition of the policy community can change the nature of the doctrinal innovations (pp. 26–28).

Zisk presents a well-crafted project that draws on a rich theoretical tradition in order to derive hypotheses and then test these in cases that permit controlled comparison. The book's three case studies examine Soviet responses to the United States' doctrinal innovations, including reactions to flexible response, the Schlesinger doctrine, and air-land battle (or follow-on forces attack). The richest and most rewarding of these studies is the last: Zisk demonstrates how public discussion of national security issues changed as civilian analysts from the Academy of Sciences' institutes joined the policy community. She also illustrates the ingenious strategies used by these analysts to develop expertise and build bridges with professional military officers, despite the resistance of some in the military.

Zisk's work is part of the effort to apply social science theory to the analysis of military doctrines—an effort that began anew in 1984 with publication of Barry Posen's Sources of Military Doctrine and Jack Snyder's The Ideology of the Offensive. Zisk's foil is the proposition, inspired by Graham Allison's work on bureaucratic politics, that military organizations are conservative bureaucracies limited by their standard operating procedures and likely to innovate only in the face of defeat on the battlefield or under pressure from civilians (p. 3). She contends that an improvement over the bureaucratic politics model for understanding the military role in doctrinal change is the "policy community" model, in which "policy ideas percolate fairly freely" among experts "who interact with each other regularly to exchange ideas" and have access to decision makers (pp. 21-22). Zisk concludes by arguing that her findings support a new theoretical approach that rests on three central propositions: (1) that the influence of institutional and organizational interests on the beliefs or behavior of individuals is complicated by idiosyncratic factors; (2) that both international and domestic politics constrain the behavior of individuals and organizations; and (3) that policy outcomes are determined not only by interest groups but also by policy communities (p. 184).

Zisk's argument might be strengthened if she could give more conceptual and operational precision to her dependent variable, military doctrine. Zisk seems torn between arguing that doctrine is formulated by the state on the basis of information provided by the General Staff and that "doctrine formulation was controlled by the General Staff" (pp. 34, 43). Although the latter view is highly doubtful in the Soviet case, it is necessary for the author's major thesis that the military will introduce innovative doctrines on its own without civilian intervention. In the empirical studies, the author does not always identify either the official act that adopted a new doctrine or the content of that doctrine, so that what

should be the most important empirical finding in each case study is often hidden in a larger discussion of a debate among military professionals. For example, the author asserts that in 1965 Soviet military doctrine "apparently shifted," that by the mid-1970s it "appears" to have shifted again, and that in the early 1980s there were statements "probably indicating that some sort of doctrinal decision had been made"; but the evidence of official doctrinal pronouncements is not presented. Instead, the author appears to let the debate among military professionals and *institutchiki* stand as evidence of innovation in official doctrine.

Zisk's argument might be further strengthened if she could substantiate empirically or specify theoretically the causal link between doctrinal developments in the United States and the innovations by Soviet military officers. She does not give us standards by which we can judge whether Soviet doctrinal developments were, in fact, responses to American ideas, rather than the autonomous development of autochthonous doctrines. Zisk offers circumstantial evidence that the Soviet debates took place around the time of an American doctrinal shift (although some Soviet debates actually began before the American shift) and that some Soviet military writers, whether part of these debates or not, had taken note of the American shift. The case for a causal link might be strengthened by hypotheses that predict the type of response we should have expected from the Soviets (e.g., symmetrical vs. asymmetrical responses, compensatory vs. exploitative responses). Drawing on the work of Roman Kolkowicz (1970) and James McConnell (1985), such hypotheses could provide theoretical reasons for believing that observed doctrinal developments in the Soviet Union were reactions to U.S. innovations.

Zisk's work might be strengthened by some further attention to the larger domestic political arena in which these military debates took place. Throughout this study, the important invisible hand (invisible from the perspective of the hypotheses) is the Communist party leadership that made doctrine based on the technical information and military science provided by the General Staff (p. 34). It was these leaders who imposed doctrinal innovations in 1960 and in the early 1980s and then "snatch[ed] the reins of doctrinal initiation away from the Soviet military" in 1987 (p. 163). It was the politicians who decided to empower civilian analysts in the late 1980s and thus expand the policy community (p. 23). The hypotheses of this study might ask why the Communist party leadership adopted innovative military doctrines. Indeed, this work raises the question whether in societies with traditions of strong civilian control over the military, one can study doctrinal innovation by limiting hypotheses to the behavior of professional military officers or even policy communities.

These opportunities to strengthen or build on this project should not detract from the significant contribution that it makes to an important debate. Zisk's work reflects the maturing of our field of Soviet and post-Soviet studies, as scholars not only ask how the theories of political science's mainstream might sharpen area studies but also how insights from our case might advance theory. Zisk's work should be taken seriously both by those who seek keener understanding of Soviet military debates in its last three decades and by those who seek to sharpen the organization theory of military behavior.

ISSUES, CANDIDATE IMAGE, AND PRIMING: THE USE OF PRIVATE POLLS IN KENNEDY'S 1960 PRESIDENTIAL CAMPAIGN

LAWRENCE R. JACOBS University of Minnesota ROBERT Y. SHAPIRO Columbia University

Interpretations of electoral campaigns have pointed to two mutually exclusive strategies: candidates are expected to focus either on policy issues or on personal image. We argue, however, that social psychologists' notion of priming offers an empirically grounded and theoretically plausible campaign strategy for treating image and issues as interconnected strategic concerns. Based on both quantitative and historical analysis of John F. Kennedy's 1960 presidential campaign, we find that the candidate's policy positions were related to results from his private public opinion polls. Archival and interview evidence suggests that Kennedy deliberately used these popular issues to shape the electorate's standards for evaluating his personal attributes (rather than to win over utility-maximizing voters). We conclude that the study of priming offers one important approach to reintegrating research on candidate strategy and voter behavior.

nalysis of election campaigns typically assumes that rational candidates avoid taking divisive issue positions and instead craft ambiguous policy stances and attractive personal images of strength, boldness, competence, honesty, and trustworthiness (see Nie, Verba, and Petrocik 1979; Page 1978). Projecting favorable personal attributes and images is believed to offer a risk-averse strategy for holding together the party base and attracting wavering voters (Sniderman, Glaser, and Griffin 1990).

Ĩ.

This conventional wisdom developed in a reaction against the argument-often associated with the work of Anthony Downs (1957)—that officeholders should appeal to a self-interested electorate by concentrating on policy issues and, specifically, on minimizing the distance between their distinct issue positions and voters' policy preferences.1 Research by the personal attribute school has identified at least four reasons why rational candidates are expected to refrain from issue-based strategies: (1) the existence of multiple issue dimensions defies any office seeker's attempt to locate a position that will appeal to the median voter in all directions (but see Davis, Hinich, and Ordeshook 1970); (2) candidates are uncertain about their information concerning the electorate's preferences and their own ideal positions in relation to those preferences (Erikson and Romero 1990); (3) in this environment of uncertainty, candidates that announce definitive policy positions on conflictual issues risk alienating centrist voters; and (4) candidates are constrained in their position taking by ideologically oriented activists within the political parties (Kessel 1992; Page 1978).

However, empirical research, as well as recent economic and psychological theorizing suggest that candidates do not focus on developing a favorable personal image to the exclusion of position taking: policy stances and a candidate's personal image are not mutually exclusive bases for campaign strategy.

We draw on the social psychological process of priming as a way to understand the interconnectedness of image and issues in campaign strategy: this process suggests that candidates use popular policy issues to influence (or to "prime") the electorate's standards for evaluating their personal attributes. In particular, we focus on the case of John F. Kennedy's 1960 campaign and suggest that Louis Harris's innovative public opinion surveys heightened the Kennedy campaign's interest and skill in using position taking to shape the candidate's image. Harris's polls, which were privately conducted for Kennedy, offset a major deterrent of candidate position taking—limited information about voters' policy preferences. Our purpose is to use Kennedy's campaign to outline a candidate strategy that incorporates the public's policy preferences without ignoring the well established limitations on issue-based voting.

THE INTERCONNECTEDNESS OF ISSUES AND IMAGES

The study of campaigns can usefully draw on social psychologists' analysis of individual perception and, especially, on their distinction between the *availability* and the *accessibility* of public attitudes and information. This analysis holds that individuals have a set of enduring attitudes stored in their memories. Whether these attitudes are influential when a judgment must be made is determined by whether and how they are accessed or retrieved from memory (see Aldrich, Sullivan, and Borgida 1989; Iyengar 1990; Iyengar and Kinder 1987; Krosnick and Kinder 1990; Lavine et al. 1992). While some attitudes are frequently and consistently activated from memory, others are temporarily accessed because of immediate environmental stimuli.

Research has typically focused on the mass media

because it provides individuals with much of their information and therefore may be a primary stimulus for accessing attitudes. Indeed, studies of individuals have found that emphasis on a particular policy issue in the media may "prime" or temporarily increase the accessibility of these attitudes. For instance, as media coverage and discussion of health care reform increases the salience of the issue, the greater will be the probability that an individual's attitudes toward that issue (and perhaps related policies) will be activated and will become the standard by which he or she evaluates other attitude objects like candidates or related issues.

The process of priming, then, does not depend on altering an individual's policy preferences (e.g. converting supporters of health reform into opponents). Indeed, changing the public's policy preferences (especially during such short periods as an election campaign) is quite unlikely (see Campbell et al. 1960; Finkel 1993; Page and Shapiro 1992). Rather, priming involves a twofold process: (1) it sets the agenda by focusing public attention on certain topics, and (2) it provides the main basis for evaluation. Thus the messages communicated through and by the media during an election significantly influence which attitudes and information are likely to be retrieved or accessed from memory and incorporated into voters' judgments about, and ultimate choices of, candidates.

We propose to extend the application of priming from its original focus (the analysis of how individuals form attitudes and make decisions) to the study of candidate behavior. This new use changes the analytic focus from unintentional priming (i.e., the inadvertent impact of journalistic practices on voters) to intentional priming, namely, the deliberate strategies that candidates pursue to influence voters.³

The study of priming contributes to understanding candidate behavior by addressing three analytic obstacles to incorporating policy issues into campaign strategy: multiple issue dimensions, incomplete or imperfect information, and image-oriented campaign strategy.

First, research in the fields of psychology and political communication suggests that priming largely offsets the problem of multiple issue dimensions. Previous studies report that the media's attention to a specific issue activates existing attitudes on that policy or closely related attitudes on different policies; the effect is to crowd out other issues (Iyengar 1990; Iyengar and Kinder 1987). Ample studies of issue voting and campaign advertising confirm that focusing voters' attention on a few particular issues influences the importance that the electorate as a whole attaches to them (Aldrich and Alvarez 1992; Aldrich, Sullivan, and Borgida 1989; Berelson, Lazarsfeld, and McPhee 1954; Finkel 1993; Geer 1992; Nie, Verba, and Petrocik 1979; Petrocik 1991; Popkin 1991; West 1991).

A priming strategy is compatible, then, with a simpler and more realistic model of issue voting: when the electorate evaluates candidates, it neither possesses full information nor makes full use of the multidimensional space of issues. Rather, some issues are more important than others because priming prompts voters to gather readily available information on a few issues and to access a small subset of attitudes. The implication for campaign strategy is that candidates need not adopt issue positions that appeal in all directions: candidate appeals that activate existing attitudes on one policy issue suffocate or distract interest in other issues. In other words, campaign strategy involves the manageable task of influencing the weights voters attach to a few issues.

The second major obstacle to incorporating policy issues into campaign strategy is the risk associated with position taking in an environment of incomplete or imperfect information. One fundamental difference in candidate priming as opposed to media priming is that campaigns intentionally develop strategies to minimize risk and maximize benefits. The campaign's ability to prime voters to access stored information is constrained by several strategic (as well as real-world) considerations, including the risk that a candidate's position will generate new information and messages that alienate centrist voters.

Public opinion surveys, however, have bolstered candidates' confidence and sophistication in pursuing a priming strategy; the availability of measures of voters' concerns have mitigated candidate uncertainty over voters preferences and lowered the risk in basing a campaign on policy issues (Geer 1991). While candidates and presidents since Franklin Roosevelt have used scientific opinion surveys, John F. Kennedy's 1960 campaign introduced major innovations in terms of the number, structure, and political use of opinion polls (For the campaign's interest in simulation analysis, see Jacobs 1992b, 1993; Pool, Abelson, and Popkin 1964.)5 Interviews and archival evidence suggest that the Kennedy campaign commissioned and regularly used private, state-level opinion surveys conducted by Louis Harris. The polls included responses to an open-ended question regarding the most important problem facing the country. 6 Kennedy's private surveys of the public's policy goals were ideally suited to tracking the salience and accessibility of policy issues. Indeed, responses to the "most important problem" question are widely used in contemporary analysis of voters and priming's impact on them (e.g., Abramson, Aldrich, and Rohde 1991, chap. 6; Aldrich, Sullivan, and Borgida 1989).

Campaign records and interviews indicate that the Kennedy campaign sought to diminish its uncertainty regarding voters' preferences by adopting two innovations proposed by Harris: to poll in separate states and forgo national surveys and to avoid "separat[ing] our polling from the other problems of strategy." The political task of winning primaries and electoral college votes was closely related to polling that would, Harris explained to Kennedy, "tell you how . . . [a] critical state can be won." Harris's position within Kennedy's inner circle of advisers insured that polling information was incorporated into the campaign's strategy. In short, the Kennedy campaign committed scarce resources to

Harris's polls because they provided strategically oriented information on the policy issues that were salient and accessible to the average voter. The implication of Kennedy's campaign is that the priming concept is consistent with the information available to modern campaign organizations: extensive and sophisticated polling lowers a campaign's risk and enhances its skill in taking issue positions.

The third analytic payoff is that priming offers a theoretical framework for treating policy issues and candidate image as interconnected (rather than as conceptually distinct). When following a priming strategy, campaigns adopt a limited set of spatially distinct and popular issue positions. These policy stances are used by the campaign not as the exclusive basis of its strategy but as an instrument for emphasizing and thereby influencing the *standards* for evaluating a candidate's personal characteristics. A candidate's decision, then, to advocate a few popular issues adjusts the standards by which their leadership qualities will be perceived, evaluated, and judged. The strategic objective is to modify the public's evaluation of the candidate's image in order to widen the candidate's appeal.

A priming strategy does not require candidates to advocate positions the candidate actually opposes. Rather, it suggests that campaigns select a relatively few issues out of a large pool of acceptable possibilities for particular emphasis. In other words, candidate strategy involves strategic adjustments: highlighting a few policies by increasing the frequency, strength, and extensiveness of the candidate's statements.

Ł

Research confirms that campaigns face compelling reasons to combine strategic position taking with image building. A singular focus on policy issues runs into the well-known limitations of a strict Downsian strategy. But an exclusive focus on image is likely to frustrate voters who are quite interested in salient issues; the electorate's perception of candidate image does not occur separate from, or at the expense of, its policy preferences. Empirical studies have found that voters' perception of candidate competence or trustworthiness is associated with their policy preferences (Kessel 1992; Page 1978, chap. 8; Petrocik 1991; Popkin 1991; Rahn et al. 1990; Sniderman et al. 1990). In addition, recent models of campaign strategy suggest that when office seekers announce their positions, they "signal" or increase the perception of favorable nonpolicy characteristics (Banks 1991; Cameron and Enelow 1992). Priming, then, suggests an empirically grounded and theoretically plausible campaign strategy for integrating the public's policy preferences with the well-established limitations on issue-based voting.

We use John Kennedy's 1960 campaign to examine candidate strategy and behavior in modern presidential elections. We ask, Does the direct study of Kennedy's strategy suggest that the campaign depended exclusively either on the spatial positioning of its policy stances or on the shaping of the candidate's image, or did Kennedy (as we suspect) attach

strategic advantage to using issues to activate or prime voters' policy attitudes?

If priming is a useful way to understand Kennedy's 1960 strategy, his campaign should exhibit behavior consistent with two theoretical expectations. First, to cut down on uncertainty concerning voters' positions on policy issues, the candidate should respond to reported polling data indicating which particular policy issues were highly salient and accessible. In other words, the specific policy areas and policy directions that Kennedy advocated should correspond with polling information regarding what most concerned Americans. Kennedy is expected to follow public opinion by making tactical adjustments both on which specific issues to support (out of a large pool of acceptable choices) and on the frequency and strength of his statements promoting a particular issue. This theoretical expectation contradicts the conventional wisdom that the importance of the public's policy preferences (as conceptualized in spatial terms) is severely mitigated by the multidimensionality of the issue space, the uncertainty surrounding the interpretation of public preferences, and the pressure of party activists.

Second, if Kennedy's position taking did respond to reported opinion, we would expect archival and interview evidence to indicate that his stances were not premised on winning over (in straightforward fashion) the Downsian utility-maximizing voter. Rather, the campaign's positions should have been developed to selectively prime voters in order to influence the electorate's standards for evaluating and judging competing office seekers. We would anticipate that the Kennedy campaign used salient, accessible issues in order to construct an appealing image of the candidate as competent and caring, an image that diverged quite noticeably (and favorably) from that of his opponent.

METHODS AND MEASURES

Our analysis of Kennedy's campaign behavior in 1960 is based on primary evidence drawn from archival records and interviews, as well as on a combination of interpretive and quantitative analysis. Typically, campaign analysis has relied either on inferences regarding statistical relationships between candidate behavior and public opinion or on formal theoretical models in order to speculate about expected strategies. However, questions concerning how and why real politicians use and are influenced by polling results have been neglected.

To incorporate the political motivations and calculations of individual office seekers, we analyze the Kennedy campaign's archival records, along with interviews with key participants. These sources provide intensive, in-depth evidence to explore, through a few specific policies such as health care reform, the extent to which polling results cause a campaign to advocate specific policies. Moreover, archival evidence and interviews provide the basis for investigat-

ing the focus of our second theoretical expectation, namely, the campaign's strategic intentions and calculations for using opinion polls.

We supplement this interpretive study of archival records and interviews with quantitative analysis of the relationship between public opinion and Kennedy's policy positions. In particular, quantitative analysis enables us to investigate further the extent of Kennedy's responsiveness to reported public opinion.

For the statistical analysis, we collected data on public opinion and Kennedy's policy positions. Our public opinion data are new and better than those used in previous studies of candidate behavior. Past research on the public's impact on candidate behavior has relied on polling results that were published and widely circulated (e.g., Page 1978; Young 1991). The critical assumption has been that the published survey results found their way into the campaign's decision-making process (or at least reflected comparable information that was used by the campaign).

The question whether relying on published surveys is fully appropriate has been generally downplayed, given the common problem of identifying available opinion data. Clearly, however, polling results assembled and actually used by a candidate are precisely what is required for analyzing how far candidate decisions were influenced by public opinion. As far as we know, ours is the first to study systematically campaign data assembled by and for a major presidential candidate. In particular, Harris was an "integral part" of the campaign organization and regularly reported his polling results to Kennedy through both written accounts and frequent meetings with the candidate. ¹⁰

Specifically, we use the policy goals that the public cited as important in Louis Harris's surveys for the Kennedy campaign; both campaign documents and our interview with Harris indicate that this body of data had "great importance" in the campaign. Harris's polls were based on personal interviews with large representative samples in separate states. Many of the states were polled on multiple occasions. According to records in the Kennedy Presidential Library, Harris conducted 66 polls during the primary and general election campaign, 26 of them between September and November 1960. Our analysis of Kennedy's campaign against Nixon focuses on the 26 opinion surveys conducted during the general election. Rather than being evenly distributed, these polls were bunched into six weeks: they were completed during the first half of September, the second week of October, and the contest's final weeks.

We studied Kennedy's most consistent source of data on public opinion toward policy issues, namely, Harris's "most important problem" question. These data have two important characteristics: (1) they measures the salience of an issue, telling us how a particular policy area (e.g., Social Security) was ranked compared to other issues; (2) because Harris structured his surveys to ask respondents, "What do you think can be done about [a national problem]," his polls also tracked the public's preferred policy

direction (e.g., increasing Social Security payments). 11 (Racial integration offers another illustration of how issues were defined by Harris: he reported "prointegration" as one issue and "anti-integration" as a separate issue.) The unique feature of Harris's "most important problem" question, as compared to the typical salience measures, is that it reports directionality. Harris's data include respondents' judgments about direction and salience. These polling results are well suited for our study of candidate priming precisely because they identify the specific issues and policy directions that were salient and accessible to voters.

Using Harris's polling reports to Kennedy, we constructed weekly opinion measures by averaging each state's poll results for weekly intervals. For instance, for the five separate state surveys that Harris conducted during the week of 23 October, we averaged the percentage of respondents who ranked increasing Social Security as an important problem.¹²

Data on Kennedy's position taking were obtained by content-analyzing two sources of Kennedy's publicly stated positions. One source of Kennedy's statements was the four debates with Vice President Nixon.¹³ We treated each debate as a discrete event (i.e., we analyzed four distinct sets of policy statements). The debates seem to warrant this separate attention because of the importance that Kennedy (and history) attached to these first televised exchanges between presidential candidates. Moreover, polling results were, according to Harris and others, an important consideration in briefing Kennedy and plotting the campaign's strategy toward the debates. 14 The debates, however, are not a direct measure of Kennedy's strategic position taking: because journalists asked the questions and therefore controlled the agenda, the debates are at best an indirect, mediated avenue for activating voters' attitude struc-

A better and more direct indicator of Kennedy's statements is contained in a comprehensive collection of the candidates' day-to-day speeches and other statements, which was compiled by the U.S. Senate. ¹⁵ The Senate studies offer a record of the public statements of both candidates during the entire general election campaign.

Kennedy's policy stances in the debates and in his other public statements during the entire campaign were coded on a five-point scale from explicitly supportive (+2) to explicitly opposed (-2), with the midpoint (0) representing a neutral or unclear position (+1 and -1 indicate probable support and opposition, respectively). We then summed these results to produce weekly measures for the content of Kennedy's statements on an issue. 17

Our data, then, consist of 55 separate policy issues that were cited in Harris's poll reports and in Kennedy's public policy statements during the entire campaign, each issue being defined in a directional sense (e.g., increasing Social Security).¹⁸ Because we collected data on 55 separate issues, we are able to conduct separate analyses of specific issues and pol-

icy directions. Our analysis is not confined to studying such broad policy categories as "social welfare" or foreign policy.

For each of the 55 issues, we created weekly measures of Kennedy's reported opinion poll results and his policy statements (as recorded by the Senate study) for each of the 10 weeks between 1 September and 8 November. The number of cases, then, is the sum total of both policy stances on, and polling data for, each of the 55 issues during the 10 weeks of the campaign, the maximum number being 550. Because Harris's opinion surveys were clustered during six weeks, however, the effective number of "issueweek" cases falls below this total. Technically, then, we have 55 (abbreviated) pooled time series, making it possible to compare many issues and time periods.

We created the weekly measures in order to reflect the campaign's operations and use of Harris's surveys. When it came to incorporating polling results, the campaign did not view each day as a discrete unit. Instead, Harris's surveys were conducted in clusters and the campaign drew on these blocks of results until the next batch was forwarded. Weekly aggregation of the opinion and policy data approximates this process of bundling together intermittent polling results in order to evaluate campaign strategy.

F

Our concern to capture the campaign's operations also led us to use time lags in analyzing the debates and the candidate's public statements (as compiled by the Senate). We dated Harris's results according to the completion of the surveys. Obviously, it took significant time both for Harris to enter and analyze the survey results and for the campaign to consider altering the candidate's speeches and other statements. According to campaign documents, Harris's data on the public's policy goals took on average two weeks to reach Kennedy for much of the campaign. For instance, we related Harris's results during the campaign's first week to Kennedy's public statements during the third week of September. For the campaign's closing week, however, the evidence suggests that a one-week lag is more appropriate: Harris shortened the report time as the urgency and demand for results increased. 19 (Indeed, more than a quarter of Harris's polls were completed with less than two weeks remaining in the campaign; these results were obviously used in much less than 14 days, and the last polls within a week.) The substantive reasons for using two-week lags during the campaign's first six weeks and one-week lags during its final four weeks is supported by our results; we examined a variety of lag structures and the proposed lag structure produced the clearest and strongest pattern of results.20

ISSUES, CANDIDATE IMAGE, AND CAMPAIGN STRATEGY

Interviews and archival records suggest that the Kennedy campaign analyzed the candidate's policy

positions and the public's perception of his personal image as interconnected (rather than mutually exclusive) strategic concerns. Indeed, soon after the 1956 election, Kennedy was wondering, "What am I going to be for?" By the time the campaign gathered steam in 1959, his clear identification with a few policy positions (that were acceptable to the candidate) was seen as a way to adjust "the so-called Kennedy image."21 Throughout the primary and general election campaigns, Kennedy's aides carefully tracked their candidate's image and attempted to pinpoint his perceived personal characteristics that were considered unfavorable. (Harris devoted a separate section of his surveys to tracking and analyzing the public's image of Kennedy's personality and his job performance.) Thus, when aides identified public perceptions of Kennedy as "too slick" and "lack[ing] depth," they repeatedly recommended that the campaign develop a "Kennedy-identified program" that would appeal to two distinct groups of voters: ideologically oriented party activists and more moderate centrist voters.

In response to criticism from the left wing of the Democratic party, an aide urged Kennedy in 1959 to address in "clear and unmistakable terms" the "prevailing doubt... that Kennedy is a bonafide liberal." The campaign, he proposed, needed to develop an image of Kennedy that would "enable people to be for something [and someone] that excites their imagination." Similar anxieties about Kennedy's image emerged immediately following the presidential conventions, with aides agreeing that the campaign had reached its "low point." In response, Schlesinger suggested that "the present lethargy of the campaign" be reversed by "giv[ing] the enthusiasts something to believe in": "Once the issue-minded Democrats catch fire, then the campaign will gather steam." Kennedy's issue positions, then, were understood by campaign officials as a mechanism, at least in part, to charge the party faithful with "crusading urgency."

But campaign officials sought to identify a "package" of issues that both appealed to party activists and responded to the concerns of the centrist voter. They expected that party activists would support (rather than resist) popular positions. Thus campaign officials decided to fashion a "move-ahead" image for Kennedy that would demonstrate a large difference between the Republican and Democratic candidates. The objective, in particular, was to identify Kennedy with new and dynamic approaches to the country's problems, while tying Nixon to eight years of Republican "do-nothingism." Campaign officials calculated that emphasizing Kennedy's proposals for addressing several highly salient issues, which were accessible to the average voter, would serve as a "campaign tool" for creating an appealing image. Thus, in the final phase of the campaign, Harris pressed Kennedy to "go on the offensive" to press his "basic theme on all the issues: to get America on the move at home and abroad."²⁴

While an overarching, "move-ahead" image for

Kennedy could reasonably be expected to appeal to reform-oriented party activists, it was the perceptions of the centrist (or median) voter that primarily concerned the campaign. Two criteria, then, were especially critical in the campaign's decisions: (1) identifying issues that were highly salient and accessible to the public and (2) using the activation of voters' attitude structures regarding these issues to demonstrate large differences between the candidates. The first criteria involved responding to public opinion, the second, directing or manipulating voters' evaluations of Kennedy's personal character.

CAMPAIGN RESPONSIVENESS TO PUBLIC OPINION

Our quantitative analysis confirms that Kennedy's positions responded to public opinion: the issues that were raised in Louis Harris's polls were persistently mentioned by Kennedy in his subsequent public statements. What is significant is not just that Kennedy cited issues identified by the public but that the frequency and strength of his stance was congruent or consistent with the public's preferred direction for policy.

The following types of issues, which were salient to respondents in Harris's surveys, were also publicly advocated by Kennedy in the debates and in his public statements (as compiled by the Senate): increasing Social Security, passing Medicare legislation, reforming education, fighting unemployment, combating the high cost of living, and such foreign policy issues as bolstering America's military spending and

general prestige.

The relationship between the policy goals that Harris's respondents consistently identified and the candidate's (subsequent and congruent) positions was most clearly evident in Kennedy's public statements. The last row of Table 1 reports overall results. When we compared Harris's weekly polling results (allowing for the appropriate one- or two-week lag) with Kennedy's subsequent positions, we found that Kennedy took congruent positions on 56% of the issues cited in the polls, compared with 27% of the issues not cited in the polls—a 29% difference.

The regression results in Table 2 confirm these findings. The last line of the table indicates that the average correlation (r) between the percentage of public support for a policy goal each week and the position Kennedy staked out was .38. The slope coefficient (b) of .42 for the regression of candidate position on public opinion indicates that for each 2% or so of the public citing a particular policy during a given week, there was one additional congruent policy statement (coded 1 in our content analysis) during the subsequent weekly interval.

These overall findings, however, mask critical variations over the course of the campaign. The strongest relationships are especially evident during the first week in October and the closing weeks of the contest.

average (29%). Fully 78% of the issue positions cited in Harris's surveys two weeks earlier were echoed by Kennedy during the campaign's fifth week, compared to 41% of the issues that did not appear in the polling reports. Similarly, the regression coefficient rose to .40 (r = .30) from previous week's figure of .08 (r = .15).

The most striking results occurred during the closing weeks of the campaign. Table 1 suggests that week 10 produced a 36-point percentage difference, 9 points higher than the previous week. Table 2 confirms this overall picture of heightened responsiveness during the campaign's home stretch. In particular, the b coefficient for the campaign's ninth week was .78, nearly twice the size of the average figure (.42). It was also larger than the figure (.55) for the previous week with available data—week 7. For each 5% of the public citing a particular policy during the campaign's eighth week, there were two additional directly congruent policy statements (coded 2 in our content analysis) during the following week. Kennedy's elevated responsiveness is illustrated by his handling of unemployment during campaign's home stretch: a threefold increase in Harris's polling results during the second week in October (from 4% to 13%) was associated with a fourfold increase in Kennedy's statements the following week (from a policy statement score of 6 to a score of 26).

L

Tables 1 and 2 present an interesting contrast for week 9: the percentage difference is average, whereas the b coefficient is the largest of any week. Although Kennedy was not more apt than on average to raise an issue that the public cited, the results that Harris reported to Kennedy apparently had an exceptional impact on the number and strength of his statements: Kennedy was acutely responsive to the issues that were highly salient and accessible.

Kennedy's heightened responsiveness during the campaign's final weeks is consistent with the strategic importance of this period for priming voters. The attitudes structures that have been most recently activated from the electorate's short-term memory will be especially decisive in voters' choices. Indeed, it was during the campaign's final push that Harris pressed Kennedy to "go on the offensive" by advocating salient issues.²⁵

The statistical results for Kennedy's positions during the two debates for which there were preceding opinion surveys are also revealing. The last row of Table 3 shows that in the debates Kennedy was, on average, 41% more likely to promote issues that were cited in previous polls than to raise issues that lacked public attention and support: he made congruent statements on 49% of the positions cited in Harris's reports compared to 8% for issues not cited in the polls. The last row of Table 4 presents the average regression results: the b coefficient is .18, and the correlation coefficient is .47. Overall, then, an issue's citation in Harris's reports made it quite likely that Kennedy would raise the issue, but the impact of reported opinion on the strength and frequency of

Kennedy's statements, as estimated by the regression b coefficient, was not strong.

Kennedy's was most responsive during the first debate, which occurred on 26 September. Table 4 indicates that the b coefficient for the first debate was more than twice that for the other debate (.26 vs. .11). Moreover, the 45% difference in Table 3 is the highest figure to emerge in our analysis: Kennedy made congruent statements during the debates on 56% of the issues cited in Harris's reports, compared to 11% on issues not cited in the polls.

The strong findings for the first debate may reflect a general *trend* toward responsiveness during this period. The results for Kennedy's public statements,

which are presented in Tables 1 and 2, also found that public opinion became more influential during and after the debate (compare weeks 4 and 5 in Tables 1 and 2). However, the statistical results for the debates should not be overstated: analysis of the first debate is limited to a relatively few statements during a short period—one evening. In addition, reported opinion had only moderate impact at best on the frequency or strength of Kennedy's statements. The media's role may explain why reported opinion had a more limited impact on the debates than on Kennedy's public statements: because journalists asked the questions, they (not Kennedy) controlled the agenda and the set of issues that the candidates addressed. Kennedy's reduced responsiveness during the debates may reflect the media's intervention.

The general pattern of our findings suggests a striking and consistent relationship between Harris's surveys identifying a policy issue as important and Kennedy taking a subsequent and corresponding position on it in his public statements and in the debates.

Kennedy, however, did take positions on such issues as civil rights and foreign aid that the public either failed to fully support or openly opposed. On the issue of civil rights, Harris reported responses to the following three related issues: antiintegration, prointegration, and states' rights. These three issues were identified in nearly each of the 26 surveys conducted.

Public opinion toward civil rights clearly divided on regional grounds. Respondents in critical north-eastern states like New York and Pennsylvania consistently ranked prointegration among their top 10 concerns; segregationist positions (opposing integration and favoring states' rights) were not identified as major concerns. States in the Democrats' traditional stronghold of the South held nearly opposite preferences: states like South and North Carolina identified antiintegration as their top policy concern.

Kennedy cautiously reacted to these regional divisions in public opinion (and in the Democratic party). On the one hand, he spoke in favor of expanded civil rights, a position that went against the antiintegration attitudes in the South. On the other hand, he had sufficient information about southern opinion to appreciate the benefit of crafting an ambiguous position and minimizing the issue's exposure during the campaign. Thus, when the issue was raised, Kennedy emphasized his narrow, legalistic concerns and endorsed civil rights based on constitutional (rather than moral) grounds. Kennedy did his best, though, to downplay the issue and its salience: over the course of three months of continuous daily statements, he only made statements on the issue a couple dozen times. One of the only wrinkles in the campaign's avoidance of the potent issue of race was caused by Kennedy's call to Coretta Scott King on the eve of the election. Robert Kennedy's initial reaction was that contacting King had "lost" or "screwed the whole election up." He feared that the call had attracted attention to the issue of civil rights as one of the standards on which the candidates would be judged (according to Sargent Shriver, quoted in Jackson and Riddlesperger 1991, 5). In other words, the fear was that the candidate's action had activated voters' memories about a set of issues that could only hurt their evaluation of John Kennedy: his understated position would satisfy neither southerners nor integrationists.

Too much foreign aid was another position with which Kennedy did not publicly agree or follow public opinion: this position was persistently cited by a relatively high proportion of Harris's survey respondents, but Kennedy repeatedly staked out an opposing position in the debates and in his public statements. As Harris emphasized in our interview with him, foreign aid was an area about which Kennedy deliberately "took a stand in spite of public opinion" in order to assure other elites of his worthiness to be president. Instead of deferring to public opinion, he devoted an exceptional amount of time (especially during the October debates) attempting to educate the American public about a foreign policy that advanced the country's national interests.²⁶

Issues like foreign aid and civil rights, however, are clearly exceptions. In general, Kennedy was much more likely to take stances on issues that Harris identified as salient and popular than on policies that lacked this kind of support.

Archival records of Kennedy's primary and general election campaigns corroborate the statistical evidence that the campaign consistently selected issue areas and particular policy directions that were salient and accessible to Americans. The issue of passing Medicare legislation, which would help finance the elderly's health care, illustrates this sensitivity to public opinion (Jacobs 1993, 1992a).

The tireless reformer, Wilbur Cohen, deliberately capitalized on the campaign's concern with public opinion when he pressed Kennedy to promote Medicare: Cohen assembled recent polls in order to be able to tell "Kennedy and his people: this proves . . . we've got public opinion." Moreover, Harris also stressed that he found strong polling results favoring Kennedy's medical care position: he repeatedly identified it as among "the most dominant overall-all problem[s] of concern to voters and the sharpest cutting edge[s]" between the candidates. In his polling reports and verbal advise to Kennedy, he concluded that "there is no situation, no local or national speech, in which the medical care issue should be ignored." 28

Kennedy's recognition of this "public interest and apparent support" prompted him to select Medicare for particular emphasis. As one campaign official recalled, Kennedy believed that it was, "of all the issues on which he campaigned, . . . the one that constantly provoked the most interest." Kennedy's perception of Medicare's salience (one shared by other campaign officials) prompted him to select it from a "roster" of issues that he already supported for particularly frequent and strong statements.²⁹ Indeed, a careful look at Harris's findings and Ken-

nedy's statements suggests a close relationship. For instance, a more than twofold increase in public support for Medicare during mid-September (from 9% to 22%) coincided—two weeks later—with both a sevenfold increase in Kennedy's daily attention to the issue (from a policy statement score of 2 to a score of 14) and a decision to select Medicare for exceptionally frequent, strong, and extensive statements during the first debate. In short, Kennedy's polling information prompted him to make tactical adjustments, modifying the extensiveness and forcefulness of his positions.

USING SALIENT POSITIONS TO BUILD CANDIDATE IMAGE

Evidence of Kennedy's responsiveness—that he consistently took positions on specific policy areas and options that were salient and accessible to Americans—suggests that information about public opinion from his private polls was strategically attractive to the candidate because it diminished his uncertainty regarding voter preferences (Geer 1991). The responsiveness to the public's concerns about policy issues contradicts the conventional assumption in campaign analysis that rational candidates avoid position taking. What remains unanswered, however, is how Kennedy's information regarding the public's policy concerns was understood and used in strategic terms by the campaign. Conceivably, Kennedy's responsiveness could have been motivated by Downsiantype calculations: he may have positioned his issue stands in close proximity to the public's policy concerns, expecting voters to make a prospective decision that his election would secure desired benefits. Alternatively, the campaign's calculations may have implicitly reflected a strategy of priming. That is, the strategic objective of adopting positions on popular issues may be to emphasize standards for evaluating a candidate's personal characteristics, which encourages voters to perceive large-and advantageousdifferences in the candidates' images.

The Kennedy campaign viewed position taking on salient, accessible issues as the means by which to project the candidate's "move-ahead" image. 30 It was "through the issues" and by "hammer[ing] home" his positions on medical care, education, and other policies that the campaign attempted starkly to contrast Kennedy's image (as "caring" and willing to offer new approaches) with Nixon's identification with the Republican's "drift and inaction." "The most fundamental job," Harris advised, was to "increase Kennedy's identification . . . with the problems important to voters" and thereby to demonstrate that Kennedy, unlike Nixon, "really cares" about addressing the problems facing the country and individual voters. Thus, although medical care was expected to have special meaning for liberals and the aged, the medical care issue was also seen as a

way to shape Kennedy's image to "many voters other than the old people themselves." ³³

The Kennedy campaign's decision to use popular policy issues as part of a priming strategy raised two strategic concerns. First, the campaign struggled to identify Kennedy visibly with these popular issues. It used a range of strategies (including Senate activities³⁴ and a "TV spot campaign")³⁵ to cement Kennedy's identification with popular issues. For example, in preparation for the debates, Kennedy's advisers analyzed the most effective issues, with Harris identifying "leading domestic issues as they emerge from our surveys" (medical care and education topped his list). As part of this effort to make sure that Kennedy impressed voters with his concern about salient issues, the campaign monitored whether and with what frequency Kennedy discussed these issues during the debates.³⁶

Second, as the general election campaign developed, Kennedy's advisers endeavored to protect Kennedy's identification with popular issues from Nixon's efforts to (as Clark Clifford put it) "fuzz up" the differences.³⁷ For example, Nixon's concern with the Democrats' use of the popular Medicare issue led him to reverse the Eisenhower administration's previous opposition to new legislation and to "resort to me-tooism." Nixon stressed that despite the differences in the approaches favored by the candidates, he shared Kennedy's aim of helping the aged finance their health care (David 1985; Jacobs 1993, chap. 5; Page 1978, 73–74).

In other words, Nixon was attempting to counter Kennedy's strategy of priming salient issues in order to portray large differences in each candidate's character. The Republicans intended to neutralize the impression that Medicare illustrated Nixon's listless character as opposed to Kennedy's forward-looking approach. Nixon's actions are consistent with theoretical models about rational candidate behavior: he used information following Kennedy's announcement to better estimate the true position of voters and decided to modify his position accordingly.³⁸

Alarmed at Nixon's attempt to create the "illusion" of similarity between the candidates' positions, Kennedy's aides repeatedly urged their candidate to emphasize the differences on the issues. ³⁹ If popular issues were to be an effective "tool" in shaping public evaluations, the campaign felt compelled to protect and reinforce Kennedy's identification with those issues. Thus, as election day approached, Harris frequently warned Kennedy to resist Nixon's "fuzzup" effort and his own campaign's tendency to "move over to new issues" by "dramatizing" and "pressing home" the candidates' differences. ⁴⁰

DISCUSSION

We modified social psychologists' study of priming by shifting its focus from individuals to candidate behavior and by accounting for the tactical considerations and intentional strategies of modern campaigns. Partly because position taking risks alienating centrist voters, candidate priming is expected to respond to salient and accessible issues: campaigns emphasize these issues in order to influence voters' evaluations of their candidate's personal image and to demonstrate large appealing differences from their competitors.

Our analysis of Kennedy's strategy in the 1960 race confirms two critical aspects of a candidate priming strategy. First, we found that Kennedy responded to private polling information that identified specific policy areas and policy directions that were highly salient and accessible to Americans. Statistical evidence concerning the impact of reported opinion was reinforced by interviews and archival evidence. In its efforts to fashion a winnable election strategy, the Kennedy campaign used its polling results to select and emphasize a limited number of policy issues from a large pool of possible choices.

Some of Kennedy's positions (e.g., his support for health insurance for the aged) were enduring "party cleavage" issues, over which Democrats had been battling Republicans for decades. It could naturally be anticipated that the relationship between Kennedy's positions and Harris's polling results was spurious: it is possible that the candidate's positions were driven not by polls but by longstanding divisions between the political parties and their supporters. In other words, party activists (rather than the electorate) may have been the driving force.

Although partisan cleavages obviously played a role in the 1960 elections, the archival and statistical evidence strongly suggests a causal connection between Kennedy's polls and the positions he took. While partisan division might explain why various issues would be included in the pool of conceivable election issues, the evidence indicates that Kennedy's campaign was quite selective regarding which policies it chose from this pool of party cleavage issues. Moreover, some of Kennedy's positions (such as his foreign policy stance on the new issue of rebuilding American prestige) were not issues that had persistently divided the parties.

Kennedy's concern with responsiveness to public opinion was also reflected in his decision to commit scarce financial and organizational resources to polling and to incorporating these assessments of public opinion into the campaign's decisions. Indeed, the campaign's organizational and strategic interest in assembling private poll data was a watershed event in the evolution of modern campaigning. It is well known that past politicians conducted polls; but the number, quality, and strategic use of Harris's surveys represent significant innovations. Indeed, Kennedy and his aides believed that their recognition of the "importance and value [of polling results] on the American scene" and on the designing of campaign strategy were historic firsts. 42 The campaign's pioneering use of polling to improve its information about voters' concerns had an effect beyond the 1960 race: the campaign prompted Kennedy to inaugurate

private polling as an enduring, institutional commitment of the White House (Jacobs 1992b; 1993). 43

Our second finding is that Kennedy's responsiveness coexisted with his attempt to manipulate voters' evaluations of his personal character. Kennedy's responsiveness to the issues that the public ranked as important was driven neither by an exclusively image-based strategy nor by a straightforward Downsian calculation that the proximity of his issue stances to voter's preferences would win over the electorate. (Of course, Kennedy's campaign did not use or consciously test these competing theories.) Instead, the campaign viewed Kennedy's advocacy of a few popular policy issues as a political resource for highlighting the candidate's bold, competent proposals for "moving ahead." By emphasizing a few salient, accessible issues in voters' memories, the campaign intended to shape the electorate's standards for evaluating and judging competing office seekers. The objective was to use priming to construct an image that would be appealing and noticeably divergent from Nixon's.

Although comparable research on other presidential elections has not been conducted, Kennedy's use of salient issues to shape candidate image may provide insights into subsequent campaigns—even those in which candidate behavior apparently followed Downsian expectations. For instance, the 1964 and 1972 presidential contests appear to be classic illustrations of candidates offering divergent policy stands. Goldwater and McGovern presumably lost because their opponent's centrist positions promised greater benefits to the median voter than did their own extreme proposals. Nevertheless, further analysis of each candidate's issue stands may well find the voters' decisions in 1964 and 1972 resulted from the victorious candidate's use of a priming strategy. By focusing the electorate's attention on Goldwater's and McGovern's initial, isolated, and often retracted "extreme" issue stances, the eventual victor in each race was able to mobilize (with the media's assistance) widely shared beliefs that cast their opponents in a bad light (Kelley 1983; Page 1978; Popkin 1991).44

CONCLUSION

Our findings have two broad implications for the future study of elections. A fuller assessment of these implications than is possible here, however, requires that our empirical analysis of one campaign be supplemented with research on additional campaigns and on voting behavior. First, the process of priming may provide an analytic basis for recoupling research in the two subfields of voters' motivation and campaign strategy. For decades, the two interrelated components of electoral analysis—research on voters and on candidates—were held together by a shared emphasis on the influence of candidates' personal image and on the limited role played by policy issues. The limits on Downsian expectations regarding issue-oriented campaigns were compounded by a number

of stable obstacles to issue-guided vote choice: voters' incomplete or inaccurate information, their tendency to make retrospective judgments of government performance, and their party loyalties (Campbell et al. 1960; Fiorina 1981; Keith et al. 1992; Smith 1989).

The conventional wisdom, however, that rational campaigns adopt nonissue strategies that emphasize favorable personal images has been undermined by the recent revisionist interpretation of the American electorate (e.g., Aldrich, Sullivan, Borgida 1989; Popkin 1991; on policy preferences more generally, see Page and Shapiro 1992). The finding that voters are influenced (perhaps decisively) by policy issues has effectively decoupled current analysis of voters from the study of campaigns; voting studies consider issues quite consequential for voters, whereas the analysis of campaigns treats candidate strategy and behavior as non-issue oriented.

If analysis of campaigns is to be reintegrated with the study of voting, new approaches that recognize policy issues as an important basis for vote choice must be developed for investigating candidate behavior. Research on priming offers one approach for conceptually linking the analyses of campaign behavior and vote choice. Incorporating candidate behavior in the study of voters would mean treating the influences on vote choices as endogenous to the campaign (i.e., the impact of deliberate strategies that candidates pursue in order to win over voters). On the campaign side, priming is useful for refocusing campaign analysis on candidates' treatment of issues. Kennedy's 1960 candidacy illustrates how one campaign combined image building with a candidate's position taking on issues that responded to perceived public opinion.

Second, the Kennedy campaign's collection and use of polling information raises complex normative issues that defy simple categorization. On the one hand, the campaign's sophisticated use of opinion surveys might be considered consistent with a conception of liberal democracy in which political leaders both respond to and direct public opinion. In terms of democratic responsiveness, Kennedy was systematically guided by polling on voters' concerns. Moreover, liberal democracy is also premised on politicians directing or educating the mass public on critical issues of national importance. Kennedy's determined efforts to move public opinion toward embracing his position of backing foreign aid suggest that on this issue, he did alter the balance between leading and following public opinion. In addition, Kennedy's success in using a strategy of this sort may confirm the role of competitive elections in leadership selection. The Democrat's victory could be interpreted as foreshadowing his effectiveness as a national leader.

On the other hand, Kennedy's campaign strategy does have a disturbing implication for integrating elections into the governing process of America's liberal democracy. 45 In an ideal situation, competing candidates would respond to public opinion (and to pressure from party activists) by offering important and constructive policy positions. Voters' choices in the electoral process could then identify clear directions for subsequent government decisions. In effect, this style of competitive elections would fulfill the long-denied objectives of responsible party advocates: elections would not only serve as formal processes for determining succession but would be linked to choices over basic policy direction (Lowi 1967, 1985; Schattschneider 1948).

Kennedy's 1960 campaign devoted enormous resources to identifying the public's policy goals, but this information was used to influence evaluations of Kennedy's personal qualities. For responsible party advocates, then, the recoupling of voters and campaign strategy in this way is not promising: candidates incorporate issues into their strategy but they do not bank on substantive (and popular) policy positions to win their contests. Kennedy's selective use of issues meant that no clear meaning could be attached to his electoral victory; there was no mandate or popular confirmation of a policy platform to pursue in governing once he took office.

The emergence of this form of priming is consistent with a political regime that has often failed over much of the last two centuries to incorporate policy decisions into the electoral process (see Ginsberg 1972, 1976; Lowi 1967, 1985). Candidates' efforts to prime voters in order to manipulate their evaluations is but one more reason that Americans' choices of officeholders rarely settle policy issues.

Notes

We would like to acknowledge the able assistance of Scott Adler, Scott Allard, Angela Hernandez, Sandy Johnstone, Paul Kramer, Harpreet Mahajan, Sara Offenhartz, Edward Rodriguez, and Eli Schulman. Kelly Patterson generously shared data. Julie Schumacher provided her usual goodnatured assistance. Special thanks are owed to Mary DeFlorio and the rescue mission of Bob's mother-in-law, Bernice De-Florio. The staff at the John F. Kennedy Library provided archival assistance, and the Center for the Social Sciences (Columbia University) offered research assistance. Charles Cameron, Michael Delli Carpini, George Edwards III, William Flanigan, John G. Geer, Benjamin Page, Richard Pious, Steven Smith, James Stimson, and John Sullivan offered valuable comments. This project has also benefited from research grants from the University of Minnesota Graduate School, the University of Minnesota Land Grant-McKnight Professorship, the John F. Kennedy Foundation, and the National Science Foundation (SES-9122440)

1. Analysis of strategic position taking differs from Downs's own work in several critical respects. In contrast to what is often considered Downsian analysis, Downs himself emphasized the role of nonissue considerations (1957, esp. pt. 2) and, moreover, focused on the behavior of political parties,

rather than individual candidates.

2. It is not necessary to pinpoint the process by which attitudes become accessible—whether retrieved via chronic or temporary accessibility. It is reasonable to assume that even if attitudes are chronically accessible, the retrieval of such attitudes is enhanced by campaign priming (Aldrich, Sullivan, and Borgida 1989).

3. While we focus on candidate priming strategies, we recognize that voters face multiple sources of priming.

4. In fact, spatial models have taken this into account

mathematically by including a set of weights, which accounts for the relative importance of issues (e.g., the "a-matrix"; see Davis, Hinich, and Ordeshook 1970). One complication, however, is that different issues may be important to different individuals: the weights theoretically can vary across individuals. In addition—and most important—the weights are variables. They are not given.

5. The simulation project's input into the Kennedy campaign was largely limited to the period before the general election campaign. But, Pool, Abelson, and Popkin concede that their studies were not viewed as useful by Kennedy's aides, who relied on Louis Harris's studies (1964, 18)

6. We generally focus on responses to the following type of open-ended question: "Now, what do you feel are the two or three biggest problems facing people like yourself that you feel the national government should do something about in the next four years? Any others?" As we shall discuss, Harris reported not only the ranking of a policy's importance but also the policy direction that respondents preferred.

7. Harris to JFK, 23 July 1959, box 24, JFK Theodore Sorensen Papers, Kennedy Library; Harris to JFK, memo, 5 July 1960, box 39, Political, Pre-Administration, JFK/RFK Papers,

Kennedy Library.

- 8. JFK to Harris, memo, 5 July 1960, box 39, Political, Pre-Administration, RFK Papers, Kennedy Library; interview with Harris by authors, 17 June 1991.
 - 9. Interview with Harris by authors, 17 June 1991.
 - 10. Ibid.
 - 11. Ibid.
- 12. Archival records and our interview with Harris suggest that Kennedy treated the state public opinion data as representative of national opinion. It is on this basis that we compare the responses of Harris's state samples with Kennedy's policy statements.
- 13. The debates occurred on 26 September, and 7, 13, and 21 October, with the first focusing on domestic policy and the last on foreign policy (the subjects of the other two debates
- 14. Interview with Harris by authors, 17 June 1991; interview with Helen Lempart by N. Aldrich, March 1966, Kennedy Library; "Memorandum on the First Kennedy-Nixon Debate on Domestic Issues 22 September 1960, box 36" Political, Pre-Administration, JFK/RFK Papers; "Index to topics discussed and list of topics not discussed by Senator

Kennedy during the first four debates."

- 15. A subcommittee of the Senate Commerce Committee assembled a four-volume set of the public positions taken by Kennedy and Nixon as part of its investigation into the dissemination of political information during the 1960 general election campaign. We coded what were clearly Kennedy's main substantive policy statements in part 1 (speeches, remarks, press conferences, and statements) and part 3 (radio and television appearances) (United States, Congress, Senate 1961). Further information is available from the authors.
- 16. We prepared detailed written instructions and held frequent discussions with two graduate research assistants concerning coding rules and treatment of problematic cases. We independently coded random samples of Kennedy's statements and the content of the debates to verify that the instructions were followed. Coding discrepancies of more than one unit of our five-point scale occurred on approximately 5% of the assistants' and authors' coding. Finally, the coders were unaware of the polling results and therefore were unaffected by prior knowledge concerning our opinion mea-
- 17. For instance, if Kennedy took 3 positions within one week on the issue of civil rights and these statements were coded +2, -2, and +1, the weekly measure for the content would be +1.
- 18. Any issues omitted from the debates, the Senate material on daily statements, and Harris's polls (and thus excluded from our data) would have led to underestimates of the correlation between the poll reports and Kennedy's visible positions. Moreover, on opposing Communist China and issues related to Catholicism, Kennedy actually had addi-

tional opinion data that we did not incorporate in our statistical analysis. On the issue of Catholicism, Harris provided substantial evidence separate from his "important problem" series; on the issue of China, Harris reported general opposition to communism, which may have influenced Kennedy's more specific policy toward China. (We coded the candidate's position toward China as a separate issue.)

19. Harris did telephone Kennedy with preliminary results. Although horse-race reports on Kennedy's standing against Nixon could easily be conveyed verbally, the more cumbersome data on policy issues were reported last and took the longest time to incorporate into campaign strategy. Inter-

view with Harris by authors, 17 June 1991.

20. The use of one-week lags during September produced statistically insignificant results, which is consistent with the expectation that Kennedy's strategists did not receive and incorporate Harris's results until some two weeks after the survey's completion.

Aldrich, March 1966, Kennedy

37. Clark Clifford to JFK, memo, 27 September 1960, box 36, Political, Pre-Administration JFK/RFK Papers, Kennedy Library

38. The interrelationship between Kennedy's and Nixon's behavior underscores the fact that campaigns involve strategic interactions, rather than a one-player game. Neither space nor comparable data enable us to explore here this important

component of campaign strategy.

39. Interview with Clinton Anderson by John Stewart, 14 April 1967, Kennedy Library. "Memorandum on the last Nine Days of Campaigning," confidential memo, box 43, Political, Pre-Administration, JFK/RFK Papers, Kennedy Library; George Belknap, "Most Americans Are Basically 'New Deal-June-August 1960, Box 45, Political, Pre-Administration, JFK/RFK Papers, Kennedy Library; Abraham Ribicoff to RFK, 15 October 1960, box 25, Political, Pre-Administration, JFK/RFK Papers, Kennedy Library.

40. Louis Harris and Associates, "A Study of Presidential Election in Ohio, Wave II," 19 October 1960, box 45, Political, Pre-Administration, JFK/RFK Papers, Kennedy Library.

41. For instance, while health insurance is an obvious issue on which the political parties disagreed, Kennedy's proposal differed in important respects from the last major Democratic

plan, Truman's universal health insurance proposal.
42. JFK to George Gallup, 24 July 1959, box 24, JFK/ Theodore Sorensen Papers, Kennedy Library; Harris to JFK, 23 July 1959, box 24, JFK/Theodore Sorensen Papers, Kennedy Library; Harris to JFK, 5 July 1960, box 39, Political, Pre-Administration, JFK/RFK Papers, Kennedy Library; interview with Harris by authors, 17 June 1991.

43. Johnson significantly expanded the White House's poll-

ing operation (Jacobs and Shapiro 1992).

44. Future research may find that the campaign responsiveness to public opinion can lead to strategies that are quite different from that which Kennedy pursued. For instance, reported opinion led the 1988 Bush campaign to avoid economic issues, which were the top public concerns, and instead to focus attention on the previously quiet issues of crime and patriotism (Moore 1992).

45. Lying or misleading the public would be another serious threat to liberal democracy; evidence of this type of manipulation occurred in the case of the alleged U.S.-Soviet "missile gap" (see Key 1961; Page and Shapiro 1992, chaps. 6,

ENHANCING DEMOCRACY THROUGH LEGISLATIVE REDISTRICTING

ANDREW GELMAN University of California, Berkeley GARY KING Harvard University

The demonstrate the surprising benefits of legislative redistricting (including partisan gerrymandering) for American representative democracy. In so doing, our analysis resolves two long-standing controversies in American politics. First, whereas some scholars believe that redistricting reduces electoral responsiveness by protecting incumbents, others, that the relationship is spurious, we demonstrate that both sides are wrong: redistricting increases responsiveness. Second, while some researchers believe that gerrymandering dramatically increases partisan bias and others deny this effect, we show both sides are in a sense correct. Gerrymandering biases electoral systems in favor of the party that controls the redistricting as compared to what would have happened if the other party controlled it, but any type of redistricting reduces partisan bias as compared to an electoral system without redistricting. Incorrect conclusions in both literatures resulted from misjudging the enormous uncertainties present during redistricting periods, making simplified assumptions about the redistricters' goals, and using inferior statistical methods.

'n 1982, the Michigan Supreme Court imposed a redistricting plan on their state that was generally believed to favor the Republicans. The Democrats' alternative measure had to pass the legislature with a two-thirds vote, which was difficult even though they had a majority in both houses. Democratic leaders tried to sneak through the legislation by gutting the contents, but not the title, of an irrelevant bill at the last minute and inserting redistricting legislation. The Republicans discovered this ploy, making the situation extremely tense. In the heat of the long debate during this midnight session, a Democratic senator collapsed. Paramedics were called in, but he refused to leave the Senate floor before the vote. In a classic case of political hardball, a Republican senator used parliamentary procedure to delay the vote by insisting that the legal description of all 148 legislative districts and their boundaries be read into the record. Despite his failing health, the Democratic senator stayed through the entire reading, and his party won the vote.1

During the Illinois redistricting process,

Republican state Senator Mark Rhoads believed he had the Democratic votes needed to pass a GOP map in the Senate. In a rare Sunday legislative session Rhoads became outraged over the parliamentary tactics employed by [Senator] Rock to delay a vote on reapportionment. Unable to control his anger, Rhoads attempted to charge the podium and get at Rock. However, before he reached the burly Senate president, Democratic downstate Senator Sam Vadalabene sucker-punched Rhoads with a right to the jaw. According to eyewitness Al Manning of the State Journal Register, "for a moment it looked as though both benches were going to empty," but, with the television cameras grinding, the combatants were pulled apart. Later in the day, Rock eventually called the remap bill and with total party unity the Democrats passed out their own bill, thus assuring a reapportionment deadlock. (Green 1982, 32)

These are among the most colorful recent redistricting stories, but they accurately portray the intensity of the partisan conflict in many such processes throughout the United States. From George Washington's first presidential veto to the present day, redistricting issues have been extremely controversial at every level of government. Most redistrictings are contested in state and federal court cases heard so late that there is insufficient time to follow the usual rules of discovery, evidence, or due process. In total, legislative redistricting is one of the most conflictual forms of regular politics in the United States short of violence.

While partisan and bipartisan redistricting plans can protect incumbents, they only protect some of those who survive the redistricting process—and many do not survive. Indeed, most incumbent politicians would give an awful lot to avoid redistricting altogether. After all, they are fighting over the fundamental rules of the game (fights that might well have been concluded at the founding of the republic) and for their own political survival. As a result, redistricting creates enormous levels of uncertainty, an extremely undesirable situation for any sitting politician. Indeed, because the costs of the political fight frequently outweigh the benefits of government service during redistricting, incumbents disproportionately choose to retire at this time.²

Some scholars assume that those who draw the district lines are motivated by incumbent protection, whereas others believe the motivation is partisan advantage, but even the briefest discussion with participants in the process indicates that redistricters are concerned with both. Indeed, these are often competing goals: incumbents are often forced to give up votes (hence electoral safety) in order to increase the number of legislative seats their party is likely to capture. The tension between the goals of individual and partisan advantage creates yet additional uncer-

tainty about the outcome of a redistricting. Since political party gain is the most predictable common ground for otherwise competing incumbents, party advantage will often take precedence over individual incumbents' advantage in the ultimate political compromise represented by a redistricting plan.

Moreover, not only do redistricters attempt to maximize the competing goals of incumbency protection and partisan advantage, but incumbency protection is itself composed of competing goals: winning the general election and winning (or avoiding) the primary election. These goals conflict because adding too many of a legislator's political party members to his or her district (hence piling up expected votes in the general election) might leave the incumbent vulnerable to a now larger opposition faction within his or her party primary.³

In addition to the high levels of political conflict and uncertainty and the conflicting goals of those who draw the district lines, the entire process includes several severe legal and political constraints. These include the requirements of equal population, contiguity, compactness, minority representation, maintaining communities of interest, not splitting local subdivisions, and especially protecting some incumbents, all within the context of complicated local geography. Other constraints are much less widely recognized but no less important to incumbents, such as the inclusion of the right political contributors, the exclusion of prospective challengers, and the keeping of each favored incumbent's several district offices within the district.⁴

Thus, in our view, the key to understanding the effects of redistricting is to view redistricters as trying to achieve consensus among—or impose a solution on—incumbents who are operating in an extremely uncertain environment and attempting to reconcile at least three competing goals: to maximize their probability of winning or avoiding a party primary, to win a general election (conditional on winning the primary), and to increase their political party's seat advantage. The resulting redistricting plan is usually a compromise, heavily influenced by numerous formal and informal constraints, which generally weights the political party's overall seat advantage most heavily.⁵

We shall evaluate, and then resolve, two important scholarly disagreements about the effects of legislative redistricting on two features of American democratic electoral systems: electoral responsiveness and partisan bias. Both sides in each debate are inconsistent with part of the substance of redistricting as just portrayed. The results of our analyses define and establish new positions. They do not fully support either side in what were previously portrayed as either/or debates but are consistent with the political substance of legislative redistricting discussed here. Our empirical analysis also succeeds by using more powerful methods, more accurate information about more redistricting plans, and dozens of times more data than have heretofore been brought to bear on these problems. Our empirical results have important counterintuitive policy implications, since, in total, they imply that the existence of legislative redistricting—and even partisan-controlled gerrymandering—has beneficial effects on American electoral systems, increasing electoral responsiveness and reducing partisan bias.

THE SCHOLARLY DEBATE AND PROPOSED RESOLUTIONS

We shall begin by introducing the scholarly debates, proposing resolutions, and overviewing our empirical results.

Electoral Responsiveness

Electoral responsiveness is the degree to which the partisan composition of the legislature responds to changes in voter preferences. Although closely related concepts exist—including the competitiveness of the electoral system, the probability that an incumbent will lose a reelection bid, the frequency of marginal seats, and the swing ratio—we find electoral responsiveness (which we shall define precisely later) to be the most direct representation of the relevant theoretical concept of interest.⁶

Political scientists have typically taken two contradictory positions about the effect of redistricting on the responsiveness of an electoral system. One set of scholars maintain that partisan and bipartisan redistricting plans reduce electoral responsiveness. For example, Cain writes, "Because incumbents tend to be risk averse—no margin of safety is too much—the result [of a bipartisan redistricting plan] is greater electoral inefficiency and more noncompetitive seats" (1985, 321). Mayhew (1971) and Tufte (1973) also argue that bipartisan redistricting plans are primarily incumbent protection, hence reducing responsiveness of legislative seats to citizen votes. Owen and Grofman (1988) show theoretically that optimal partisan redistricting plans should also produce a less responsive electoral system. A different position has been argued by another group of scholars: "Redistricting has no influence at all on the swing ratio" (Ferejohn 1977; see also Burnham 1974).

This is an important scholarly debate, but neither position is fully consistent with our prior qualitative knowledge. For example, although some incumbents benefit from redistricting, all (or even most) do not. Many of the incumbents of the party not in control of the process will lose support even if they are not actually paired into the same districts. Some will intentionally reduce their general election support in order to avoid a primary. Moreover, because of geographic constraints, redistricting even hurts some incumbents of the party in control. Improving the partisan composition of a district for one incumbent requires modifying the neighboring district boundaries, and neighboring districts are not always conveniently open seats or held by opposition party

members. As a result, in addition to interparty competition, redistricting frequently creates intraparty competition among rational officeholders seeking to maximize their probability of reelection: "[The] scrambling of incumbents can have momentous importance for the election that follows the redistrict-

ing" (Cain 1985, 331).

How could redistricting have no effect on—or even reduce—electoral responsiveness when it loosens the hold of many incumbents of both parties on their electoral constituencies and reduces their chances of reelection? In fact, our empirical results indicate that both prevailing positions in the literature are incorrect. Redistricting (whether partisan or bipartisan) tends, on average, to increase electoral responsiveness (see also Campagna and Grofman 1990; King 1989). Redistricting does this by shaking up the political system and creating high levels of uncertainty for all participants. Moreover, when redistricters draw lines by jointly maximizing the advantages to their party and their incumbents, they create additional uncertainty and also produce a direct increase in responsiveness by attempting to gain partisan advantage by creating more districts with smaller likely victory margins.

Partisan Bias

Ł

Partisan bias is the degree to which an electoral system unfairly favors one political party in the translation of statewide (or nationwide) votes into the partisan division of the legislature. Politicians, journalists, some judges, and many political scientists believe that political parties in control of redistricting produce sizable effects on the degree of partisan bias in the electoral system (see Abramowitz 1983; Born 1985; Cranor, Crawley, and Sheele 1989; Erikson 1972; Gopoian and West 1984; Hacker 1963; Niemi and Winsky 1992). This results in important political consequences. For example, Robert Dixon insists, "Apportionment and districting decisions are primary determinants of the quality of representative

seat advantage and have a large and lasting effect, while the other argues that whatever gerrymanderers maximize, they have only a small or transitory effect. Paradoxically, we find that both sides in this debate are correct. The disagreement appears to lie in a difference over the precise causal question asked. From the perspective of a close observer of the process and the first group of scholars, redistricting certainly has a partisan "effect", but this effect is defined (implicitly) as the consequence of Democraticcontrolled versus bipartisan or Republican-controlled redistricting. The causal effect of interest to this first group is the difference between bias in the electoral system when redistricting is controlled by Democrats versus Republicans (although obviously only one kind of redistricting is observed at any one time). Any good politician knows the consequences of letting the opposition party draw the district boundaries. We find that the difference here is as predicted: on average, redistricting favors the party that draws the lines more than if the other party were to draw the lines. In fact, the effect is substantial and fades only very gradually over the following 10 years.

The second group of scholars in this debate finds no "effects," or else finds effects that disappear quickly over time. It appears that the causal question asked by this group is distinct from the first, focusing not on the difference between Democratic- and Republican-controlled redistricting but on the difference between the consequences of redistricting versus no redistricting. We find that on average, redistricting (either partisan or bipartisan) actually reduces the degree of bias as compared to no redistricting. Most of the especially effective partisan gerrymanders take a political system severely biased in favor of one party and make it slightly biased in favor of the other, hence reducing the overall bias. This result does not contradict the position of the first group, since partisan plans do favor the party in control compared to bipartisan plans, but they all reduce the overall degree of bias compared to what would have been if no redistricting had occurred. We now turn to the

fortunately, adequate information about state redistricting processes have never been compiled. Sources such as Hardy, Heslop, and Anderson 1981 and Cortner 1970 and numerous court cases provide valuable but insufficient information. Previous studies of political gerrymandering either analyze a single case or a few cases in depth (e.g., Cain 1984; King 1989; Scarrow 1982) or use only indirect evidence of partisan control of redistricting (see Morrill 1990 for a partial exception). For example, Erikson (1972), Born (1985), and King and Browning (1987) infer control of redistricting processes indirectly by noting the party that controlled the state legislature and governorship, with special rules to deal with court challenges and other exceptions. (If one party controlled all three, the plan was assumed to have been gerrymandered by that party; if control was split, they concluded the plan was bipartisan.) This inferential procedure has the advantage of being easy to implement and is often correct, but it is misleading in many cases. For example, some state constitutions give control of redistricting to bipartisan commissions, regardless of who controls the government. In other states, the courts have at times implemented the minority party's redistricting plan (on grounds other than political gerrymandering but presumably with the same effect). And in all states, creative maneuvers by politicians, using techniques such as court challenges and legislative impasses, can cause redistricting to occur at times other than immediately following the decennial censuses. Using these indirect methods causes many redistrictings to be missed and many of those not missed to be misclassified.

To avoid problems with existing measures, we conducted an in-depth study of each redistricting process in every state. We mailed a questionnaire to every state legislature, requesting the names and party affiliations of all individuals who participated in the redistricting process, the official and unofficial rules of the apportionment and districting process, copies of the final redistricting bills, and certain district maps. We then interviewed state election officials, state court justices, commission members, attorneys, academics, legislators, and political party officials, as well as looking at many state newspapers and scholarly literature. Throughout, the goal was to gauge the intention, rather than the perceived effect, or publicly stated goal, of a particular redistricting plan. Regardless of whether the redistricting was implemented by a legislature, a governor, a commission, or a court, we categorized each plan by its partisan intention. We finished collecting the redistricting data before calculating any estimates from our electoral data to eliminate possible coder-induced endogeneity (in fact, an early version of our data were used almost three years ago; see Niemi and Jackman 1991). From this information, we identified 60 redistrictings and classified each as Democraticcontrolled, Republican-controlled, or bipartisan. ⁹ The states, years, and classifications of the redistrictings appear in Appendix B.

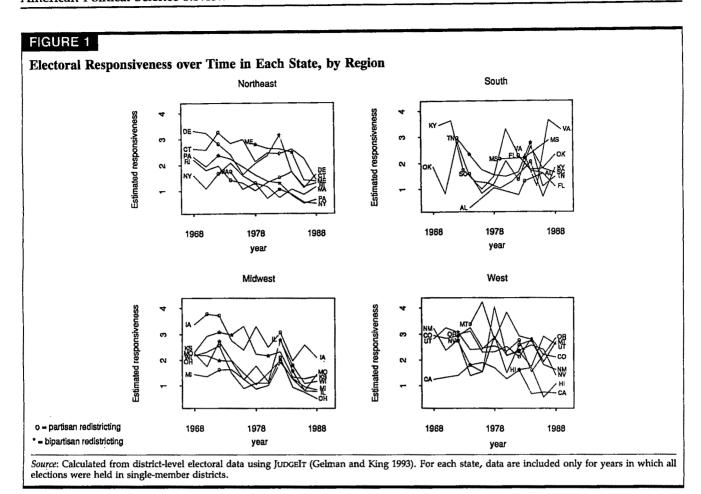

DEFINING AND ESTIMATING ELECTORAL RESPONSIVENESS AND PARTISAN BIAS

We estimate electoral responsiveness and partisan bias in each state legislature, for each of the 267 election years, using the model described by Gelman and King (1994) and the associated computer program. Although we developed this statistical model to estimate bias and responsiveness in legislative data, it has numerous other applications. This methodology is briefly summarized in Appendix A. For each state and election year, we calculate a point estimate and standard error for electoral responsiveness and partisan bias and the same quantities in the counterfactual situation in which all incumbents suddenly retire; we use these for all subsequent analyses. Results from our numerous auxiliary analyses not reported here, with alternative measures of these and related concepts, strongly support our substantive conclusions described. For each state election in the data set, our estimates of electoral responsiveness and partisan bias, along with the number of seats in the legislative house, appear in Appendix B.

In order to define these concepts more precisely, we define \bar{v} to be the average Democratic proportion of the two-party vote across districts in the state (corrected for uncontested seats; see Gelman and King 1994 for details) and \bar{s} to be the Democratic proportion of the seats in the legislature. We also account for the effects of differential turnout. To each state's electoral system in each election year, we estimate electoral responsiveness and partisan bias. (We take our definition of these concepts from King and Gelman 1991, which generalized the definitions introduced in King and Browning 1987 and King 1989.)

Electoral Responsiveness

We define *electoral responsiveness* as the change in the expected seat proportion given a small change in the vote proportion, from slightly more Democratic than the average district vote to slightly more Republican (see King and Browning 1987; Gelman and King 1994). For present purposes, we use a swing of 1% in each direction from the election outcome: responsiveness is the average difference, $[E(\bar{s}|\bar{v}+.01)-E(\bar{s}|\bar{v}-.01)]$, divided by the vote swing, .02.¹¹ For example, a value of responsiveness of 1.0 is (in the absence of bias) de facto proportional representation. A value of 2.0 (approximately the average value across all the data we analyze) indicates that a 1% increase in the average district vote share for Democratic candidates statewide will produce a 2% increase in the Democratic share of the state legislature. Scholars of American politics almost uniformly take the normative position that higher values of responsiveness indicate a healthier democracy (e.g., Ferejohn 1977). (In stark contrast, scholars from most other countries prefer proportional representation and therefore lower values of responsiveness nearer 1.0; a valuable

topic for future research would be to work out the conditions under which each normative standard is most appropriate.) Figure 1 presents a descriptive view of electoral responsiveness over time in each state in our data set. Most states have responsiveness values between 1.0 and 3.0. Except for the South, responsiveness has gradually dropped over time, just as in the U.S. Congress (King and Gelman, 1991). As the Republicans have gained strength in the South, the legislatures of southern states have become more competitive with increasing electoral responsiveness.

Partisan Bias

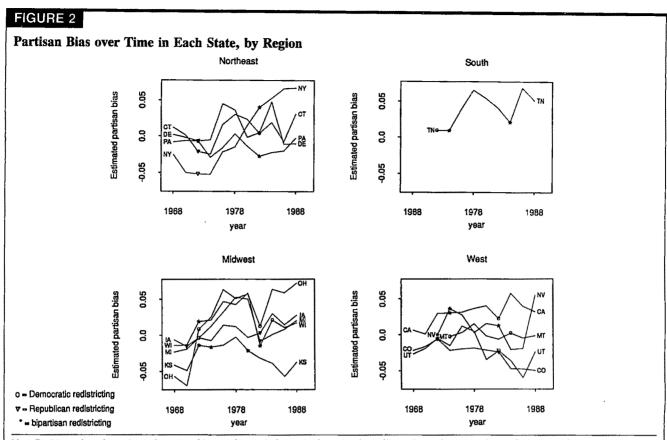

Partisan bias is the deviation from partisan symmetry when the average district vote is between $\bar{v}=.45$ and $\bar{v}=.55$. For example, if one party is able to translate 55% of the average district vote into 75% of the seats in the legislature, then it would be symmetric for the other party, too, when it receives 55% of the average district vote, to receive 75% of the seats. We define partisan bias as the proportion of the seats in the legislature that the Democrats receive over and above what is fair according to this symmetry criterion. A positive bias favors the Democrats, whereas a negative value for bias indicates that the electoral system favors the Republicans. For example, if partisan bias is -.05, then the Democrats receive 5% fewer seats in

the legislature than they should under the symmetry standard (and the Republicans receive 5% more seats than they should).

Unlike electoral responsiveness, estimating partisan bias requires imagining what would happen if the minority party were to become the majority party in some future election. Although this is obviously possible in any state, it is extremely unlikely in some. Forecasting what would happen if, for example, the Republicans suddenly won a majority of the Alabama legislature is beyond the scope of any empirical analysis. We therefore limit our analysis to "competitive electoral systems," which we define as states in which each political party managed to garner a majority of seats or votes in at least one election between 1968 to 1988. For the analysis of bias, this reduces our data set to 16 states and 164 elections. Less restrictive definitions of competitive do not materially change our substantive results. 12

Figure 2 displays our estimates of partisan bias over time in each state (only for "competitive electoral systems"). Most of the bias figures are between 5% favoring the Democrats to 5% favoring the Republicans. Partisan bias in these states seems to be trending from favoring the Republicans to favoring the Democrats. This is also true of the U.S. House (see King and Gelman 1991).

Finally, we also estimate what values each of these three quantities would be if, at the start of each

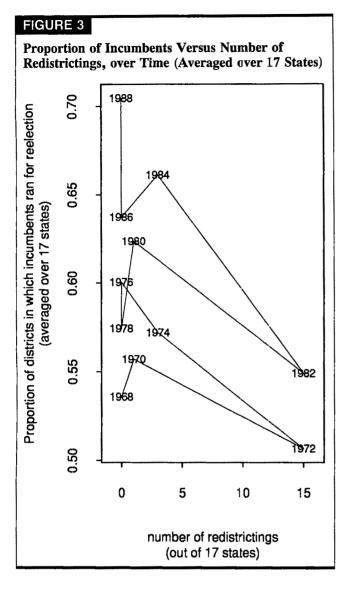

Note: Positive values for estimated partisan bias on the vertical axes in these graphs indicate electoral systems that unfairly favor the Democratic Party; negative values indicate bias in favor of the Republican Party. Calculated from district-level electoral data using JUEGEIT (Gelman and King 1993). For each state, data are included only for years in which all elections were held in single-member districts. Only states with competitive electoral systems are included.

election campaign, all incumbents decided not to run. This simulated universal term limitation helps us ascertain the role of incumbents in redistricting. We omit the analogous time series plots of these figures, but to gain an understanding of the changes in incumbency over time, we present Figure 3. For each year in the data set, this figure displays the number of redistrictings in that year by the proportion of incumbents running for election. 13 A line connects the points so one can easily trace the path of the electoral system over time. Two patterns are clearly evident in this graph. First, from 1968 to 1988, the proportion of incumbents has increased from about 50% to nearly 70%, as portrayed in the graph by the line headed steadily upward. Second, the proportion of incumbents clearly decreases during redistricting years. Figure 3 also portrays an important effect of redistricting. Some incumbents are undoubtedly "retired" involuntarily by redistricting plans that eliminate their political base or pair them in districts, forcing them to run against each other. However, many other incumbents probably also retire to avoid the huge political fight of redistricting itself. If a state legislator were thinking of retiring (or running for another office) at some time over the next few elections, then planning an exit to coincide with a redistricting would save a lot of grief, if not political defeat.

A REGRESSION MODEL

We conduct parallel analyses of electoral responsiveness and partisan bias. Each variable has the state election year as the unit of analysis (n = 267 for responsiveness and n = 164 for bias). The core analysis involves a straightforward regression model using each of these dependent variables in turn. We present the regression analysis of each numerically and then provide a further interpretation of these regression results with two forms of graphical analysis.

We denote Y_{it} as the dependent variable (electoral responsiveness or partisan bias), minus its mean, for election year t and state i. ¹⁴ In addition, we define the following explanatory variables: 15 redistricting, R_{it} , is 1 if a redistricting occurred immediately before election year t in state i, and 0 otherwise; partisan redistricting, P_{it} , is .5 if a redistricting occurred immediately before election year t in state i and was exclusively controlled by one of the major political parties, -.5 if the redistricting was bipartisan (controlled by both parties), and 0 otherwise; democraticcontrolled redistricting, Dit, is 1 if the Democratic party controlled the redistricting immediately before election year t in state i, -1 if the redistricting was Republican-controlled, and 0 otherwise; and state effects, S_{ii} , are a set of 0/1 dummy variables representing the states.

Regressions for Electoral Responsiveness. We do not use all the explanatory variables for each regression. To assess the effects of redistricting on electoral responsiveness, we estimate the following linear regression:

$$E(Y_{it}) = \beta_1 R_{it} + \beta_2 (Y_{i,t-1} R_{it})$$

$$+ \beta_3 P_{it} + \beta_4 Y_{i,t-1} + \gamma S_{it}$$
, (1)

where β_1 , β_2 , β_3 , and β_4 are regression coefficients, γ is a vector of regression coefficients, and $(Y_{i,t-1}R_{it})$ is an interaction term calculated by taking the product of the lagged dependent and redistricting variables.¹⁶

Inclusion of the state variables, S_{it} , is a standard procedure recommended in time series cross-sectional literature, where it is called a "fixed effects model" (Hsiao 1986; Stimson 1985). These variables enable us to pool different states safely, guaranteeing that we are comparing (for example) New York in one year with New York in another, rather than New York in one year with Rhode Island in another. (Including all the state variables also makes the constant term in the regression unnecessary.) From a

theoretical perspective, a random effects model might be preferred (e.g., Dempster, Rubin, and Tsutakawa 1981). We repeated all our regressions with random state effects and found no major substantive changes in the results.¹⁷

As such, estimating the coefficients in γ is important, but the values they take on are not of direct interest; we therefore omit these from our tables. The remaining coefficients are of interest and are interpreted as follows: β_1 is the average effect of any redistricting in increasing Y (responsiveness or bias); β_2 is generally negative, indicating how much larger the effect of redistricting is for small previous values of Y and how much smaller it is for larger values of Y (β_2 is, equivalently, the drop in the persistence in the level of responsiveness between two elections due to a redistricting intervening); β_3 is the additional constant effect of partisan versus bipartisan redistricting over and above the average effect; and β_4 indicates the persistence of Y over time in the absence of redistricting.18

Regressions for Partisan Bias. To estimate the effects of redistricting on partisan bias, we change equation 1 only by substituting P_{it} with D_{it} . This changes the interpretation of β_3 to the constant effect of Democratic-versus Republican-controlled redistricting over and above the average effect. The interpretation of the other coefficients does not change.

It should be possible to improve our model if additional data become available, but in the many alternative models and diagnostic tests we tried, we found no evidence to contradict the model in equation 1. We also found the error distribution and autocorrelation structure of the data to be consistent with the time series behavior of the model.¹⁹

Although we found no evidence of nonlinearities, the empirical independence of the lagged dependent variable and the redistricting variables makes our specification unreliant upon the linearity assumption in estimating our key causal effects. Finally, the substantive results we are about to present were robust across all reasonable specifications that were consistent with the data.

EVIDENCE

We present our empirical results first for electoral responsiveness and then for partisan bias. We conduct the analyses in each of these sections in analogous fashion and explain our procedures in most detail in the first.

Electoral Responsiveness

Our regressions explaining electoral responsiveness appear in Table 1. Column 1 reports the estimated regression effects (with standard errors in parentheses) on the actual level of responsiveness. Column 2 reports estimates for a regression with the same explanatory variables but with a forecast of what

TABLE 1

Effects of Redistricting on Electoral Responsiveness: Regression Estimates

EXPLANATORY VARIABLE (PARAMETER)	ACTUAL	NO INCUMBENTS RUNNING
Redistricting (\hat{eta}_1)	.47 (.08)	.98 (.11)
Redistricting interaction $(\hat{\beta}_2)$	- 17 (.10)	20 (.11)
Partisan redistricting (\hat{eta}_3)	−.23 (.16)	32 (.21)
Lagged responsiveness $(\hat{\beta}_4)$.38 (.06)	.17 (.06)
Residual standard deviation ($\hat{\sigma}$)	.51	.64

Note: Entries are coefficients from a weighted least squares regression; standard errors appear in parentheses. N=237 election years (we dropped the first case in each state so that we could regress on the lagged variable). The state effects, S_{tt} , are also included in the regressions but are omitted from the table because their coefficients are not of direct interest.

electoral responsiveness would be under the situation with no incumbents running as the dependent variable. We discuss these coefficients here, followed by a more detailed interpretation in several figures.

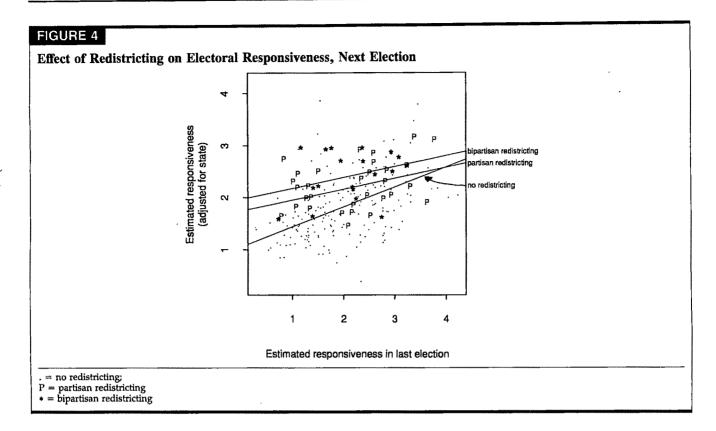

The primary effect indicates that on average, redistricting increases responsiveness by about half a point (.47 plus or minus the .08 standard error). This is a substantial effect, consistent with our qualitative understanding that redistricting creates uncertainty by shaking up the political system and that redistricters are maximizing competing goals. Table 1 also indicates that the effect on responsiveness in a hypothetical electoral system without incumbents is even larger. Put differently, by adding incumbents into the electoral system and redistricting process, the increase in responsiveness that results from redistricting is lessened. We attribute this effect to incumbents trying to maximize their probability of winning the general election, since our analysis holds constant all the other constraints we have observed.

The "redistricting interaction" coefficient indicates that the effect of redistricting is slightly larger when responsiveness is low, and smaller for higher values of responsiveness. This is a "regression to the mean" that pushes the effects of all types of redistricting toward a common level. The effect is not much larger than its standard error, but our many experiments with auxiliary regressions testing this hypothesis convinces us that this effect, although small, is real. As expected, the effect of partisan versus bipartisan redistricting is small and imprecisely measured. The lag of responsiveness indicates that in nonredistricting years, redistricting has a moderate level of persistence, meaning that it is possible to forecast responsiveness from its previous values (and the state coefficients). Put differently, in the absence of redistricting, electoral responsiveness is moderately persistent across elections. However, when a redistricting occurs between these two elections, most of this persistence vanishes (since $\hat{\beta}_4 + \hat{\beta}_2$ is small). Moreover, virtually all of the persistence of responsiveness across a redistricting is due to the presence of incumbents (since $\hat{\beta}_4 + \hat{\beta}_2$ is approximately 0 for Table 1, column 2).

That the persistence of responsiveness across a redistricting is due largely to the incumbents and their districts is consistent with information we gathered in interviews with district-map-makers. That is, those nominally in charge of redistricting, as well as the people who sit at the computers, drawing lines on maps, almost uniformly report that finding satisfactory districts for incumbents is their most important constraint. They also report that the constraint posed by the presence of incumbents is the one of the biggest factors in making their job difficult.

Immediate Effects of Redistricting on Responsiveness. Figures 4 and 5 portray the effects of redistricting on responsiveness graphically, displaying both the data and the regression results in Table 1. Figure 4 illustrates the immediate effects of redistricting by plotting the lagged value of responsiveness by the current value (adjusted for the state effects by subtracting from each value the estimated coefficient for the corresponding state dummy variable). This figure highlights every data point as well as all the regression coefficients; it also emphasizes exactly how the regression summarizes the data in this case. Each of the 237 state elections appears in this plot as a dot (for elections without redistrictings), an asterisk (for years preceded by bipartisan redistrictings), or the letter P (for years preceded by partisan redistrictings). For each point, the responsiveness estimated from that statewide election appears on the vertical axis (after being corrected for the appropriate state effect), and the estimated responsiveness in the state's previous election is shown on the horizontal axis. The most important effect in this figure is that most of the points labeled P and * are higher on the vertical axis (for a given value of the horizontal axis) than the dots. This shows directly that responsiveness is higher in years following redistricting even after controlling for responsiveness in the previous election (and adjusting for state means).

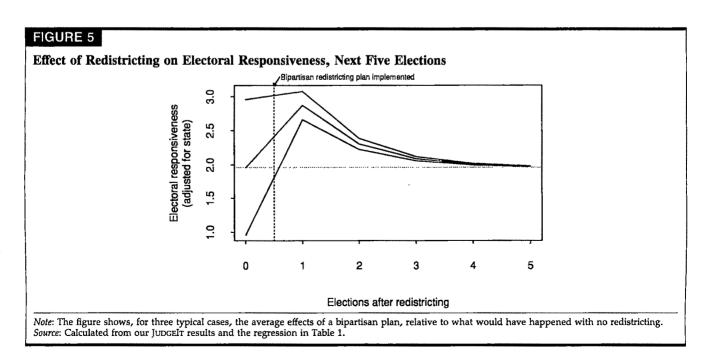

We also plot the regression lines, fitted to the three types of election years, to help highlight average effects. The coefficient of lagged responsiveness, $\hat{\beta}_4$ = .38, is the slope of the line labeled "no redistricting." The increase in responsiveness due to redistricting is portrayed by the vertical distance between the noredistricting line and the partisan or bipartisan redistricting lines. The distance between the differently sloped lines at the center of the graph is the average effect of redistricting: $\hat{\beta}_1 - \hat{\beta}_3 = .70$ for bipartisan and $\hat{\beta}_1 + \hat{\beta}_3 = .24$ for partisan redistricting. The difference between the slopes of the regression line is $\hat{\beta}_2 = -.17$. As can be plainly seen, the effect of redistricting is large for small values of lagged responsiveness (at

the left). Or, equivalently, the persistence of responsiveness (as represented by the steepness of the line) is much greater in the absence of redistricting.

Figure 4 helps convey, better than the coefficients in Table 1 can alone, the appropriateness of our regression model for this problem. (For example, one can see the dots on this graph clearly clustered around the no-redistricting line and below the asterisks and *Ps.*) Perhaps the most important feature of

the graph, confirming that the assumptions of our regression model cannot be rejected by the data, is the absence of any systematic pattern in the data points except those picked up by the regression lines. Finally, Figure 4 shows the unpredictability of redistricting: even after controlling for the lagged responsiveness and state effects, the points on the graph are quite variable. The strong average effects revealed by the regression do not apply to all individual cases.

Longer-Term Effects of Redistricting on Responsiveness. Figure 5 displays the average effects on responsiveness (relative to any trend) for the five elections following a redistricting. The horizontal axis indicates the number of elections since redistricting, with the vertical dashed line indicating the implementation of a bipartisan redistricting plan. To show the differential effects of redistricting, Figure 5 gives three examples, distinguished by the level of responsiveness in the election before redistricting. All three examples show again that, on average, redistricting sharply increases responsiveness in the first election, with the largest effect occurring for states that had low responsiveness before the redistricting. The effects in the graph are calculated from the regression in Table 1 and the implied AR(1) time series model.

Figure 5 shows that the average redistricting effect is very large in the first year, moderate in the second, much smaller in the third, and nonexistent for the fourth and last years. The effect of redistricting in increasing responsiveness does not last until the fifth election, implying that redistricting is unlikely to contribute to longer-term trends. Hence, the existence of many redistrictings increasing responsiveness is consistent with a secular decline in responsiveness over the two decades in our study (see Figure 1). However, this pattern does not mean that the effect of redistricting on responsiveness is unimportant. On the contrary, in the typical state, redistricting occurs after every fifth election, and, as a result, its electoral system benefits from higher levels of responsiveness for roughly half of all elections solely because of redistricting. Redistricting thus boosts the responsiveness of a state electoral system significantly higher than it would otherwise be for about half of all elections. Although any single redistricting does not have permanent effects, the decennial redistricting process is a permanent part of every state's electoral system. As a result, redistricting continually and fundamentally alters the character of representative democracy.

Partisan Bias

In addition to its effect on responsiveness, legislative redistricting has an important effect on the relative fortunes of the political parties. Redistricting can affect the proportion of seats that a party controls in the legislature in two ways. The first, which has been the subject of speculation in the literature but only rarely of empirical analyses, is the effect of redistricting on the average district vote. The second is what we call partisan bias—the effect of redistricting on the allocation of seats between the parties given their average district votes. The ultimate effect of redistricting on the division of parties in the legislature is the sum of these two effects. One can use the seat proportion as the dependent variable in a separate regression to estimate this sum directly. Like most researchers, we prefer a separate estimate of the effects on partisan bias so that we can judge the fairness of the electoral system.

TABLE 2

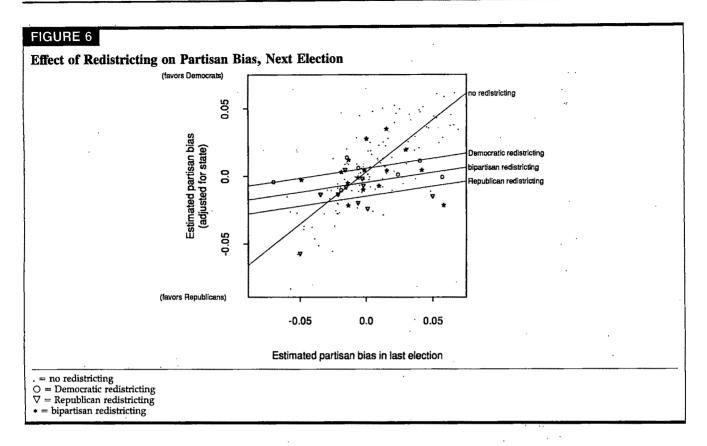

Effects of Redistricting on Partisan Bias: Regression Estimates

EXPLANATORY VARIABLE (PARAMETER)	ACTUAL	NO INCUMBENTS RUNNING
Redistricting $(\hat{\beta}_1)$	012 (.004)	012 (.004)
Redistricting interaction $(\hat{\beta}_2)$	63 (.12)	77 (.16)
Democratic redistricting $(\hat{\beta}_3)$.010 (.005)	.003 (.006)
Lagged bias (\hat{eta}_4)	.77 (.07)	.55 (.09)
Residual standard deviation (ô)	.014	.015

Note: Entries are coefficients from a weighted least squares regression; standard errors appear in parentheses. The dependent variable is estimated partisan bias; as in Figure 2, where this variable is displayed, positive values indicate state electoral systems which favor the Democrats and negative values indicate bias in favor of the Republicans. N=143 election years (all but the first election in our data set for all states whose electoral systems were "competitive"). The state effects, S_{tt} , are also included in these regressions but are omitted from the table because their coefficients are not of direct interest.

Immediate Effects of Redistricting on Partisan Bias. We begin by estimating the regression with bias as the dependent variable, conducted in a manner parallel to that for responsiveness. The results appear in Table 2. Many of the key results here are easier to interpret in conjunction with the graphs in Figures 6 and 7. To begin, note that Figure 6 indicates that partisan bias is rarely greater than about 8% (on both axes) in favor of either party. We believe this is because of the numerous constraints on gerrymanderers, as described in the introduction. We turn now to the effects of redistricting on bias by looking first at the baseline of the effect of lagged bias on current bias in the absence of redistricting. This is portrayed in Figure 6 as a no-redistricting line with the steep slope of $\beta_4 = .77$ and indicates that in the absence of redistricting, the level of bias tends to persist much longer than for responsiveness. Because the slope of this line is almost 1, partisan bias changes very little in the absence of redistricting. We therefore expect that whatever effect redistricting has on bias, its effect will take a long time to dissipate.

From this baseline, we can now examine the effects of redistricting. On average, redistricting makes the typical state's electoral system fairer (closer to zero bias) than it would be if redistricting had not occurred. This effect is illustrated in Figure 6 by the asterisks, circles, and triangles (indicating that bipartisan, Democratic, or Republican redistricting, respectively, occurred between the two elections), which are generally much closer to 0 on the vertical axis than the dots (election years without redistricting). This means that state electoral systems are closer to no partisan bias following redistrictings.

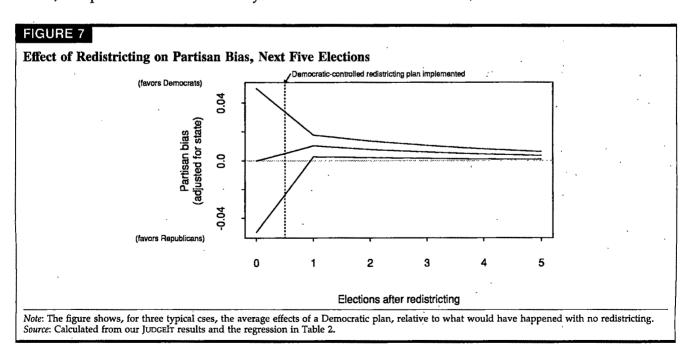

This effect is summarized by the three redistricting lines being much flatter (and closer to 0 on the vertical axis for most of the range of the horizontal axis) than the no-redistricting line. (The difference in the slopes of the redistricting and no-redistricting lines is the redistricting interaction coefficient, $\hat{\beta}_2 = -.63$.)

Thus, no matter how fair or biased the electoral system is to begin with, the typical redistricting plan, whether Democratic, Republican, or bipartisan-controlled, will produce a fairer electoral system.²¹ This

ĸ.

result is consistent with evidence from individual cases in which the largest effects of redistricting change an existing huge bias in favor of one party to small bias in favor of the other.²²

The reason that any redistricting reduces bias appears to be the role that redistricting has in shaking up the political system in combination with the many constraints on the mapmakers. Shaking up a system that is effectively constrained to have partisan bias between about $\pm 8\%$ of fairness cannot have an enor-

mous effect (although much smaller effects will be quite significant to individual incumbents and political parties). Moreover, if there is already a high level of bias, due to the previous decade's redistricting (or, more likely, to demographic and mobility changes in the population over the decade), any political turmoil will have a higher probability of moving the system toward fairness since there is simply more room to move in that direction.

This powerful role redistricting has in producing fairer electoral systems does not imply that Democratic redistrictings produce the same result as Republican or bipartisan ones. To the contrary, the order of the three redistricting lines in Figure 6 (and the effect $\hat{\beta}_3$ in Table 2) indicates that Democraticcontrolled redistricting plans typically bias the electoral system toward the Democrats by about 1% (with a standard error of .5%) more than a bipartisan plan. Republican-controlled plans favor the Republicans by about the same amount. Thus, the difference between a Democratic- and Republican-controlled redistricting plan is, on average, an increase in partisan bias of about 2% for the party in control (and a corresponding decrease of about 2% for the other party).²³ The variability of individual results in Figure 6 also indicates that redistricting can have somewhat more or less powerful effects than the average results summarized by the regression lines. With fewer data, less efficient statistical methods, or less careful categorization of redistrictings by partisan control, we may not have been able to distinguish the systematic partisan effects of redistricting from the inherent variability in the system (as seemed to be the case with some existing research).

Finally, Table 2, column 2, displays the effects of redistricting on partisan bias in the hypothetical situation where no incumbents run for reelection. The partisan effect of redistricting, β_3 , is statistically (and substantively) indistinguishable from zero in this case. Since incumbents are key actors in either drawing the lines or influencing the line-drawers, this result is fully consistent with the substance of redistricting that we portrayed in the introduction. Incumbents lead the troops into most redistricting battles. That they and their vote-getting abilities would be considered as givens when drawing the district lines is just what we would expect. If, as in our counterfactual condition, many incumbents were unexpectedly defeated, the redistricting might turn out to have very different political consequences.

Thus, partisan-controlled redistricting plans produce electoral systems that favor the party in control more than the opposition party. However, the range of possible outcomes that any redistricter is able to produce, given the complicated constraints and uncertainties, is usually in the neighborhood of nearzero bias. The differences within this neighborhood are still highly significant to the partisans (as we shall further demonstrate), but the overall existence of redistricting constrains bias to within this small and comparatively fair range.

Longer-Term Effects of Redistricting on Partisan Bias. We examine the effects of redistricting on partisan bias over the next five elections with Figure 7, which is based on the regression (and the implied autoregressive time series model with interventions) in Table 2, column 1. This figure is directly analogous to Figure 5, except that the only intervention represented here is a Democratic-controlled redistricting plan. (Estimates for the effects of a Republican-controlled plan are a mirror image of these.) As can be seen clearly by the three lines converging from election year 0 to election year 1, large Republican and even Democratic biases are substantially reduced because of this redistricting. However, the Democrats still produce an electoral system biased in their favor, since all three lines are above zero. Finally, we can see that this immediate effect persists in large measure over the remaining election years before the next redis-

Effect of Redistricting on the Average District Vote

We studied the effect of redistricting on votes with the same regression model we developed for bias but using \bar{v} in place of bias as the outcome variable and also including dummy variables for each election year, to control for national swings in the vote. The results indicate that partisan redistrictings increase the proportion of votes for the candidates of the controlling party by an average of about 1% (plus or minus a standard error of .5%) as compared to a bipartisan redistricting. Because responsiveness averaged over all states and elections in our data is about 2.0, this effect on votes typically increases the seat proportion for the party controlling the redistricting by about 2% (the 1% effect on votes multiplied by the typical responsiveness of 2.0) as compared to bipartisan control. Thus, the difference in seats between a Democratic- and Republican-controlled redistricting plan is, on average, a substantial 4% of seats. The causal mechanism by which this effect works is probably as follows. A partisan redistricting produces additional districts that the party in control of redistricting is likely to win, as we have demonstrated. As a result, this party finds it easier to field better candidates, which, in turn, produces more votes for those candidates (see Cain 1985; Canon, Schousen, and Sellers 1993).²⁴

Unlike the other regression models estimated herein, the regression for votes relies very heavily on the assumption of linearity in order to establish the causal effect of redistricting. The reason is that only in the model for votes are the key causal effects (the redistricting variables) highly correlated with one of the control variables (lagged votes). That is, states with higher Democratic vote proportions in the election before redistricting are more likely to have Democratic-controlled redistricting plans implemented. The correlation with the lagged variable is much weaker in the regressions for bias and responsiveness. The dependence on the linearity assumption of our inference for the effect of redistricting on votes is

well within the standards followed throughout the social sciences where key causal variables are often highly correlated with important control variables. As such, we are confident of these estimates. However, we do not proceed with more detailed analyses of this effect (including such features as its persistence over time, as we did for responsiveness), since they would not be as certain as all other results herein, where we are in the fortunate situation of having causal inferences that meet even higher standards (and thus greater certainty) than usual.

Total Effect of Redistricting

Finally, we can add the effect of redistricting on partisan bias (seats given a fixed average district vote) to the effect of redistricting on the division of votes between the parties. This sum gives the total effect of redistricting on the division of seats in the legislature between the parties: if one party controls a redistricting plan, it can expect, on average, to receive approximately 6% of the seats that the other party would have won if it controlled the redistricting. That is, the party drawing the district lines receives, on average, about 6% more seats—and the opposition party 6% fewer seats-than if the opposition party had controlled the mapmaking. Thus, even though redistricting makes the electoral system substantially fairer overall than if there were no redistricting, the difference between Democratic and Republican control over the drawing of district maps is still one that politicians are rightfully concerned about.

We also estimated the effect of redistricting on seats directly, by regressing seats \bar{s} on redistricting type, controlling for state effects, lag seats, the lag-redistricting interaction (as usual), and election year effects. The results of this regression—an effect of 3.2% for the party controlling redistricting, with a standard error of 1.3%—are consistent with our separate analysis of votes and bias. (An effect of 3.2% for partisan redistricting corresponds to 6.4% when comparing Democratic to Republican plans.) In general, we prefer to analyze votes and bias separately, because each is an important consequence of the partisan effect of redistricting. 25 We see the direct regression of seats as a confirmation of our more important results.

CONCLUDING REMARKS ON THE BENEFITS OF REDISTRICTING

As described, our empirical results are consistent with the conflictual and uncertain process of legislative redistricting and the competing goals of redistricters. They also help resolve two important controversies in American politics over the consequences of legislative redistricting for partisan bias and electoral responsiveness. For one, our results demonstrate that contrary to all previous researchers, redistricting in state legislatures has substantially increased elec-

toral responsiveness and kept it higher than it would be otherwise for about half of all elections in each state. The effects of any one redistricting are not permanent, but the decennial redistricting process repeatedly injects the political system with a healthy dose of increased responsiveness. For partisan bias, we have identified a difference in the causal question asked by two groups of researchers, making both sides in this controversy correct to a degree. Our results indicate that partisan and bipartisan redistricting plans reduce bias overall, leading to fairer electoral systems than if there had been no redistricting, but the difference between Democratic-, bipartisan-, and Republican-controlled redistricting plans within this smaller and comparatively fairer region are still politically significant.

We now briefly organize these results from two perspectives. First, individual legislators involved in redistricting can be seen as simultaneously attempting to maximize three partly inconsistent goals: they try to increase the probability of winning or avoiding a primary, winning the general election (conditional on winning the primary), and helping their party win a majority of seats in the legislature. Those responsible for drawing the district lines, whether partisan or bipartisan, always operate in a highly constrained and uncertain environment. The final redistricting plan is usually the result of the process of achieving

consensus among incumbents and others, subject to

the formal and informal constraints; this process

usually produces a plan that weights party advantage

heavily. When incumbents give up votes in order to increase the probability of being in the majority party, responsiveness increases. It also increases when other incumbents retire to avoid the political fight altogether and due merely to changes in district lines and to wholesale increases in uncertainty. Giving up votes in this way also means that Democratic-controlled redistricting plans usually favor the Democrats more than those controlled by the Republicans. However, in order to retain their seats, they do not go too far in trying to achieve this goal. Hence, partisan bias does not favor their party as much as it could. These constraints on partisan bias during redistricting are much more substantial than during the rest of the decade, when changes in demographics, turnout, and the configuration of candidates can cause comparatively larger changes in bias and responsiveness.

A second way to organize these results is to review what they say about the benefits and costs of redistricting for states' representative democracies. The purpose of reapportionment and redistricting is to guarantee that the number of citizens in each district if roughly the same, at least at the start of each decade. Redistricting obviously accomplishes this minimal goal. However, as most political scientists recognize, population equality guarantees almost no form of fairness beyond the numerical equality of population. Even aside from issues raised by counting citizens (rather than voting-age Americans or voters), by representing ethnic minorities fairly, or

attempting to ensure that each citizen has an equal say in the policy outcome (which may be impossible to achieve, given such internal legislative rules as seniority on committees), there are the questions of what redistricting does intentionally or unintentionally to the features of our representative democracy that we have discussed here. Allowing state legislators to redistrict opens up the possibility of partisan gerrymanders, incumbent protection plans, and other apparently insidious consequences of the simple task of drawing district lines around equal-sized groups of Americans.

The vast majority of American political scientists have adopted the normative position that healthy representative democracies have low levels of partisan bias and high levels of electoral responsiveness. Our empirical results should make those who support this dominant position yearn for the next redistricting period. The political turmoil created by legislative redistricting creates political renewal. Many of the goals sought by proponents of term limitations are solved by legislative redistricting. Even the reputation of the "egregious" partisan gerrymander has been somewhat rehabilitated: not only does redistricting perform the simple task of getting the numbers right, but redistricting has tended to reduce partisan bias and increase electoral responsiveness.

It is true that bipartisan redistricting produces as high levels of responsiveness and lower levels of partisan bias than partisan-controlled redistricting plans. Moreover, Democratic- and Republican-controlled plans have very different consequences for the parties. One can also still find specific examples of substantial partisan gerrymanders that produce much more partisan bias. These results provide good reason to support a proposal to require bipartisan control of all redistricting processes. If a legislature is incapable of forging a bipartisan agreement, then alternating, or randomly assigned, control of redistricting would also accomplish many of the same benefits. Our results demonstrate that earlier objections to this proposal based on the belief that it will usually create incumbent protection plans (and hence unresponsive electoral systems) are unfounded.

Finally, our results bear directly on the role the courts might choose in resolving partisan gerrymandering claims. The U.S. Supreme Court declared partisan gerrymandering to be justiciable in *Davis* v. Bandemer (1986), but it has not yet made clear whether the standards of fairness will be set so that a plaintiff would have a chance of meeting them. On the basis of its recent decisions (e.g., Voinovich v. Quilter 1993), it seems clear that the Supreme Court would probably prefer not to be involved in partisan redistricting matters, and our results provide them with a clear public policy justification.²⁶ Individual state redistricting plans sometimes do produce very unfair electoral systems, but on average, recent state redistrictings, even when unattended by the courts, have reduced partisan bias and increased responsiveness. Far from being a scourge on the political system in need of major reforms, legislative redistricting has invigorated American representative democracy.

APPENDIX A: ESTIMATING **RESPONSIVENESS AND BIAS**

We used the method of Gelman and King (1994), implemented in our computer program called JUDGEIT (Gelman and King 1993), to estimate the electoral responsiveness and partisan bias from individual district-level data in each state legislative election. The results of these estimations are displayed in Figures 1 and 2. (JUDGEIT and the statistical model underlying our method are described in detail in Gelman and King 1994.) Our method is a straightforward and substantially improved version of our previous method (see Gelman and King 1990; King and Gelman 1991) for defining, estimating, predicting, or evaluating under counterfactual conditions concepts such as seats-votes curves, partisan bias, electoral responsiveness, the expected or predicted vote in each district in a legislature, the probability that a given party will win the seat in each district, the proportion of incumbents or others who will lose their seats, the proportion of women or minority candidates to be elected, the incumbency advantage and other causal effects, the likely effects on the electoral system and district votes of proposed electoral reforms (e.g., term limitations, campaign spending limits, and drawing majority-minority districts), and any other properties of an electoral system that can be defined in terms of vote shares in districts. The method is based on a statistical model that can be applied to virtually any legislature with two major parties and plurality rule elections in districts.

Here we shall briefly outline how our model is applied to estimating responsiveness and partisan bias. As described, we define these quantities based on the seats-votes curve, which in turn we define as the expected proportion of seats, given the average district vote. (These definitions were first given in Gelman and King 1990 and King and Gelman 1991 and are based on King and Browning 1987 and King 1989.) A large literature on the seats-votes curve has accumulated over the past half-century, and several methods have been applied to estimate the function of seats, given votes (or, more precisely, expected seats, given votes). One approach, which uses minimal modeling assumptions, is to estimate the seatsvotes curve by a regression of aggregate results from several election years; see, e.g., Tufte 1973). This approach suffers from inefficiency (using aggregate, not district-level, vote information) and, more importantly, cannot be used to measure year-to-year changes, such as we are interested in here. The other traditional approach to estimating the seats-votes curve has been based on the model of "uniform partisan swing" (see, e.g., Butler 1951), a deterministic model that, without modification, applies to no

known electoral system.

Our method can be seen as a generalization of uniform partisan swing, with two major improvements. First, we model variability in district election outcomes beyond a uniform statewide swing, thus making the model far more realistic. Second, we include explanatory variables to improve predictions, thus harnessing the full power of regression modeling for district-level data. We also verified each of these assumptions in extensive analyses of all available data on state legislative and congressional elections. We here use past election results, uncontested status, the party of the winner in the previous election, and incumbency as explanatory variables. In addition, we treat uncontested elections in a special way (see Gelman and King 1994).

Although our model applies to any electoral system with two parties or groups of parties, we use the labels "Democratic" and "Republican" to fix ideas more clearly. We assume a legislature comprising nsingle-member districts and denote v_i as the Democratic proportion of the two-party vote in each district i and v as the set of votes for all districts (v_1, v_2, \ldots, v_n) v_n). The votes v will be predicted by k explanatory variables, which can together be written as $n \times k$ matrix, X. We model the district vote outcomes with a random components linear regression of v on X, v = $X\beta + \gamma + \epsilon$, where β is a vector of k parameters that we estimate from each state election, and γ and ϵ are two vectors of independent error terms. The variable ϵ is a traditional random error term; γ is the "random component" error term, which helps correct for the fact that the X variables do not completely describe the state of the electoral system at the start of the

campaign due to the omission of relevant variables and measurement error in the variables included. For each district i, the error terms are assigned independent normal distributions, $\gamma_i \sim N(0, \sigma_\gamma^2)$, $\epsilon_i \sim N(0, \sigma_\epsilon^2)$, with variances σ_γ^2 and σ_ϵ^2 that we estimate from several years of election data for each state.

The parameters of this model to be estimated— σ_{γ}^2 , σ_{ϵ}^2 , and β —are not usually of primary interest in evaluating electoral systems and redistricting plans (although β is in some cases of interest in evaluating causal effects). Instead, we define theoretically all the quantities of interest, including the seats—votes curve, responsiveness, and partisan bias, and then compute posterior distributions of all these quantities using Bayesian simulation. The estimates and standard errors of responsiveness and partisan bias used in this study are just the posterior mean and standard deviation of these quantities, estimated separately for each state election.

APPENDIX B: ESTIMATES OF BIAS AND RESPONSIVENESS FOR STATE ELECTIONS

The posterior mean estimates, along with redistricting information, are presented in Table B-1. Posterior standard deviations, as well as the district-level data upon which the estimates were based, are available from the Inter-University Consortium for Political and Social Research in a Class V data set under the authors' names, or from the authors.

Note: Electoral responsiveness and partisan bias are estimates computed using the Judgelt program, as outlined in Appendix A. Responsiveness is the expected change in Democratic proportion of seats per change in average Democratic proportion of votes in a state; for example, a responsiveness of 2 means that a swing of 1% in average district vote will cause (on average) a 2% swing in seats. Bias is the expected average difference between the Democratic and Republican proportions of seats when their proportions of the vote range from .45 to .55; for example, a -2% bias roughly corresponds to the Democrats receiving 48% of the seats from 50% of the vote. In our main analysis, we only use the bias figures for states with competitive elections, as discussed in the text.

Notes

We thank Ken Benoit and Mike Ting for research assistance; Jim Alt, Bruce Cain, Normal Luttbeg, and Michael McDonald for helpful comments; and the National Science Foundation for research grant SBR-9223637. Gary King also thanks Nuffield College, Oxford University, for a visiting fellowship; the John Simon Guggenheim Memorial Foundation for a fellowship; and the National Science Foundation for research grant SBR-9321212. All data and information necessary to replicate the results in this article are available from the Inter-University Consortium for Political and Social Research in a Class V data set listed under our names. The computer program we used for this work is called JudgeIt and is available from the authors, the ICSPR, or on the Internet via "gopher" or "anonymous FTP" from haavelmo.harvard.edu.

1. We learned of this story from telephone interviews with justices, politicians, and civil servants in Michigan, while collecting our data.

2. In private conversations with us, members of Congress often volunteer their strong support for increasing the size of Congress so that no state would lose a member at redistricting time. However, they also believe that such a proposal would not stand a chance of passing because it seems so self-serving.

3. For example, we observed several white Democratic legislators in one state succeed in drawing many black voters out of their districts. Because blacks vote overwhelming for the Democrats, this action reduced these legislators' likely general election vote margins, if they got to the general election. However, since voters often prefer to be represented by others from their ethnic group, these new district lines may have increased these white legislators' probabilities of winning or avoiding a primary election.

4. During the redistricting process in one state, we spoke to an incumbent whose new district would have probably given him about 75% of the vote, almost exactly what he had before the redistricting. Yet he went to great extents to oppose the new plan because the opposition party, which controlled the redistricting, had, as he said, "ruined his life." It previously took him under an hour to drive to anywhere in his district, but the new district would be stretched almost all the way across the state. In addition, all four of his district offices and even his childrens' schools were drawn out of the district.

5. Even trying to improve their party's chance of winning a majority of seats is in the narrow self-interest of incumbent legislators, since majority party members in most states have more staff, are chairs of committees, gain additional visibility, and are better able to accomplish their policy goals and satisfy their constituents. As one legislator explained it to us, being in the majority party is also "a lot more fun."

6. We have applied the methods described herein to other measures of electoral competitiveness and found only trivial substantive differences from the results reported in the text

using our responsiveness measure.

7. We have checked a sample of these ICPSR data with our own data coded directly from the blue books published by several state governments. We found a few errors (and reported them to the ICPSR), but overall these data are remarkably clean and far more reliable than, for example, the ICPSR collections of U.S. House and Senate data.

8. We do not distinguish between bipartisan and nonpartisan redistricting plans. In most states, it is difficult or impossible to do so. Some previous analyses also used a separate category for court-imposed plans, but many courts (especially state courts) are widely known to be very partisan.

9. Errors in this variable, if any, are almost certainly unrelated to other variables in our analysis.

10. We studied the effects of differential turnout across districts on our estimates by repeating all analyses after substituting the statewide vote for the two parties (i.e., the total votes for the Democratic candidates cast statewide as a proportion of major party votes) in place of the average district vote, \bar{v} . (For a discussion of the role of turnout in these two definitions of statewide vote, see Ansolabehere, Brady,

and Fiorina 1988.) Although the levels and patterns of responsiveness and bias did change in some states, the effects of redistricting on these quantities were not materially different from those based on v. That is, in the ensuing analyses, Figures 1 and 2 changed in some ways, but Figures 4-7 (and Tables 1 and 2) changed in only substantively trivial ways.

11. Using average electoral responsiveness measured at \bar{v} between .45 and .55 (see Gelman and King 1994) gives very similar results when applied to the present analysis.

12. We also analyzed responsiveness for these subsets of data and found no relevant changes.

13. To maintain comparability, each point on the figure is averaged over only those 17 states that are in our data set for all 20 years.

14. Subtracting the mean from the dependent variable does not affect any substantive results, but it allows the coefficients of redistricting to be interpreted as effects for the average case.

15. The specific codes we use to represent the dummy variables make interpretation convenient but are not otherwise required or consequential.

16. To improve the estimation, we use weighted least squares with the estimated standard error of each observation (our estimated value for responsiveness), pooled within each state, to compute the weight. This is a standard procedure in general and in this literature (see King 1991; King and Browning 1987)

17. The random-effects model altered the regression results in three ways: (1) most of the standard errors decreased slightly, (2) the estimated state effects decreased, and (3) the estimated coefficients of the lagged variables increased. All these changes could be considered as improvements in the model fit, and all are consistent with the theory of randomeffects models. However, we used the simpler linear regression model, because the estimated causal effects of interest did not change materially.

18. Another way to interpret equation 1 is by noting that the effect of R_{it} (redistricting) on Y_{it} (responsiveness or bias) is $(\beta_1 + \beta_2 Y_{i,t-1})$, or, equivalently, the effect of $Y_{i,t-1}$ (last election's responsiveness or bias) on Y_{it} is $(\beta_4 + \beta_2 R_{it})$.

19. Equation 1 is a form of an AR(1) time series model. Conditional on the first lag, which is estimated, the model implies a geometric decline in the coefficients for subsequent lags. To evaluate this assumption, we estimated separate regressions with lags 1, 2, 3, and 4 of redistricting, omitting cases with intervening redistrictings. In all cases, we could not reject the assumption that the correlations followed the AR(1) pattern. For example, the theoretical and estimated lag coefficients for responsiveness are as follows:

Lags	Theoretical	Estimated (s.e.)
1	.40	.40 (.06)
2	.16	.15 (.08)
3	.06	.07 (.14)
4	.03	.22 (.33)

They decline as expected, consistent with the theoretical values based on the lag 1 coefficient of .40. (Note that the estimated coefficients at lags 3 and 4 are smaller than their standard errors.) Analysis of partisan bias gave similar results.

20. In the vast majority of states five elections, at most, are held under any redistricting plan. Since the estimated difference between the effects of bipartisan and partisan plans on responsiveness is small, we omit an analogous figures for partisan plans; it looks very similar to Figure 5.

21. Another way to look at this is with descriptive statistics: the average absolute value of bias in years following redistricting was .016, compared to an average absolute value of

.028 in nonredistricting years.

22. The biggest example of this-indeed, the largest effect of redistricting ever noted in the academic literature to our knowledge—is the Ohio State Legislature in 1972. See Figure 2 and the more detailed analyses in Gelman and King 1990.

23. We find no evidence of a difference between the aver-

age absolute size of an effect created by Democratic and Republican mapmakers.

24. We find little evidence that redistricting plans typically

have an effect by selective placement of nonvoters.

25. In addition, as noted, the causal inference for bias is especially reliable because lagged bias, unlike lagged seats and votes, does not correlate strongly with the type of redistricting.

26. The Supreme Court wrote in Voinovich v. Quilter (1993):

Time and again we have emphasized that "reapportionment is primarily the duty and responsibility of the State through its legislature or other body, rather than of a federal court." Growe v. Emison, 507 U.S. (1993), supra, (quoting Chapman v. Meier, 420 U.S. 1, 27 [1975]). Accord, Connor v. Finch, 431 U.S. 407, 414 (1977) ("We have repeatedly emphasized that 'legislative reapportionment is primarily a matter for legislative consideration and determina-tion' "[quoting Reynolds v. Sims, 377 U.S. 533, 586 [1964]].)

POWER AND INFLUENCE IN STATE LEGISLATIVE POLICYMAKING: THE INTERACTION OF GENDER AND POSITION IN COMMITTEE HEARING DEBATES

LYN KATHLENE Purdue University

here is an implicit assumption behind advocating for more minorities or women in elected office, namely, that these officials will bring a new power and influence to their underrepresented groups. However, for women, this idealized viewpoint ignores the social dynamics that subordinate women's words and actions even in "well-balanced" male and female group interactions. Using transcribed verbatim transcripts of 12 state legislative committee hearings, this research analyzes the conversational dynamics of committee members, witnesses, chairs, and sponsors. Sex differences among committee members are highly significant, even after accounting for political factors and structural features of the hearing. In addition, male and female chairs do not conduct hearings in the same way, and these differences affect the behavior of witnesses and committee members. The findings suggest that as the proportion of women increases in a legislative body, men become more verbally aggressive and controlling of the hearing. Women legislators may be seriously disadvantaged and unable to participate equally in legislative policymaking in committee hearings.

The entry of more and more women into the realm of legislative politics suggests that their L increased numbers will offer women equally increased opportunities to influence policymaking. Once a group reaches a certain size (a certain "critical mass"), then its position, power, and influence will increase dramatically. For example, scholars have theorized that through numerical gains, the negative effects of tokenism, which serve to marginalize women in an institution, will fade and that feminist women elected to office will no longer hide or subsume their agendas (Carroll 1985; Kanter 1977). Recent empirical research provides some evidence that women's proportional gains translate into policy gains, as women legislators are beginning to prioritize and pursue topics of special interest to women, such as family policies and women's rights (Reingold 1992; Saint-Germain 1989; Thomas 1989, 1991; Thomas and Welch 1991). Over time, women have moved into leadership positions, and early research in this area indicates that women appear to have a different leadership style than men (Dodson and Carroll 1991; Flammang 1985; Rosener 1990).

Women, even after their 1992 electoral gains, still remain a small minority in the U.S. Congress (10.8% in the House, 7% in the Senate). However, over the last 20 years, local- and state-level offices have proved more permeable for women. In 1993, state legislatures had an average of 20.4% women, ranging from a low of 4.3% in Kentucky to a high of 39.5% in the state of Washington (Center for the American Woman and Politics [hereafter CAWP] 1993a). Given the increasing importance of policymaking at the state level and the springboard effect and policy expertise that state legislative experience provides for many congressional members (Berkman 1993; Francis and Riddlesperger 1982), examining women's partic-

ipation in policymaking and leadership experiences at the state level provides a snapshot of their current and potential impact.

Of course, as many scholars have shown, state legislatures are not monolithic. Comparisons between one state and another are complicated by political culture, length of the session, salary compensation, staff resources, size of the chamber, number of standing committees, use of subcommittees, degree of party competition, and parliamentary rules-to name but a few important differences (Elazar 1972; Francis 1989; Hedlund 1984; Jewell 1962). Despite these complications, Jewell's (1982) comparative work on all 50 states and Francis's (1989) theoretical models of the states' committee systems provide a baseline for locating where a state fits within the U.S. federal system. But, perhaps more importantly, they have also located commonalities across the diverse set of legislative bodies. For example, Francis found that state legislators spent the majority of their time working with legislation, as opposed to constituency service or legislative oversight. Specifically, committee work and sponsorship were a legislator's main focus, with the former taking more time than the latter due to the greater number of bills that pass through committees and bill introduction deadlines that are set early in the session (Francis 1989; National Conference of State Legislators [hereafter NCSL] 1992; Straayer 1990), which have the practical effect of limiting the number of bills a legislator can prepare to sponsor.

Leadership and party-caucus power notwithstanding, the important decision-making role of standing committees (both full and subcommittees) has been recognized and tested by state and congressional scholars (for recent examples, see Evans 1991a; Francis 1989; Francis and Riddlesperger 1982; Hall 1987).

While structural and personal characteristics of an individual (e.g., leadership position, party affiliation, terms in the legislative chamber, policy goals, constituency concerns, desire to make good policy, and expertise or interest in a particular bill) have been considered important determinants of participation in committee hearings (see, esp. Hall 1987), the effect of a committee member's sex has been completely ignored. With the lack of women in Congress, it is not surprising (or necessarily disappointing) that gender is absent in these models. But even the recent work of state legislative scholars has failed to take into account the role of gender, despite a substantial presence of women in state legislatures over the last decade.

The presumption among these scholars must be that gender simply does not matter. Yet an extensive body of research on gender in a variety of disciplines (e.g., management, psychology, communication, linguistics, sociology, political science) has shown that women are not equally situated with men or adequately captured through models built upon male behavior (see, e.g., Gilligan 1982; Guy 1992; Kanter 1977; Kathlene 1989; Ragins and Sundstrom 1989). Women, whether they be 10%, 20%, or 60% of an organization, work within the larger confines of gendered institutions and socially prescribed roles (Guy and Duerst-Lahti 1992; Zimmer 1988). As Janice Yoder (1991) shows, simply increasing women's presence in the workplace to combat the negative effects of tokenism and bring about gender equality ignores the pervasive sexism in society. Yoder reports that studies on tokenism have found that token men do not experience the same negative consequences as token women (i.e., sexism, rather then group size, produces inequities) and that highly masculinized occupations become more, not less, resistant to rapidly increasing numbers of women, a phenomenon Yoder labels the "intrusiveness" effect.

Yoder's assessment in itself has serious implications for women in politics generally and legislative committee studies specifically. Few social and occupational domains are more masculinized than politics. One does not need a thorough review of American history to recognize that elected offices have belonged almost solely to men (especially at the state and national levels) until just very recently—the last 20 or so years. While on one hand we may bemoan that women are making slow (but steady) increases in state legislatures (less than a 1% gain per year), women's pace, historically understood, could be classified as rapid and "intrusive" in a highly masculinized institution (women's presence in state legislatures has increased fivefold since 1969; see CAWP 1993b). If individual power and influence over policymaking occurs mainly in committees (Francis and Riddlesperger 1982; Hall 1987), women may face additional social barriers not considered within existing models of legislative committee behavior.

In the legislative setting, individuals (and therefore groups) obtain influence primarily through two methods: (1) appointments to powerful positions and (2) assignments to and participation in committees.

Theoretically, in a gender-neutral institution, all committee chairs have the power to set the agenda and guide committee discussions. If women have more of an interest in certain types of issues, as research on their legislative priorities and sponsorship of bills indicates (Saint-Germain 1989; Thomas and Welch 1991), then, in an equitable setting, female committee chairs would have opportunities to imprint their concerns while directing hearings. Similarly, if committees are composed of some critical mass of women, then the effects of tokenism and marginalization should be eliminated, allowing women to join freely in the debate on bills. Yet Yoder's work suggests that women chairs will not receive the same respect or have the same influence over committee hearings as men; and the more feminized a committee becomes, the more overt hostility will be directed at women by men.

But it is even more complicated than Yoder's work implies. Other research has found that women do not use or perceive their positions of power like their male counterparts (Blair and Stanley 1991; Dodson and Carroll 1991; Duerst-Lahti and Johnson 1990). Eagly and Johnson's (1990) metaanalysis of experimental and organization research on gender and leadership style found that women tended to lead more democratically, while men tended to be more autocratic. Similar results were found in a legislative setting, where women chairs were more likely to use their position as a facilitator or moderator of committee discussion, rather than as a way to control witness testimony, direct committee discussion, and join in the substantive debates (Kathlene 1990, 1991). Yet it is the latter approaches that are associated with the notion of positional power. That women do not use the position in the same way brings up two important questions: (1) Will gaining access to "powerful" positions result in truly equal influence? and (2) If women use their positions differently, is this due to men's negative reaction to women in power or women's freely chosen redefinition of power?

Finally, with regard to rank-and-file committee members, theoretical and empirical research previously discussed strongly indicates that women and men will not be "equal" participants in group discussions. Therefore, electing more women to legislatures will not automatically change the power balance or the influence in policymaking. Gender, as described and applied in this literature, is a complex and interacting construct representing struggles over the use and definition of power, methods of managing conflict and building consensus, paths toward implementing change, and resistance by supporters of the status quo. Gender, like class, is a fundamental category of political analysis, not simply another independent variable representing biological sex (Silverberg 1990).

This research attempts to discover where the barriers—and when the imbalances—occur in one important decision-making setting: the committee hearing. While it is possible that men always dominate verbal interactions in mixed-sex groups, other re-

search indicates that the dynamics of dominance are more complex. Such factors as the positional power of speakers plays an important role in gendered verbal behavior, and it appears that there may be important power and influence differences depending on the topic (or issue) being discussed (Craig and Pitts 1990; Kathlene 1991). Documenting precisely whether and when women are effectively kept out of committee hearing debates and under what circumstances women are successful is important for understanding how the status quo resists change despite numerical gains in elected women representatives.

RESEARCH DESIGN AND METHODOLOGY

All the data were collected from the 1989 Colorado State House during the regular legislative session. Although it was not a full-time legislature, Berkman (1993) ranked the Colorado legislature during the mid-1980s as "more professionalized" (thirteenth of 50) based on its relatively long annual session, legislators' compensation, staff size, and control over federal grants (see also Francis 1989; Jewell 1982).

Four institutional features made Colorado a good choice for examining legislators' verbal interactions in committee hearings. First, while Colorado tends to lean Republican, it has a competitive two-party system thereby making partisan comparisons meaningful (Francis 1989; Jewell 1962). In 1989, Republicans controlled both legislative chambers, 60% of the House, and 69% of the Senate, while the governor's office was Democratic. Second, legislative power is not monopolized; rather, it is shared among the majority party caucus, leadership, and standing committees (Francis 1989). However, Francis also found that legislators in Colorado both preferred and believed that standing committees were the locus of decision making for most bills, with the majority party caucus only taking an active role on bills that reached the House floor. And as of the 1989 session, leadership and caucus power were significantly decreased by the citizens of Colorado through the passage of an amendment the previous November. Dubbed GAVEL for "Give A Vote to Every Legislator," the amendment prevented (1) pocket vetoes by the speaker and committee chairs and (2) binding caucus votes. GAVEL lessened the chair's control to set the committee agenda by forcing all bills through the committee process (Lorch 1991; Straayer 1990). Building coalitions and guiding committee and witness discussions were the main avenues of control left for committee chairs. Theoretically, chairs have the ability effectively to kill bills even since GAVEL by scheduling them late in the session. However, in 1989, only a handful of bills died due to expired deadlines. Relatedly, parliamentary rules regarding speaking behavior (such as time limits, turn limits, or seniority privilege) did not exist for committee hearings.2

Rather, each chair determined the degree of formality that would be followed (Lorch 1991).

Third, Colorado's relatively small legislative body (n = 65 in the House), the restriction on the number of bills a legislator can introduce in a session, and bill introduction deadlines has helped thwart the pressure to create subcommittees (Francis and Riddlesperger 1982; NCSL 1992; Straayer 1990), thereby increasing the importance of standing committees in policymaking. Fourth, in 1989, Colorado House representatives were assigned to an average of 1.72 standing committees, well within state legislators' "satisfaction threshold" (n \leq 3) for the optimal number of committee assignments (Francis 1989). With fewer committee assignments, individual legislators are more likely to have studied the bills assigned to their committee, conversed with their committee colleagues about the legislation, and attended most of their committee's hearings; that is, legislators' scheduling conflicts are reduced with fewer committee assignments (see Francis and Riddlesperger 1982). Under these conditions, rank-and-file committee members should be more active in committee policymaking and less reliant on the chair.

All these conditions point to the importance of standing committees in Colorado state policymaking. Indeed, in the House during the 1989 session, first committee hearings proved to be crucial to the final outcome of the bill. Nearly three-quarters (n=196) of all House bills that passed out of the first committee (n=274) eventually became law. Similarly, of the 164 House bills that were killed in 1989, over 50% (n=86) died in the first House committee hearing, with the remaining bills slowly dropping out at each subsequent stage of the process.³

The Colorado legislature has long been among the states with the highest proportion of elected women. During 1989, Colorado ranked fifth among the 50 states in the number of women elected to state government, with 33% (n = 22 out of 65) seated in the House and 20% (n = 7 out of 35) in the Senate (CAWP 1989). For testing gender differences in participation rates at committee hearings, the House committees provided a variety of sex compositions. The percentage of women assigned to standing committees ranged from a low of 9% on the powerful State Affairs Committee to a high of 55% on the Education Committee. Two of the 10 committees of reference were chaired by females; 6 committees had female vicechairs. Both committees chaired by females also had a female vice-chair. All committees were proportionally representative of the legislature's party distribution, with the committee chairs and vice-chairs selected from the majority Republican party.

Sample Selection of Hearings

Twelve committee hearings were selected from the 68 taped and transcribed hearings gathered. I was interested in selecting a group of bills that were likely to bring out women's voices. All eight family/children bills that were sampled during the 1989 session were

selected for this analysis based on the presumption that women were likely to engage in discussions about family and children issues since other research has found that women are more likely to prioritize and sponsor these issues (Saint-Germain 1989; Thomas 1994; Thomas and Welch 1991). Four other nonfamily bills selected on the basis of hearing and sponsor characteristics comparable to the family/children bills (i.e., sponsor's sex, chair's sex, the proportion of women on the committee, and the first committee assigned to the bill) provide for a comparison between family and nonfamily bills.

Half of the bills were sponsored by a female; 5 of the 12 hearings were chaired by a female. It was not unusual for the vice-chair to direct the hearing or to cochair the hearing. Four of the selected hearings were chaired by more than one person. In these hearings, it was the male chair (rather than the female vice-chair) who predominated over most of the hearing (80% or more); therefore, these hearings are coded as male-chaired. The percentage of female legislators at the hearing, including the chair and the sponsor, ranged from 12% to 64%. Eight of the 12 bills passed out of their first committee (the hearing under study in this analysis). Ultimately 5 of the 12

bills became law. Table 1 lists the characteristics for each of the hearings analyzed.

Descriptive Statistics of Sample

The 12 hearings represent a total of 13.2 hours of committee discussion, with a mean length of 66.2 minutes, ranging from 26 to 138 minutes. The 12 hearings have a total of 204 speakers acting in one of four positions during the hearing (e.g., sponsor, chair, committee member, witness). Sixty-five percent of the House members (42 out of 65) were represented in one or more of the six hearings. Thirty-three percent of the selected legislators were in their first term, with 2.5 being the average number of terms in office, and there were no sex differences. The average age of the legislators was 47.0 years, but this differed significantly by sex (t = 3.69, p = .000), with men having a younger average age (mean = 44.2 years) than women (mean = 50.7 years). Sixty-five percent were Republicans (committee members and chairs combined), representing the party distribution in 1989. Two-thirds of the sponsors in this sample of bills were Republicans, which is similar to the sponsorship by party for all bills introduced in the 1989

[&]quot;The percent female at the hearing includes all legislators (committee members, sponsor, chair). The variation shown within the same committee reflects one or more of the following changeable conditions: (1) one or more legislators assigned to the committee did not attend the hearing, (2) the sponsor could be a man or a woman, and (3) the chair of a committee could be either a man or a woman, since chairs and vice-chairs directed hearings.

House. Overall, the sample is representative of both the bills and the legislators across many important characteristics.

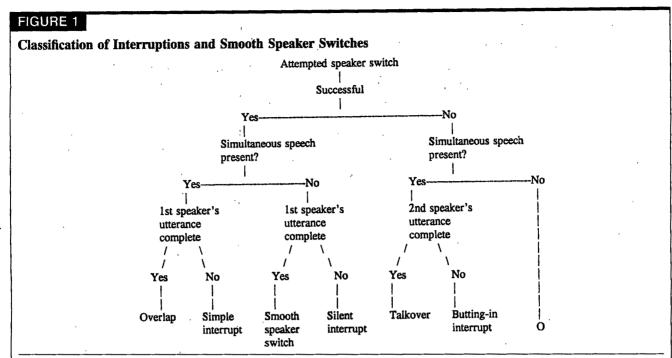

Dependent Variables

To determine "who holds the floor" in legislative committee hearings, five dependent variables were tested. The first measure, percent TIME ELAPSED, is the percentage of the hearing that has elapsed when the speaker first talks,5 calculated by dividing the number of words spoken at the hearing prior to a speaker's first utterance by the total number of words spoken at the hearing. The point in the hearing when a speaker enters the committee discussion may be an important measure of influence. Earlier comments and/or questions may direct the other committee members to consider the bill based on the concerns of early speakers. In addition, speaking up early in the hearing may influence subsequent witnesses to modify their testimony in order to address the apparent concerns of the committee at the possible expense of emphasizing other important points. Of course, amendments created in committee (as opposed to sponsor amendments brought to the committee to address perceived deficiencies in the drafted bill)6 result from discussions in the hearing so that early engagement in committee discussion is likely to both guide further discussions and result in a permanent change of the proposed legislation in the form of amendments.

The second two dependent variables, words spo-KEN and TURNS TAKEN, are discrepancy score measures that subtract the expected frequency (the sum of the speaking behavior divided by the number of people present at the hearing) from the actual frequency of a particular speaking behavior. The discrepancy score standardizes for differences in the length of the hearing time to make interhearing speaking behavior comparable. Words spoken measures the time a speaker holds the floor. This is an indicator of how vocal a person was during the hearing. Research outside of political settings has found that men talk more than women, whether in mixed- or same-sex groups (Wood 1966). Other studies have documented that males are the more talkative in mixed-sex conversations in the workplace, classroom, and in couple situations (see, e.g., Bernard 1972; Craig and Pitts 1990; Fishman 1978; Swacker 1975; Swann 1988; Woods 1988), and that males talk longer in monologue-type situations (Edelsky 1981). Turns taken measures how often speakers initiated and engaged in discussion. This is an indicator of how actively involved a person was in the hearing.7 The interpretation of activity will vary depending upon the positional role of the speakers. When committee members take many turns, it reflects their self-initiation. However, when witnesses take many turns, it reflects the engagement of the legislators (chair, committee members, and, to a lesser extent, the sponsor) through questioning the witness.

The final two dependent variables, percent INTER-RUPTIONS MADE and percent INTERRUPTIONS RECEIVED, measure the different ways committee members gain and lose their speaking turns. Most turns, even in less formal settings than a committee hearing, are gained through "smooth speaker switches," where a person waits until the speaker has completed their utterance. How a person gains their speaking turn is an important indicator of both social norms (i.e., politeness) and power or dominance. Numerous linguistic and sociological studies of mixed-sex group dynamics document the male's verbal aggressiveness. For example, one study found that males interrupting females accounted for 96% of all interruptions (Zimmerman and West 1975). Another study found that men were more likely to talk while a woman was speaking than while a man was speaking (Willis and Williams 1976), though the context and situation of the verbal interaction are important determinants that can reverse the pattern (Murray and Covelli 1988). Interrupting another person reflects the speaker's position of power and dominance, whether it be social or institutionally derived (West and Zimmerman 1977). In committee hearings, there are potentially two conflicting conditions regarding power and dominance. Research on sex differences suggests that men will do a disproportionate amount of interrupting and that women will be interrupted more often than men. But positional power (e.g., chairing the hearing) should mitigate the socially constructed power differences between the sexes. Women chairing committees should not act differently from their male counterparts—or at least, they should be more dominant (i.e., do more interrupting) than either rank-and-file committee members or witnesses (see Kollock, Blumstein, and Schwartz 1985).

An interruption can be successful or unsuccessful. Following Craig and Pitts' (1990) coding scheme, five types of interruptions were identified. Figure 1 diagrams how speaker switches were coded. The five dependent variables examine verbal behavior of legislators and witnesses in committee hearings. While the measures are naturally related to each other (e.g., we would expect that speaking early in the hearing would be positively correlated with speaking more in the hearing), it is the variation among the independent variables that expose the conversational dynamics of a hearing. For example, based on literature previously discussed, men and women may take an equal number of turns, but men may talk longer than women in any given turn. Similarly, interruptions will be related to how much a person talks simply because there is more time to interrupt the person, yet we would expect chairs to make more—but receive less—interruptions by virtue of their position of control. Most of the dependent variables used in this analysis are only moderately correlated (.25 to .50), and all covary in the expected direction. (See Appendix Table A-1.)

Source: Craig and Pitts 1990, 129, based on G. W. Beattie. 1983. Talk: An Analysis of Speech and Non-Verbal Behavior in Conversation. Milton Keynes: Open University Press.

Note: Only smooth speaker switches represent taking a turn without interrupting the speaker. Both interruption variables were created by summing together all successful and unsuccessful interruptions (Overlap + Simple Interrupt + Silent Interrupt + Talkover + Butting in) that a speaker made or received. The individual sums were then divided by the total number of turns taken in the hearing to produce percentage scores. While there are theoretically important differences in the type of interruption made, there are too few observations in the data set to analyze the five types separately.

RESULTS

Descriptive Statistics

A total of 116,051 words were spoken with a mean of 9,671 words per hearing. Across all 12 hearings there were 1,747 smooth speakers switches and 195 interruptions. Total interruptions ranged between 4.0% to 26.0% of all speaker switches, with an average of 11.2%. The interruption rate is low in comparison to research findings in conversational dynamics (see Craig and Pitts 1990). No doubt this was due to the formality of the setting. Parliamentary procedures both produce more speaker switches (the chair constantly acknowledges each speaker-55.1 percent of all turns were taken by chairs) and lessen the likelihood of interruptions (speakers generally wait to be acknowledged by the chair). Similar to findings in conversational analysis, most interruptions during the hearings resulted in a successful turn (86.2%) for the person who did the interrupting, further validating the importance of studying who interrupts whom.

Positional Role

Position at the hearing is an important determinate of speaking behavior. Three multivariate regression models of the five dependent variables that demonstrate the power of positional role and speaking behavior are shown in Table 2. In the first model, chairs, committee members, and witnesses all differed significantly from sponsors on the five dependent

dent measures. Chairs took the most turns speaking, while sponsors dominated hearings in speaking time. Sponsors and chairs both made and received more interruptions than committee members or witnesses. The significant differences in elapsed time among the roles are an institutional artifact: sponsors always had the opportunity to summarize their bill verbally at the start of committee hearings; chairs spoke next by virtue of their role as moderator of the hearing; witnesses and committee members were the last to enter into the committee discussion.

The second model adds sex to the equation. The positional patterns found in the first model remain essentially the same. In addition, except for interruptions received, men and women at the hearing also differed significantly from one another. Women entered the discussion later, spoke less, took fewer turns, and made fewer interruptions than men.

The third model includes interaction variables of sex by position. Overall, position continues to distinguish among different speaking behaviors, and female chairs are significantly different than male chairs. Women chairing committees spoke less, took fewer turns, and made fewer interruptions than their male counterparts, suggesting that men and women have different leadership styles. The same gendered pattern holds for female committee members and female witnesses in comparison to their male counterparts, although these differences are not statistically significant.

Since positional role is highly significant, in statis-

tical terms as well as substantive terms, the analysis will compare speaking behavior within each positional role across all 12 hearings.

Committee Members

Personal and Institutional Factors. A look at which group of legislators "hold the floor" in committee hearings most closely mirrors the environment found in linguistic research on conversational dynamics. While there are clear and important differences between informal groups (a group of friends, a set of couples, etc.) and the formality of a public hearing with its political constraints, the committee member plays the most "natural" role of the four types of participants studied in this research. Committee members are relatively free to engage in discussion at any point in time-unlike the witnesses who must wait for their initial turn and subsequent requests for comments. Unlike the sponsor, committee members

are not necessarily advocates of a particular bill, although they may be strongly aligned with a particular issue area. Rather than "campaigning" for the bill (as the sponsor does), the committee members' task is to examine the proposed legislation from a multitude of perspectives—personal, professional, and political—that they bring with them. In this way, committee members have the freedom to act more like individuals in a conversation than the witnesses (who are "outsiders" or merely "guests" at the legislative table), the sponsor (whose self-interest is tightly bound to the passage of the bill), or the chair (whose primary formal responsibility is to direct and coordinate the hearing).

Thomas and Welch's (1991) study of legislative activity found that men and women reported similar levels of participation in committee hearings. However, given the research discussed earlier on mixedsex conversational dynamics, we would expect gender differences between committee members, with

men dominating the hearing. Unlike an informal conversation among friends, there are several political and institutional factors that could produce differentiated patterns beyond or instead of gender. Partisan differences seem very likely. We might expect that the minority party (in this case, the Democrats) to be less vocal than the majority Republican party. Or minority party members may be particularly active in committee hearings in order to vocalize their objections to or imprint their concerns on the bill before it reaches the highly partisan dynamics of the House floor debates (Francis 1989; Hall 1987). Or there may be no discernible party differences since committees are viewed by the legislators themselves as one of the least partisan arenas in the legislature (Francis and Riddlesperger 1982).

Other factors could also be important. Hall (1987) found that Congress members' desire to make an imprint on a piece of legislation was strongly related to their participation in committee hearings. Having a personal interest or expertise in the issue area of the bill could explain differences in verbal behavior. Four measures were used to determine a legislator's interest in a bill. A legislator was considered "interested" if (1) the specific bill was mentioned in the personal interview as one of the most important in the session, (2) the issue area of the bill was mentioned among the legislator's top priorities, (3) the legislator sponsored or cosponsored a related bill during the 1989 session, or (4) the legislator's professional experience (e.g., profession, task-force work, community awards) was directly related to the issue area of the bill. Interest in the bill should increase a legislator's activity in the committee hearing.

Finally, legislative expertise may account for greater participation. The number of terms served in the legislature can be used as a general measure of legislative expertise. We would expect newly elected legislators to be inexperienced in state legislative policymaking at a number of different levels (e.g., parliamentary procedures, historical detailed knowledge about failed bills in previous years, and general insider politics) and lack the clout to be included in important off-the-record dealings with legislative leaders, state bureaucrats, and lobbyists. Because the first-term legislators in this research were in the first 60 days of their two-year term, the differences in speaking behavior between the newest members and more seasoned legislators might be very pronounced.8 Hall (1987) found that freshman status was negatively related to participation in congressional policymaking, and the same may hold true in state legislative committee hearings.

Results of Personal and Institutional Models. Table 3 reports (1) the bivariate regression results of sex on each of the dependent variables and (2) three multivariate regression models. As the bivariate model shows, sex is highly significant on all five measures of speaking behavior. Women, on average, waited until more than two-thirds of the hearing was over before they uttered their first words, while men engaged

halfway through the hearing. Men spoke longer and took more turns, and men made and received more interruptions than women committee members. The first multivariate model results indicate that sex continues to be significant across the five measures even after accounting for committee members' interest in the bill, their party affiliation, and their freshman status. In each of the measures, it was the male committee members who dominated the committee hearings.

Other variables are also important in understanding verbal behavior. As predicted, committee members who had an interest in the bill spoke longer and engaged in discussion more frequently. They were also interrupted more often, which follows from their greater verbal activity. Except for making fewer interruptions, minority party status did not affect speaking behavior in committee hearings, supporting Francis's (1989) interviews with state legislators, who reported low levels of partisan politics in committee hearings. Unlike Hall's (1987) findings on congressional representatives, freshman status did not lessen their participation in the hearings. Evans (1991a) found that newcomers to the Senate participated equally with their more senior colleagues, suggesting that there are circumstances that produce greater and lesser inequality based on tenure. Perhaps being a newcomer is more of a disadvantage in a large legislative body, such as the House of Representatives, than in a smaller chamber, such as the Colorado State House (see Evans 1991b).

Additional Committee Hearing Factors and Interactions. Based on recent research on women's legislative priorities and activities (Reingold 1992; Saint-Germain 1989; Thomas 1991; Thomas and Welch 1991), women may be more active participants in hearings that address family issues. If women have a special interest in certain types of legislation, due to their personal experience or belief that they can represent women's interests better than men (Reingold 1992), then female committee members should be more vocal in hearings on family issues.

The sex of the sponsor may have an effect on the committee members' speaking behavior. If women are bringing different views and values to policymaking based on a more needs-based, rather than individual-rights, orientation toward society (Dodson 1991; Dodson and Carroll 1991; Gilligan 1982; Kathlene 1991), then the bills that women sponsor, regardless of issue area, may embody this difference and perhaps strike a responsive cord among the other women committee members.

Chairing a committee is an important position of power because the chair can control much of the hearing dynamics, including in what order committee members will be recognized to speak, which committee members' ideas will be encouraged or cut off, and whether the bill will receive a final committee vote or be tabled (usually resulting in the death of the bill). Given findings in all-female groups that women engage in supportive and cooperative, rather than

^{*}Percent time elapsed measures the percentage of the hearing that has elapsed when the speaker first talks. Smaller percentages indicate early engagement

competitive, linguistic strategies (Coates 1988), female committee members may be more at ease or more inclined to speak when the chair of the committee is also female. However, other research indicates that even when a token male (or female) is present, the group dynamics change toward a less supportive interaction style (Smith-Lovin and Brody 1989). Therefore, the presence of a female chair may not be

in committee discussion.

bWords spoken and turns taken are discrepancy scores computed as expected frequency minus actual frequency. Negative numbers reflect less activity, positive numbers reflect more activity than average. Words spoken measures the time a speaker holds the floor, turns taken, how often a speaker initiates

and engages in discussion.

Conterruptions made and interruptions received are calculated by summing together the number of all the types of interruptions a speaker made (or received)

divided by the total number of turns in the hearing. See Figure 1 for a diagram and description of the coding scheme.

^aFemale mass represents the proportion of the committee hearing (committee members, sponsor, and chair) that is female. The variable was coded female tokenism = 1 (less than 30% female), female critical mass = 2 (30%-50% female), female majority = 3 (over 50% female).

 $p \le .15$. $p \le .10$. $p \le .05$. $p \le .05$.

enough to bring out female voices. Yet the more democratic leadership style of women—as opposed to men's more autocratic style—may provide the opportunity for more women to participate (see Eagly and Johnson 1990). But being democratic implies an inclusive style that should facilitate all voices, not just women's voices. Thus, men's more aggressive verbal behavior may be even more pronounced under a female chair. Based on these conflicting propositions, female committee members may participate more or less than men when the chair is female.

It may not be enough that the chair or the sponsor is female if the rest of the committee is comprised of mostly males. In order for women to be heard, they may need to comprise some minimal percentage in a committee hearing (Kanter 1977). Conversely, the increased presence of women may result in more verbal activity by men reacting to women's intrusion in the legislative setting (Yoder 1991). The 12 hearings were divided into three groups based on the percentage of women legislators at the hearing (including all the committee members, the sponsor, and the chair). Three bills comprise the female tokenism category, in which less than 30% of the legislators were women. Five bills are in the female critical mass, where 30% to 50% of the committee is comprised of women. Finally, four bills fall into the category of female majority, where, by definition, over 50% are women. If Kanter's proposition holds, female committee members will become more verbally active when more women are present. If Yoder is correct, female committee members will be less active due to men's stepped-up participation to counter the increased proportions of women at the hearing.

Results of Additional Considerations. As multivariate model 2 in Table 3 shows, after controlling for situational factors related to the hearing, the same pattern of male domination found in multivariate model 1 remains. Regardless of whether the chair or the sponsor is a man or a woman or the hearing is on a family issue, female committee members engage later, speak significantly fewer words, take significantly fewer turns, and make and receive fewer interruptions than their male counterparts. However, committee members speak significantly earlier as the proportion of women on the committee increases.

Model 3, which expands on model 2 by adding interaction terms of female committee members by each of the hearing variables, clarifies the differential effect of female presence and positional roles on male and female committee members' participation in the hearing. It is the men, rather than the women, who become significantly more vocal when women comprise greater proportions of the committee, supporting Yoder's "intrusiveness" effect. Similarly, male committee members engaged earlier—and female committee members, later—when the sponsor of the bill was a woman. An examination of the transcript reveals that male committee members asked questions of female sponsors immediately after their introduction and more male committee members en-

gaged early in questioning witnesses that testified for a female-sponsored bill, regardless of the proportion of women at the hearing. Both behaviors tended not to be present when a man sponsored a bill, suggesting that females (but not males) in positions of importance have their ideas scrutinized by rank-andfile men.

While the male committee members engage significantly earlier, they are not speaking or taking more turns under the different situational characteristics of the hearing. The same cannot be said for female committee members. Women not only engage later when there are more women at the hearing, but they also speak fewer words. And women, contrary to the expectation, speak significantly less than men at hearings addressing a family issue, even after controlling for interest in the issue area (which remains significant).

More generally, each of these models, while unable to explain a large proportion of the variance (model 3 explains between 16% and 21%), provide compelling evidence that sex is a powerful explanatory variable. Even when a particular variable is not statistically significant, the direction of the relationship is consistent with female committee members participating less under a variety of controls and interactions, while legislators with a personal or professional interest in the issue participate more.

Witnesses

An examination of witnesses' speaking behavior will help flesh out more of the committee hearing dynamics.

Factors Influencing Witness Speaking Behavior. As noted, witnesses have many constraints on their speaking behavior—most notably that they must wait for the chair to call them forward to speak. Therefore, gender differences in speaking behavior among witnesses may not reflect gender differences between the witnesses but rather differential treatment by the chair (who determines the order of testimony¹⁰ and has the power to limit testimony) and the committee members (who may ask questions of the witnesses). While partisan affiliation is not applicable (at least not determinable), age is unknown, and terms in the legislature cannot be used to measure expertise and political savvy of a witness, other possible factors may be important. Among the most important is the formal affiliation of the witness. Is the witness a lobbyist, a state bureaucrat, an "expert" in a particular field, or a citizen? To most legislators, lobbyists and bureaucrats are likely to be well known, respected, and mostly seen as reliable sources of information (Straayer 1990). However, the familiarity between these witnesses and the legislators may also bring out entrenched ideological differences that cause positive and negative reactions among the legislators. Individual lobbyists and bureaucrats should receive mixed opportunities to speak at the hearing, depending upon the composition of the

committee and the issue at hand. Experts may not be personally known by most of the legislators at the hearing, but by virtue of their professional title and experience (e.g., a doctor who specializes in high-risk obstetrics at a hearing on premature infants), experts (as a group) should be given the most opportunity to testify and answer questions. Citizens have no institutional or professional affiliation. Representing only themselves, they are likely to relay a personal story regarding aspects of the bill. Based on research findings that representatives rely on more professionalized sources of information to make policy and voting decisions, unaffiliated witnesses should be given the least opportunity to engage in the committee hearing (see Jewell 1982; Mooney 1991). There are other important characteristics of the witnesses that may cause legislators to treat them differentially. In Colorado, the sponsor of the bill orchestrates the witness testimony, especially in the first committee hearing. Speakers who come to testify at the request of a legislator should receive more opportunity to speak than witnesses who come forward on their own initiative. Relatedly, witnesses who testify in favor of the bill may be treated differently than those who are against it.

Male and female witnesses with different affiliations and roles may not be equally situated with regard to how committee members and chairs respond to them. For example, male experts may be seen as more credible than female experts. Interaction terms will disentangle these potential gendered effects. Finally, the same four hearing variables used to distinguish differences among committee members' verbal behavior are used in multivariate model 2 to test whether witnesses are treated differently under a variety of hearing circumstances related to gender. One additional hearing variable—the number of witnesses at the hearing—is included because the chair knows at the beginning of the hearing how many people have signed up to testify. Given a variety of time constraints the chair works within, the actual number of witnesses signed up for a bill may produce different speaking patterns imposed by the chair. Specifically, the more witnesses signed up, the less time each witness will be allowed to speak and the fewer questions the chair will allow committee members to ask.

Results of Witness Speaking Behavior. As Table 4 shows, the bivariate regression model that tests only sex is not significant for four of the five dependent measures. The chair does not have men and women witnesses come forward to testify earlier or later in the hearing based on their sex. While women witnesses speak less than the expected number of words and men speak more, these differences are not significant, indicting that male and female witnesses are given equal amounts of "floor time." There are no gender differences in the number of turns taken suggesting that committee members (and the chair) are as likely to ask follow-up questions from witnesses of either sex. Interruption patterns do vary by the witnesses' sex. Like their committee member counterparts, female witnesses are significantly less

likely to use interruptions to gain a speaking turn than are male witnesses. However, there are no sex differences with regard to witnesses' receiving interruptions, indicating that men and women witnesses are equally likely to be interrupted by the legislators.

Multivariate model 1, based on six witnesses' characteristics, produces several interesting patterns but sex is not significant for the same four dependent measures as found in the bivariate model. Witnesses who come forward on their own, rather than through the sponsor, speak significantly later in the hearing but speak as much—and take as many turns as—the sponsor's witnesses. As hypothesized, "experts" were given the most speaking time, as measured in words spoken and turns taken. Female witnesses continued to make significantly fewer interruptions than male witnesses after controlling for their institutional affiliation, sponsor affiliation, and position on the bill. Interestingly, witnesses who represented themselves made significantly more interruptions, indicating, perhaps, their lack of familiarity with the chair's moderator role.

Multivariate model 2, based on both interaction terms for the witnesses' characteristics and committee hearing characteristics, significantly improves the explained variance for the dependent measures. In hearings on family issues, witnesses spoke significantly earlier and made more interruptions. When the sponsor was a female, witnesses began speaking later in the hearing. This occurred for two reasons: female sponsors tended to give longer introductions to their bills (averaging 1,149 words, as compared to the 806 words for males) and, as noted previously, female sponsors received more questions from male chairs and male committee members during and after their introduction, rather than moving directly to the first witness. The latter interpretation is also borne out in the model where witnesses began speaking earlier in hearings chaired by a female (a woman chair tended to move directly to witness testimony) and were engaged later when there were more female legislators present. We saw earlier that male committee members became more verbally aggressive when more women were present and when the sponsor was a woman. A more extensive interaction model (not shown)11 found that under a female chair or when the hearing was on a family bill, it was the male witnesses who were making the interruptions, suggesting that increased verbal aggressiveness when women are in power and when women's traditional interests are being discussed is not limited to gendered dynamics among the legislators. Although the model measures witnesses' speaking behavior, these results tell us more about the interaction between witnesses and legislators and how male legislators treat female sponsors at the beginning of the hearing.

The interaction terms in multivariate model 2 produced some interesting gendered patterns that were absent in the main effects model. Overall, the direction of the relationships is consistent with the gendered pattern found among the committee members. Specifically, female witnesses who opposed a bill had

nesses took. While we might expect that citizens and witnesses opposed to bills would receive fewer opportunities to participate in the hearing, this is actually only the case for those who are women. Among the less "politically connected" witnesses, there appears to be a significant gender credibility gap.

However, there is a surprise, too. Female witnesses who testified on their own accord (rather than being asked by the sponsor) spoke earlier in the hearing than their male counterparts. These women also took more turns, made more interruptions, and received more interruptions, but they did not speak significantly more words than the men. The verbal patterns indicate that these women were persistent in trying to take the floor away from other speakers but were unable to hold it long enough to actually say more than the men.

Among the more politicized witnesses, male bureaucrats were asked more questions (they took more turns) but also received more interruptions. Female bureaucrats took significantly fewer turns and made and received fewer interruptions, indicating that they were asked far fewer follow-up questions by the legislators after their initial testimony.

Sex differences among the witnesses—as well as other sex differences related to the sponsor, chair, and percentage of female committee members—are present. However, these statistical measures miss other very distinctive treatments that male chairs used when addressing or acknowledging female witnesses. A woman who testified was usually addressed by her first name by male chairs, whether she was an unknown expert, citizen, familiar lobbyist, or bureaucrat; but a witness who was a man received a title in front of his name, both at the time of introduction and at the conclusion of his remarks. Female chairs used titles with both men and women who were unknown to them and reserved first names for witnesses of both sexes with whom they were familiar. 12 The most egregious example of this sexist treatment occurred in a hearing on a health issue, in which several doctors testified. Although the woman witness clearly stated her title and name as "Dr. Elisa Jones," 13 the male chair addressed her repeatedly as "Elisa" and finally thanked "Mrs. Jones" for her testimony. Needless to say, perhaps, none of the male doctors were referred to as anything but "Dr. ___.'

This all-too-familiar unconscious downgrading of women's authority and position in society, while not affecting the participation rate of female "expert" witnesses, may be providing another view of the sexist culture in committee hearings that permeates the participation rates for some female witnesses and most female committee members. Women experts may be given equal opportunity to speak, but one has to wonder if women's expert testimony is seen as equally credible with men's.

Chairs

In the first analysis of positional roles, we saw that men and women chairing hearings had different

TABLE 5

Total %	100.0	100.0		

Note: The percentages shown are the mean percentages for the chairs of each gender, based on 8 male chairs (who collectively took 391 turns) and 9 female chairs (who collectively took 338 turns).

speaking behaviors, with female chairs participating less-and interrupting less-than male chairs. In the analysis of witnesses and committee members' speaking behavior, we saw that under a male chair, the chair and his male colleagues on the committee questioned female sponsors early in the hearing. A slightly different approach to examining chair behavior can illuminate what these differences mean to committee members and witnesses. Since chairs play a central role in directing committee discussion, the type of turns taken by chairs were coded into one of three categories: Parliamentary turns were procedural turns, as when the chair calls a witness or recognizes a committee member who wanted to speak; clarifying turns request an affirmation from a previous speaker about the content or meaning of a statement; question/ opinion turns interject a new idea into the discussion. 14 Beyond taking the floor away from speakers, male chairs also influenced and controlled committee hearing discussions through engaging in substantive comments more than female chairs did. Table 5 examines the sex differences by type of turn.

Men and women chairs did not differ in their use of clarification questions. However, women were more likely to act as facilitators of the hearing, as evidenced through their almost exclusive use of procedural turns. And while men, too, used mostly procedural turns, in one out of six turns (on average), men interjected personal opinions or guided the committee members and witnesses to a topic of their interest. Men used their position of power to control hearings in ways that we commonly associate with the notion of positional power and leadership (see Jones 1989). Indeed, the earlier gendered patterns among committee members may be the interaction of women chairs acknowledging all voices (to be more inclusive) in conjunction with male committee members' more assertive verbal behavior (as evidenced in their interruption and speaking patterns) when there is a woman sponsor, a feminized hearing, or a family issue being considered. In other words, while the conversational terms of the game had been changed through different chair styles, the more dominant verbal behavior of men as committee members became accentuated in a hearing where the chair used a more democratic, less autocratic style (Eagly and Johnson 1990).

DISCUSSION

Although it is commonly believed that women's increased presence in state legislatures will lead to their greater power and influence in policymaking, this assertion has never been tested through observation. As an initial step toward empirically documenting these changes in women's political access to power, I examined their speaking behavior in legislative committee hearings. The findings reported here suggest that women legislators, despite their numerical and positional gains, may be seriously disadvantaged in committee hearings and unable to participate equally in legislative committee hearings. These findings are not actually surprising given our culture and the social construction of male power. Perhaps most disturbing are the results that substantiate Yoder's (1991) thesis of intrusiveness. Contrary to some scholarly expectations and legislators' selfreported behavior (Thomas and Welch 1991), the more women on a committee, the more silenced women became. It may be that women are particularly active in behind-the-scenes negotiations, but informal participation that alters a bill has to surface as formal participation in the form of amendments in committee or on the floor (Hall 1987).

Indeed, in the present research, there was a significant positive relationship between speaking and offering nontechnical amendments (t = $\bar{2}$.66, p = .02), with men dominating both. Participation and influence appear to be strongly related, but it may be premature to conclude that women's impact in policymaking is being undermined thoroughly. For example, in the current data set, the bills sponsored by men or women were equally likely to pass out of the first committee hearing (female $n = \hat{4}$, male n = 4) and become law (female n = 2, male n = 3). Even among all 360 bills introduced in the 1989 session of the Colorado House there were no statistically significant sex differences in traditional legislative outcome measures such as the final passage of the bill (female 52%, male 55%). However, traditional outcome measures such as passage rates are problematic, because they only capture final points in a complex policymaking process whose participants are neither politically, institutionally, nor socially equal. In attempting to assess women's impact (as chairs, sponsors, or committee members), such acontextual nonsubstantive measures can be seriously misleading. For example, other more sensitive process measures found that women-sponsored bills were significantly more likely to be assigned to more than one House committee (39%, as compared to 27%), were subjected to longer discussions in first committee hearings (averaging 67 minutes, as compared to 54 minutes), and received twice as much hostile witness testimony (12%, as opposed to 6%) (Kathlene, Clarke, and Fox 1991). Thus despite the appearance of equal treatment via the measure of equal success, the more contextual measures suggest that women were even more successful than men since women's bills had a more difficult passage through the legislature. Similarly, the current research demonstrating highly gendered conversational dynamics defies the sex balance in passage rates, indicating that women are able to get their legislation through the process even in the face of men's more vocal participation in committees.

How do we understand women's apparent passage-rate success in the context of such a process imbalance? Without a discourse analysis of the committee discussions, we can only speculate. But some of the gendered patterns may be tapping into differing legislative styles, including men and women's attitudinal approaches toward policy problems and solutions and leadership styles (Eagly and Johnson 1990; Kathlene 1991). However, it would be a mistake to interpret the social and institutional gendered patterns as merely reflections of individual gender differences with no cumulative effect on power and influence. Each gendered layer interacts and reinforces other layers in ways that can enhance existing power (Ragins and Sundstrom 1989), which may indeed thwart women's impact on policymaking. For if legislative bodies rely on committees to inform and guide policy decisions and these same committees are actually the locus of biased information (Jones, Baumgartner, and Talbert 1993), then when men control the policy debate early in the process their gender power will be enhanced within an institutional process that is already structured to "hear" and promote a myopic view of an issue. This has significance for all public policy but I would argue that it is particularly disconcerting for policy issues in which women have a special stake (e.g., women's rights, women's health concerns, and domestic violence). If male chairs have a propensity to interrupt speakers and choose the points to be discussed, women's issues will not receive a fair or (probably) informed hearing. If rank-and-file men are propelled to "take up" and "take away" the floor from rankand-file women when a female sponsors a bill or the issue heavily affects women, then women's imprint on the policy process will be undermined. The alternative-looking to women chairs as potential power brokers of women's interests—assumes either that their leadership style is similar to men's or that their "different" leadership style will have the same effect as men's on controlling debate in hearings. But there may be little reason, theoretically, to believe that a more democratic or inclusive style that women tend to use will produce the same control over the agenda as the more commonly used autocratic style of men.

Ultimately, to understand gender power differentials, we need to examine how the content of a bill changes as it passes through the process and look closely at who is influencing the changes. Is male verbal aggression directed at women-sponsored bills or women's issues resulting in a transformation of their bills that is disproportionately influenced by male voices? Or do women as chairs or committee members have ways (other than verbal participation in committees) to imprint their concerns on legisla-

tion as it moves through the process? For example, whether women's ideas raised in committee hearings are reflected in amendments sponsored by men become an important indirect measure to consider in future analyses.

Examining the speaking behaviors of legislators during committee hearings provides us with yet another view of how powerful gender is in our culture. Bringing more women into politics will not translate directly into a proportionate amount of female power and influence. In fact, there may be a powerful backlash present when women exceed a certain critical mass in a highly masculinized institution such as legislative politics (Yoder 1991). Yet it is clear that the presence of more women legislators will lead to more women sponsoring bills and chairing committees. When women chaired committees the dynamics of the hearing changed for witnesses and female sponsors in complex ways, some of which may provide for more democratic policymaking, particularly if the negative effects of increased verbal aggressiveness by men can be countered. This examination of speaking behavior only begins to tap into gender differences that may have profound substantive implications for legislative decision making.

APPENDIX

The Pearson correlations for the dependent variables in each analysis are presented in Table A-1.

Notes

An early version of this research was originally presented at the annual meeting of American Political Science Association, 1992, Chicago. The expanded model was originally presented at the annual meeting of the Western Political Science Association, 1993, Pasadena. The research was funded, in part, by the Center for the American Woman and Politics, a unit of the Eagleton Institute of Politics at Rutgers University, under a grant from the Revson Foundation, and the Purdue Research Foundation. I would like to thank Joseph Smith and Silvo Lenart for their discussions on measurement issues and Georgia Duerst-Lahti for her feedback on the normative implications.

1. Research on women in management supports these findings in the legislative setting (Rosener 1990).

2. The Colorado House is bound by its own chamber rules, which set procedures for amending bills in committee and on the floor and set speaking time and turn limits during the third reading on the floor (NCSL 1992).

3. Of the 164 House bills that did not become law, 52.4% died in first committee, 17.6% died in second committee (usually this was House Appropriations), 10.3% died on the House floor, 17.6% died in the Senate, and 2.0% were vetoed

by the governor.

- 4. The larger sample of 68 bills were selected from all 360 bills introduced in the 1989 session of the Colorado State House based on a number of criteria: (1) sex of the sponsor, (2) sponsor's terms in the legislature, (3) issue area of the bill, (4) state fiscal impact, and (5) public visibility. The sample of 68 bills was representative of the 360 bills introduced in the 1989 session in terms of these criteria and legislative outcome factors, including House committee hearing outcomes, amendment action, House or Senate floor action, and governor action (see Kathlene 1991).
- 5. This time elapsed to speaking does not include committee members who were silent during the entire hearing. The measures of words spoken and turns taken captures silent members, where silent speakers' words and turns are coded as 0.
 - 6. I found that sponsor amendments were likely to result

SPEAKERS	% TIME ELAPSED	WORDS SPOKEN	TURNS TAKEN	INTERRUPTS MADE (%)
All speakers ^a				
Words spoken	42	-	_	****
Turns taken	40	.37	_	and the same of th
Interruptions made (%)	43	.49	.75	
Interruptions received (%)	31	.29	.61	.42
Committee members only ^b				
Words spoken	36		_	Monorma
Turn taken	45	.82		vancours.
Interruptions made (%)	11	.21	.42	*****
Interruptions received (%)	37	.65	.59	17
Witnesses only ^c				
Words spoken	40		_	A
Turns taken	24	.83		
Interruptions made (%)	21	.31	.39	
Interruptions received (%)	03	.28	.48	.34

from one of three conditions: (1) the sponsor did not have all the relevant detailed information before the legislative deadline for introducing bills, (2) the amount of the fiscal note had not been determined by the legislative staff prior to bill introduction (typical for the majority of bills), and (3) negotiations with interested groups had already occurred between the time the bill was introduced and its first committee

7. A high number of turns taken could also reflect interruptions, in which case turns taken would not be a good measure of active speaking involvement. Overall, however, interruptions accounted for only an average of 11.2% of the speaker turnovers. However, this low interruption rate may vary by groups, so that each analysis also included a test of differences in mean words spoken per turn by dividing the number of each speaker's words spoken by the number of full turns the speaker took. A full turn was a substantive utterance and did not include turns restricted to only social introductions or parliamentary procedures. An interrupted turn was likely to be substantive as speakers tended to interrupt during more heated debates of the issue. In each subanalysis reported here, there were no significant differences found in the measure of words spoken per turn. Therefore, I believe that the number of turns taken does accurately measure the extent of speaking engagement.

8. All the committee member regression analyses were run twice—first using freshman status as the tenure variable and then using terms in the legislature (1-4) as the tenure variable. The analyses did not differ based on the measure of tenure

used.

9. The variable capturing the feminization of the committee hearing was coded in two different ways: as the three-interval categories described in the text and as a continuous percentage measure. Both variables performed similarly in all the analyses.

10. It was common for the chair to invite the sponsor to express a preference for the order of the witnesses. Sometimes the sponsor was interested in ordering all of the witnesses, but usually the sponsor only had a preference for who spoke first. Therefore, any gender differences found in the amount of hearing time elapsed before speaking could be an indicator of gendered *sponsor* treatment of the witnesses as much as, if not more than, differential treatment by the chair.

11. A full interaction regression model was also run but the sex/hearing interaction terms did not significantly improve the explained variance. The only difference between the main-effects hearing characteristics and the interaction model was the emergence of male interruption patterns that accounted for the increased interruptions made under a female

chair and at a family hearing.

12. It is not hard to distinguish between familiar and unfamiliar witnesses. When a chair knows the witness, he or she usually make a remark indicating their familiarity, such as "Nice to see you again" or "It's been a long time since you've come to this committee." A witness who is unknown elicits slower and more careful (if not mistaken) enunciation of their name, along with the chair offering precise directions to the witness: "State your name and whom you represent, for the tape."

13. Dr. Elisa Jones is a fictitious name.

14. The categories of the type of turns resembles Hall's (1987) coding of chair's turns as administrative vs. substantive, although I further breakdown substantive remarks based on my personal observations, in committee hearings, that chairs become involved in the issues of the hearing in two distinct ways.

DOMESTIC POLITICAL AUDIENCES AND THE ESCALATION OF INTERNATIONAL DISPUTES

JAMES D. FEARON University of Chicago

International crises are modeled as a political "war of attrition" in which state leaders choose at each moment whether to attack, back down, or escalate. A leader who backs down suffers audience costs that increase as the public confrontation proceeds. Equilibrium analysis shows how audience costs enable leaders to learn an adversary's true preferences concerning settlement versus war and thus whether and when attack is rational. The model also generates strong comparative statics results, mainly on the question of which side is most likely to back down. Publicly observable measures of relative military capabilities and relative interests prove to have no direct effect once a crisis begins. Instead, relative audience costs matter: the side with a stronger domestic audience (e.g., a democracy) is always less likely to back down than the side less able to generate audience costs (a nondemocracy). More broadly, the analysis suggests that democracies should be able to signal their intentions to other states more credibly and clearly than authoritarian states can, perhaps ameliorating the security dilemma between democratic states.

n international crisis occurs when one state resists a threat or demand made by another, with both taking actions that suggest that the dispute might be decided militarily. Crises are frequently characterized as "wars of nerves." Measures such as troop deployments and public threats make crises public events in which domestic audiences observe and assess the performance of the leadership. For reasons linked to this public aspect of crises, state leaders often worry about the danger that they or their adversary might become locked into their position and so be unable to back down, make concessions, or otherwise avoid armed conflict.

In this article I model an international crisis as a political "war of attrition." The formalization is motivated by an empirical claim, namely that crises are public events carried out in front of domestic political audiences and that this fact is crucial to understanding why they occur and how they unfold. I characterize crises as political attrition contests with two defining features. First, at each moment a state can choose to attack, back down, or escalate the crisis further. Second, if a state backs down, its leaders suffer audience costs that increase as the crisis escalates. These costs arise from the action of domestic audiences concerned with whether the leadership is successful or unsuccessful at foreign policy (Fearon 1990, 1992; Martin 1993).

The formalization has three major benefits. First, it helps answer an important question about the origins of war that is missed in the informal literature and begged by existing formal models of crisis bargaining. Briefly, if fighting entails any cost or risk, then rational leaders would not choose war until they had concluded that attack was justified by a sufficiently low chance of an acceptable diplomatic settlement. Thus another way to ask the question "Why do wars occur?" is to ask what leads states to abandon the hope of a cheaper, nonmilitary resolution. A theoret-

ical answer requires us to explain how a state with rational leaders would *learn*. During a crisis, how do leaders come to revise their beliefs about an opponent so that attack is preferred to holding out for concessions? I shall argue that neither the informal nor the formal literature on international conflict supplies satisfactory answers.

The answer suggested here is that audience costs are an important factor enabling states to learn about an opponent's willingness to use force in a dispute. At a price, audience costs make escalation in a crisis an informative although noisy signal of a state's true intentions. They do so in part by creating the possibility that leaders on one or both sides will become locked into their position and so will be unable to back down due to unfavorable domestic political consequences. I find that in the model, a crisis always has a unique horizon—a level of escalation after which neither side will back down because both are certainly locked in, making war inevitable. Before the horizon is reached, the fear of facing an opponent who may become committed to war puts pressure on states to settle. The model thus captures a common informal story about international crises—that their danger and tension arise from the risk of positions hardening to the point that both sides prefer a fight to any negotiated settlement.

The second major benefit of the formal analysis is a set of comparative statics results that provide insights into the dynamics of international disputes. The strongest and most striking of these bear on the question of which state is more likely to concede in a confrontation. I find that regardless of the initial conditions, the state more sensitive to audience costs is always less likely to back down in disputes that become public contests. The intuition is that the greater the domestic cost for escalating and then backing down, the more informative is the signal of escalation and the less escalation is required to con-

vey intentions. A stronger domestic audience thus allows a state to signal its true preferences concerning negotiated versus military settlements more credibly and more clearly.

This result and the audience cost mechanism underlying it suggest hypotheses about how state structure might influence crisis bargaining. For example, if actions such as mobilizing troops create larger audience costs for democratic than for authoritarian leaders, then democratic states should be less inclined to bluff or to try "limited probes" in foreign policy—to make military threats and then back off if resistance is met. More broadly, stronger domestic audiences may make democracies better able to signal intentions and credibly to commit to courses of action in foreign policy than nondemocracies, features than might help ameliorate "the security dilemma" (Herz 1950; Jervis 1978) between democratic states.

The comparative statics results also speak to the question of how relative military capabilities and relative interests influence the outcomes of international disputes. Conventional wisdom suggests that the state with inferior military capabilities, or with fewer "intrinsic interests" at stake, is more likely to back down (e.g., George and Smoke 1974, 556-61; Jervis 1971; Snyder and Diesing 1977, 189-95). Surprisingly, in the model, neither the balance of forces nor the balance of interests has any direct effect on the probability that one side rather than the other will back down once both sides have escalated. The reason is that in choosing initially whether to threaten or to resist a threat, rational leaders will take into account observable indices of relative power and interest in a way that tends to neutralize their impact if a crisis ensues. For example, a militarily weak state will choose to resist the demands of a stronger one only if it happens to be quite resolved on the issues in dispute and so is relatively willing to escalate despite its military inferiority. The argument implies that observable aspects of capabilities and interests should strongly influence who gets what in international politics but that their impact should be seen more in uncontested positions and faits accomplis than in crises. Which side backs down in a crisis should be determined by relative audience costs and by unobservable, privately known elements of states' capabilities and resolve.

The third major benefit of the analysis is slightly more technical. The model clarifies how international crises differ structurally from the classical war of attrition studied by economists and theoretical biologists (Maynard Smith 1982, chap. 3; Tirole 1989, chap. 8). In the classical case, two firms (or animals) compete for control of a market (or territory) that is not large enough to support both at a profit. The competition lasts until one or both players "quit." International crises are analyzed here as a war of attrition that differs from the classical model in two important respects. First, in crises state leaders possess an additional option beyond continuing the contest or quitting—they can always choose to attack. Second, whereas in the classical war of attrition both sides pay

costs for continuing the contest, in international crises it is empirically more plausible to assume that only the side that backs down suffers audience costs. The existence of a military "outside option" along with audience costs proves to have major consequences for strategic behavior. Together they create the possibility of "lock in" and thus give crises a horizon. More technically, whereas the classical war of attrition has an infinity of (asymmetric) equilibria involving delay, the game studied here has a unique equilibrium distribution on outcomes up to the horizon.

First, I briefly review the relevant formal literature and also elaborate the theoretical puzzle: Given incentives to misrepresent, how can states involved in a dispute rationally reach the conclusion that the opponent would prefer war to backing down? I then informally discuss possible answers, arguing for the centrality of domestic audience costs, model an international crisis as a political attrition contest to examine the logic of equilibrium behavior, and, finally, draw some general conclusions.

THE THEORETICAL PUZZLE

The costs and risks of war supply states with strong incentives to locate nonmilitary settlements that both sides would prefer to a fight. Most often, it seems, their efforts are successful: very few international disagreements become wars. This may seem unsurprising at first glance. One might expect that given the incentives to avoid war, state leaders who disagree on some issue could simply tell each other what they would be willing to accept rather than fight, and then choose a mutually acceptable bargain. The problem, however, is that states can also have strong incentives to misrepresent their willingness to fight in order to gain a better deal. Given these incentives, quiet diplomatic exchanges may be rendered uninformative about a state's preferences. For example, in the Cuban Missile Crisis Kennedy did not ask Khrushchev what he would do if the United States were to impose a blockade or to attack the missile sites in Cuba: answers would have been almost worthless as indicators, due to Khrushchev's incentives to misrepresent (and Kennedy may also have had an incentive not to tip his hand) (cf. Wagner 1989, 197).

States in a dispute thus face a dilemma. They have strong incentives to learn whether there are agreements both would prefer to the use of force, but their incentives to misrepresent mean that normal forms of diplomatic communication may be worthless. I argue that international crises are a response to this dilemma. States resort to the risky and provocative actions that characterize crises (i.e., mobilization and deployment of troops and public warnings or threats about the use of force) because less-public diplomacy may not allow them credibly to reveal their own preferences concerning international interests or to learn those of other states.

To support this claim it must be shown how such actions can credibly reveal that a state would prefer

using force to making concessions. In particular, how is it that actions like mobilization and public warnings allow learning? If states can have incentives to misrepresent their willingness to use force, why should such actions be taken as credible indicators?

For the most part, the informal literature on international conflict and the causes of war takes it as unproblematic that actions such as mobilization "demonstrate resolve." The literature has focused instead on how psychological biases may impair a leader's ability to interpret crisis signals (e.g., Lebow 1981; Snyder and Diesing 1977, chap. 4; Jervis, Lebow, and Stein 1985). The prior question of how a rationally led state would learn in a crisis, given incentives to misrepresent, has not been answered in a theoretically thorough or satisfactory way.

Consider the inference problem faced by a state whose adversary in a dispute has just mobilized troops. If rational, the state's leaders should increase their belief that the adversary will fight only if a high-resolve adversary is more likely to mobilize than an adversary that in fact prefers backing down to war. Thus, if mobilization is to convey information and allow learning, it must carry with it some cost or disincentive that affects low-resolve more than highresolve states. In Spence's (1973) terms, mobilization (or any other move in a crisis) must be a costly signal if it is to warrant revising beliefs. Costless signals, which often include private diplomatic communication and sometimes more public measures, will be so much "cheap talk," since a state with low resolve may have no disincentive to sending them.

To explain how states learn in a crisis, we need to know what makes escalation or delay costly for a low-resolve state that in fact prefers making concessions to military conflict. It is tempting to answer "the risk of war", but this would beg the question since we are trying to establish how this risk arises in the first place. I shall argue that the role of domestic political audiences has typically been crucial for generating the costs that enable states to learn. First, however, I briefly review how the published formal literature on crisis bargaining has addressed the issue.

A number of studies have developed models in which states rationally update their beliefs about an adversary's resolve in the course of a crisis (Bueno de Mesquita and Lalman 1992; Fearon 1990, 1992; Kilgour 1991; Morrow 1989; Nalebuff 1986; Powell 1990; Wagner 1991). Though this is not always apparent, the mechanism that enables learning in each case is costly signaling.

While updating of beliefs occurs in these models, they actually do not address the question of how and why states might rationally come to conclude that fighting was preferable to holding out for concessions. The reason is that almost all of the models have finite horizons: the modeler exogenously determines that one of the states in the game will have a final choice between backing down or fighting. In effect, one player will ultimately have no choice but to "take it or leave it," and this restriction creates a cost for escalation. In actual crises, by contrast, whenever a

state has the option of attacking it also has the option of delaying or doing nothing. If there are horizons in actual crises they arise *endogenously*, as a consequence of the fact that for some reason waiting ultimately becomes an undesirable choice. Models that exogenously fix a horizon cannot explain why a state would choose to use force (and thus why wars occur) because they cannot explain what makes force preferable to holding out for concessions by the other side.

There are two partial exceptions to this argument. Nalebuff's (1986) and Powell's (1990) models of nuclear brinkmanship have something like an infinite horizon: they allow states to escalate in a crisis indefinitely, until one side backs down or nuclear war occurs. However, in these models states never *choose* to attack. Instead, war can occur only as a result of an accident beyond either side's control. Thus these formalizations cannot and were never intended to explain why states would *consciously* choose to abandon peace for war.

Historically, war has virtually always followed from the deliberate choices of state leaders, if not always as the result they originally intended (Blainey 1973; Howard 1983). Since this pattern seems likely to continue even in the nuclear age, it makes sense to ask how states could reach the conclusion that attack was worth choosing.

AUDIENCE COSTS, STATE STRUCTURE, AND LEARNING IN INTERNATIONAL DISPUTES

I shall consider several types of costs that could serve to make the actions that states take in crises informative about their actual willingness to fight. I argue that while there are several plausible candidates that may play a role in specific cases, audience costs are probably most important and characteristic of crisis bargaining. I shall then discuss variations in audience costs across regime types, suggesting that they may be most significant in states where foreign policy is conducted by an agent on behalf of a principal, as in democracies.

Signaling Costs in Crises

Two sorts of costs that leaders face for backing down in a crisis should be distinguished. First, there is the domestic and international price for conceding the issues at stake, which is the same regardless of when concessions are made or after how much escalation. Second, there are whatever additional costs are generated in the course of the crisis itself. By the costly signaling argument, only such added costs can convey new information about a state's resolve. To ask what enables learning in a crisis—and thus why some states ultimately choose to attack—is to ask what makes escalating and then backing down worse for a leader than simply conceding at the outset.

There are a number of possible mechanisms,

grouped here into three categories: physical costs, costs linked to the risk of accidental or preemptive war, and international and domestic audience costs.

The first class includes the financial and organizational costs of mobilizing and deploying troops and also simple impatience ("time preferences") on the part of state leaders. The economic burden of mobilization is sometimes significant enough to convey information about resolve. The fact that Israel's economy cannot bear full mobilization for very long may make Israeli mobilization unusually informative (Shimshoni 1988, 110). One could also argue that the enormous costs of Desert Shield, given well-known U.S. budget constraints, helped make the deployment a (partially) credible indicator of Bush's preferences (Fearon 1992, 153-54). But since the early nineteenth century, the financial costs of mobilization rarely seem the principal concern of leaders in a crisis, particularly in comparison to how their performance looks to domestic and foreign audiences. In few cases do financial costs seem to be what makes crises into political "wars of nerves."3

For similar reasons, pure time preferences appear less significant a signaling mechanism in crises than in buyer-seller bargaining and other economic examples.4 Under time preferences, delay in a crisis would be a costly signal because a leader with a high value for settlement versus war is relatively more impatient to enjoy whatever benefits a resolution would allow. If state leaders are sometimes impatient for a deal, it seems more often due to domestic political pressures (e.g., American elections or Gorbachev or Yeltsin's need for cash) than to a pure preference by the leader for "territory today rather than next month."

The second class of signaling costs concerns risks of war that are generated in some direct way by crisis escalation. Schelling's famous notion of the "threat that leaves something to chance" falls into this category (1960, chap. 8). Schelling suggested that in nuclear crises, at least, escalation or delay might create a risk of war resulting from something other than the deliberate choices of state leaders (e.g., a mechanical mishap or an unauthorized launch). If such risks exist, then escalation in a crisis will be a costly signal of resolve, since the risks are less worth running for a state with low interest in the issues at stake.

In the Cuban Missile Crisis, American decision makers did indeed worry about the risk of war stemming from a mechanical or a command-andcontrol accident (e.g., Blight and Welch 1990, 109, 311). But even in this most intense of all nuclear crises (a "best case" for the threat-that-leaves-somethingto-chance argument), the key decision makers were much more concerned about risks of war connected to what the other side would *choose* to do. While the risk of accidental war may contribute to crisis learning, it rarely, if ever, seems to provide the main cost of escalating a dispute.6

First-strike advantages, or incentives for preemptive war, provide a more appealing explanation in this class. If escalating a crisis entails a risk the other side will conclude that concessions are unlikely

enough to justify seizing a first-strike advantage, then escalation might be a costly signal of resolve. By running a real risk of preemption, delay in a crisis might credibly reveal a high willingness to fight rather than concede.

This mechanism appears to have figured in some historical cases. For example, part of what made the Russian mobilization in 1914 an informative signal of Russia's willingness to fight was that it was undertaken in the knowledge that it would increase Germany's incentive to choose preemptive war (Fearon 1992, chap. 5).7 In theory, however, first-strike advantages could also have the opposite effect. A state might conclude that since the adversary has not so far availed itself of a first strike, it must be more willing to back down than initially anticipated. Further, major concerns about loss of first-strike advantage do not seem common in case-evidence on international crises, and even when such concerns are present, as in 1914, they often compete with worries about the

political disadvantages of going first.8

While each of the preceding mechanisms may well foster crisis learning in some cases, I would argue that none fits with our intuitive sense of what it is that makes international crises into political wars of nerves. The reason is that none of these mechanisms recognizes the public aspect of crises, the fact that they are carried out in front of political audiences evaluating the skill and performance of the leadership. In prototypical cases (e.g., the standoff leading to the 1991 Gulf War, the Cuban Missile Crisis, and July 1914), a leader who chooses to back down is (or would be) perceived as having suffered a greater "diplomatic humiliation" the more he had escalated the crisis. Conversely, our intuition is that the more a crisis escalates, the greater the perception of diplomatic triumph for a leader who "stands firm" until the other side backs down.

Political audiences need not and do not always have this pattern of perceptions and reactions: they are social conventions that are at times resolved differently. For example, leaders of small states may be rewarded for escalating crises with big states and then backing down, where they would be castigated for simply backing down. Standing up to a "bully" may be praised even if one ultimately retreats. Nonetheless, at least since the eighteenth century leaders and publics have typically understood threats and troop deployments to "engage the national honor," thus exposing leaders to risk of criticism or loss of authority if they are judged to have performed poorly by the relevant audiences. Two illustrations follow, both taken from eighteenth-century diplomacy. While a wealth of similar examples are available from the nineteenth and twentieth centuries, these earlier cases suggest that political audiences have mattered in international confrontations for a long time.

The Seven Years War (1757-64) between France and Britain was preceded by several years of "crisis" diplomacy—threats, warnings, and troop mobilizations and deployments (Higonnet 1968; Smoke 1977, chap. 8). In response to French demands on the Ohio

River Valley, the Duke of Newcastle chose in late 1755 to send two regiments to America to impress the French with British resolve. The decision distressed several of Newcastle's colleagues and ambassadors, who seem to have felt that the action engaged the honor of the king and so committed the cabinet to a warlike course, perhaps unnecessarily. One wrote, "It requires great dexterity to conduct [these diplomatic and military moves] in such a manner to maintain the honor of King and Nation" (Higonnet 1968, 79). In a later interview with Rouillé, the French minister of foreign affairs, the British ambassador reported that the minister "complain'd very much of the licentiousness of our Publick papers in exaggerating things beyond measure which only served to irritate and stir up animosity amongst the lower sort of People in both Nations without a just cause" (p. 80). This complaint suggests that even in nondemocratic, eighteenth-century France, a minister could be concerned with what I have called domestic audience costs: it seems that British pamphlets could have the effect of increasing Rouille's costs for acceding to British demands (as they increased Newcastle's domestic costs for ceding French demands).

About 35 years later, Britain and Spain nearly went to war over an obscure incident involving alleged Spanish insults to British seamen who had landed on Vancouver Island, along with competing claims on the territory (Manning 1904). Once again, both states resorted to troop mobilizations, forceful diplomatic notes, and public threats. There is strong evidence that these moves created significant domestic audience costs for Prime Minister William Pitt: "With an election imminent, the Opposition was ready to make the most of any of the Government's mistakes in negotiating" (Norris 1955, 572). Pitt's vote for navy credits in Parliament and his government's publication of an account of the Vancouver incident led opposition politicians almost to clamor for appropriate satisfaction of British honor and right. Pitt would have faced serious domestic political costs for backing down, much larger than if he had chosen initially to pursue a less public and aggressive line in the dispute. 10

The notion that troop movements and public demands or threats "engage the national honor"—thus creating audience costs that leaders would pay if they backed down-continues strongly through the nineteenth and twentieth centuries. Such costs can be classified according to whether the audience that imposes them is domestic or international. Relevant domestic audiences have included kings, rival ministers, opposition politicians, Senate committees, politburos, and, since the mid-nineteenth-century, mass publics informed by mass media in many cases. Relevant international audiences include a state's opponent in the crisis and other states not directly involved, such as allies. Here the costs of escalating and then backing down would be felt indirectly through injury to the state's reputation for threatening the use of force only when serious.

Leaders engaged in disputes appear to worry about

both international and domestic audiences. Domestic audience costs may be primary, however. Backing down after making a show of force is often most immediately costly for a leader because it gives domestic political opponents an opportunity to deplore the international loss of credibility, face, or honor. 11 Because governments are far more likely to be deposed or to lose authority due to internal political developments than due to foreign conquest and because opposition groups frequently condition their activities on the international successes and failures of the leaders in power, domestic audiences may provide the strongest incentives for leaders to guard their states' "international" reputations. Audience costs thus figure in a domestic system of incentives that encourages leaders to have a realist concern with their state's "honor" and reputation before international audiences.

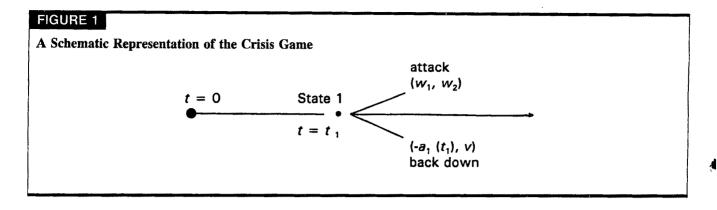

Agency Relations and Audience Costs

As noted, audience costs have a strongly conventional aspect; how they are felt and implemented depends on shared perceptions and expectations in a society. Nevertheless, the historical norm seems to have domestic political audiences punishing a leader who concedes after having deployed troops more than one who concedes outright. Why this norm? My theoretical results will suggest a possible explanation, which I anticipate here in order to develop some broader points about how audience costs vary across types of states.

Equilibrium analysis of the crisis model reveals that a state's ex ante expected payoff in a dispute is *increasing* in the degree to which escalatory moves create audience costs for the state's leadership. The reason, in brief, is that greater audience costs improve a state's ability to commit and to signal resolve.

Thus both democratic and nondemocratic leaders should have an incentive to represent that they will pay added domestic political costs for "engaging the national honor" and subsequently backing down. The extent to which such representations are believable, however, depends on the nature of the domestic political institutions that the leadership faces. In democracies, foreign policy is made by an agent on behalf of principals (voters) who have the power to sanction the agent electorally or through the workings of public opinion. By contrast, in authoritarian states the principals often conduct foreign policy themselves. The result here suggests that in the former case, if the principal could design a "wage contract" for the foreign policy agent, the principal would want to commit to punishing the agent for escalating a crisis and then backing down. On the other hand, principals who conduct foreign policy themselves may not be able credibly to commit to self-imposed punishment (such as leaving power) for backing down in a crisis.12

Examples of the apparent effect and import of forceful public speeches by democratic and nondemocratic leaders suggest that this argument is at least

plausible. Repeatedly, leaders in democratic countries have been able credibly to jeopardize their electoral future by making strong public statements during international confrontations. A few prominent examples are Lord Salisbury's speeches during the Fashoda crisis of 1898, Lloyd George's Mansion House speech during the Agadir crisis of 1911, Kennedy's televised speech announcing the presence of Soviet missiles in Cuba, and Bush's many declarations on Kuwait in 1990 (including the "this will not stand" remark). 13 By contrast, even more forceful public bluster by authoritarian leaders (e.g., Hitler, Khrushchev, Mao, and Saddam Hussein) appears to create fewer credible audience costs, and to have correspondingly lower value as signals of intent. For example, it was quite difficult for Western observers to know what to conclude about Saddam Hussein's willingness to fight from his many strong public refusals to pull out of Kuwait in the Fall of 1990. One reason, I would argue, is that it was difficult to know what, if any, added domestic political costs such a tyrant would suffer for making concessions at the last minute.

This is not to suggest that authoritarian states are completely unable to generate audience costs in international confrontations or that democracies can invariably do so. On the one hand, nondemocracies may evolve institutional arrangements in foreign policy that give domestic audiences an ability to sanction decision makers. For example, the politburo after Stalin could sanction the paramount Soviet leader, and eighteenth- and nineteenth-century monarchs could replace unsuccessful ministers. Moreover, since the price of losing power is often greater for a dictator than for an elected leader, a weak or unstable authoritarian regime might be able to create significant expected audience costs in a crisis. On the other hand, in democracies the existence of multiple politically relevant audiences may make it difficult for foreign leaders to gauge the costs created by public statements or actions, particularly before elections. The idea that democratic leaders on average have an easier time generating audience costs is advanced here as a plausible working hypothesis that has interesting theoretical and empirical implications.

INTERNATIONAL CRISES AS POLITICAL ATTRITION CONTESTS

I shall describe a model of a crisis as a political attrition contest, informally discuss equilibrium behavior when the states know each other's values for conflict, and then develop the main results on equilibrium with uncertainty about resolve.

Two states—1 and 2—are in dispute over a prize worth v > 0. The crisis occurs in continuous time, starting at t = 0. For every finite $t \ge 0$ before the crisis ends, each state can choose to attack, quit, or escalate. The crisis ends when one or both states attack or quit. "Escalate" can be thought of either as simply waiting or as taking actions such as mobilizing or preparing troops.

Payoffs are given as follows. If either state attacks before the other quits, both receive their expected utilities for military conflict, w_1 and w_2 . These are the states' values for war, incorporating military expectations, values for objects in dispute, and costs for fighting. They can be thought of as levels of "resolve," since the higher w_i , the higher the risk of war state i is willing to run in hope of attaining the prize. Throughout, I shall suppose that neither w_1 nor w_2 is greater than 0.14

If state i quits the crisis before the other has quit or attacked, then its opponent j receives the prize while i suffers audience costs equal to $a_i(t)$, a continuous and strictly increasing function of the amount of escalation with $a_i(0) = 0$. I will often consider the linear case $a_i(t) = a_i t$, where $a_i > 0$ is a parameter indicating how rapidly escalation creates audience costs for state i. Figure 1 schematically depicts the structure of the contest, with payoffs indicated in the case that state 1 quits or attacks first at time t_1 . ¹⁵

Call this game, with common knowledge of all parameters, G and the subgame beginning at t, G(t). A pure strategy in G is a rule s_i specifying a finite time $t \ge t'$ to quit or attack in every G(t'), for all $t' \ge 0$. I shall write $\{t$, attack $\}$ for the subgame strategy "escalate up to t, then attack" and $\{t$, quit $\}$ for "escalate up to t, then quit."

Equilibrium under Complete Information about Resolve

If the states knew each other's levels of resolve, they could in principle look ahead and anticipate what would happen if they were to escalate and create a crisis. For example, in the linear case where $a_i(t) = a_i t$, they would see that ultimately the audience costs for backing down would be so large that neither would quit: doing so would be strictly worse than attacking. In other words, both states would eventually become "locked in."

However, they would also notice that one side would become locked in *before* the other (excepting certain symmetric cases). Suppose, for example, that audience costs increase linearly and at the same rate on both sides, and that state 1's value for war is higher than state 2's. Then if both sides escalated the crisis, state 1 would reach the point where its leaders preferred conflict to backing down sooner than state 2 would. At this point, state 1 has in effect committed itself not to back down, while state 2 still prefers making concessions to a fight. Thus a rational state 2 would have to back down at this point. Anticipating this at the outset, state 2 would quit immediately rather than pay the larger audience costs that would go with publicly observable escalation. ¹⁶

Thus with complete information about resolve, no public crisis occurs. Instead, if audience costs increase at the same rate on both sides, the state with the lower value for conflict immediately cedes the prize rather than incur costs above those associated with the loss on the issue. If audience costs increase at different rates, then the side with weaker audience effects may be forced to concede even if it has a higher value for war (since it may require more escalation to commit itself to fight).

This equilibrium logic mirrors a logic found in many analytic and diplomatic historical discussions of international disputes. It is often argued that in crises that do not become wars, states look ahead and the side expecting to do worse in military conflict then backs down. But the standard argument does not work by itself: audience costs are required. If it were known that the state with the higher value for war nonetheless preferred making some concessions to a fight, why should the state with the lower value for war necessarily back down? If both prefer concessions to a fight, how can either make a credible threat to go to war and why should this be related to their values for military conflict? Increasing audience costs supply an answer. The state with the higher value for war may be able, in a public crisis, to reach more quickly the point where it prefers conflict to paying the audience costs of backing down.

Incomplete Information about Resolve

With complete information, no public war of nerves occurs because the ultimate outcome can be seen in advance. In a rationalist framework, international crises occur precisely because state leaders *cannot*

anticipate the outcome, owing to the fact that adversaries have private information about their willingness to fight over foreign policy interests and the incentive to misrepresent it. I now consider equilibrium in the model in which the states have private information about their willingness to go to war.

Three main theoretical results are developed. Proposition 1 establishes that in any equilibrium in which a crisis may occur, the crisis has a unique *horizon*—an amount of escalation after which neither state will back down and war is certain. Proposition 2 characterizes the set of equilibria in which a crisis may occur. Proposition 3 asserts that in this set, the probability distribution on outcomes is unique up to the horizon time. Throughout, the equilibrium concept is a modification of perfect Bayesian equilibrium (Fudenberg and Tirole 1991) for an infinite game, with an additional restriction ruling out strongly optimistic off-equilibrium-path inferences. Details on the solution concept, along with all proofs, are given in the Appendix.¹⁷

Preliminaries. Formally, suppose that each state knows its own level of resolve w_i but knows only the distribution of its adversary's resolve w_j . For i=1,2, let w_i be distributed on the interval $W_i \equiv [\underline{w}_i,0]$, $\underline{w}_i < 0$, according to a cumulative distribution function F_i that has continuous and strictly positive density f_i . If refer to the crisis game with this information structure and all other elements assumed to be common knowledge as Γ.

In informal terms, f_1 and f_2 represent the states' precrisis beliefs about each other's value for war on the issue in dispute. For example, the more weight f_1 puts on values of w_1 that are close to 0 (as opposed to very negative), the greater is state 2's initial belief that 1 has a relatively high willingness to fight rather than make concessions.

Crises in the Model have a Unique Horizon. This proposition is developed by way of two lemmas, which also help to make clear the logic of strategic choice in the model. I begin with a definition. A crisis has a horizon if there is a level of escalation such that neither state is expected to quit after this point is reached. Formally, let $Q_i(t)$ be the probability that state i quits on or before t in some equilibrium. Then $t_h > 0$ is a horizon for Γ if in this equilibrium t_h is the minimum t such that neither $Q_1(t)$ nor $Q_2(t)$ increase for $t > t_h$. If a horizon exists, war has become inevitable by the time it is reached.

Lemma 1 establishes that in any equilibrium in which a crisis may occur, there must exist a horizon. Horizons are thus shown to arise *endogenously*, as a consequence of the equilibrium choices by the states involved. The intuition for this result is straightforward in the case of linearly increasing audience costs: eventually the price of backing down will be so great that even the least-resolved type of state would prefer to attack rather than quit. But the result holds even if "maximum escalation" (arbitrarily large t) will not

create large-enough audience costs to commit every type of state to war.

LEMMA 1. In any equilibrium of Γ in which both states choose to escalate with positive probability, there must exist a finite horizon $t_h < \infty$.

Lemma 2 characterizes the behavior of states that choose a strategy that could lead to war. The first part establishes that in equilibrium no state will choose to attack *before* a horizon time. When there is no advantage to striking first, a state unwilling to make concessions will want to delay attack as long as there is any chance that the other side will back down, thus avoiding the risk of an unnecessary military conflict while maximizing the chance of a "foreign policy triumph."

The second part of the lemma shows that a state will choose the strategy of escalating to the horizon and then attacking if and only if its privately known level of resolve, w_i , is sufficiently large. Thus crises in the model separate states according to their unobservable willingness to fight over the issues: a highly resolved state credibly reveals its motivation by choosing an unyielding crisis-bargaining strategy. This gives it a greater chance of prevailing if the crisis ends peacefully but at the (unavoidable) price of a greater risk of war (cf. Banks 1990). It follows that for outside observers, crisis outcomes must be unpredictable to a significant degree. Comparative resolve strongly influences the outcome, but the fact that resolve is privately known (and unobservable) gives rise to public crises in the first place.

LEMMA 2. In any equilibrium of Γ with t_h as the horizon and in which escalation may occur, (1) if state i chooses $\{t, attack\}$, it must be the case that $t \ge t_h$; and (2) state i will choose $\{t, attack\}$ where $t \ge t_h$ if $w_i > -a_i(t_h)$ and only if $w_i \ge -a_i(t_h)$ (for i = 1, 2).

Lemma 2 implies that the ex ante (precrisis) probability that state i will choose a strategy involving attack is $1 - F_i(-a_i(t_h))$, the prior probability, that $w_i \ge$ $-a_i(t_h)$. Thus we can write state i's ex ante expected utility for escalating up to a horizon time t_h and then backing down as $u_i(t_h) = F_j(-a_j(t_h))v^n + (1 - F_j(-a_j(t_h)))(-a_i(t_h))$. The function $u_i(\cdot)$ proves to play an important role in defining equilibrium strategies and establishing uniqueness. It is easily shown that $u_i(t)$ is continuous and strictly decreasing and that if audience costs increase "enough" with t there is a unique level of escalation $t_i^* > 0$ such that $u_i(t_i^*) = 0$. Loosely, if the opponent j can generate sufficient audience costs by escalating a crisis, there will be a unique level of escalation such that state *i* would be indifferent between backing down at t = 0 and at t_i^* were this the horizon. I assume in what follows that the states are able to use escalation to generate audience costs at least this large.20

Proposition 1, which follows from lemmas 1 and 2 and from the observations about $u_i(\cdot)$, establishes that if a horizon exists it is unique and is defined as $t^* = \min\{t_1^*, t_2^*\}$. To give a bit of intuition, if a crisis were expected to have a horizon longer than t^* , low-

resolve states would prefer to quit immediately rather than "bluff" up to t^* , so t^* could not be the true horizon. On the other hand, if the crisis were expected to have a shorter horizon than t^* , then at least one side would have incentives to bluff by escalation that would make equilibrium unsustainable at t^* : the signal sent by escalating would not be informative enough.

PROPOSITION 1. Let t_i^* be the unique solution to $u_i(t) = 0$ for i = 1, 2 and let $t^* = min\{t_1^*, t_2^*\}$. For any equilibrium of Γ in which escalation occurs with positive probability, the horizon must be t^* .

Equilibrium Strategies and Beliefs. Proposition 2 details the incomplete-information crisis game's equilibria that involve escalation. It indicates that there is a family of substantively identical equilibria: all have t^* as the horizon and have essentially identical behavior in the crisis up to t^* . After t^* , the states may choose any time to attack; the payoff structure leaves this open, not incorporating any incentives for either military delay or an immediate strike. (For ease of exposition, I give normal form strategies that can satisfy the perfection requirements detailed in the Appendix.)

PROPOSITION 2. Take the labels 1 and 2 such that $t^* = t_2^* \le t_1^*$. Let $k_1 \equiv u_1(t^*) \ge 0$. The following describes equilibrium strategies for state i = 1, 2 as a function of type, w_i :

For $w_i \ge -a_i(t^*)$, state i plays $\{t, attack\}$ with any $t > t^*$

For $w_i < -a_i(t^*)$, state i plays $\{t, quit\}$, where t is chosen according to any pure strategies that yield the cumulative distributions

$$\mathfrak{D}_1(t) = \frac{1}{F_1(-a_1(t^*))} \frac{a_2(t)}{v + a_2(t)}$$

for state 1, and

$$\mathfrak{Q}_2(t) = \frac{1}{F_2(-a_2(t^*))} \frac{k_1 + a_1(t)}{v + a_1(t)}$$

for state 2, both on the interval [0, t*].

The states' beliefs in equilibrium are given as follows.

For $t \le t^*$, state i believes that the probability $j \ne i$ will not back down (i.e., $Pr(w_i \ge -a_i(t^*)|t)$) is

$$\frac{v+a_i(t)}{v+a_i(t^*)}.$$

For $t > t^*$, state i's beliefs follow by Bayes' Rule in accord with the opponent's strategy for attacking. For any $t > t^*$ off the equilibrium path, let i believe that $w_i > -a_i(t^*)$ and is distributed according to F_i , truncated at $-a_i(t^*)$.

PROPOSITION 3. In any equilibrium of Γ in which escalation may occur, the equilibrium distribution on outcomes before the horizon time t^* implied by proposition 2 is unique.

An Informal Description of Equilibrium Behavior. Equilibrium behavior in the incomplete information game has the essential features of a war of nerves. At the outset, one side is expected to prefer to make concessions quietly, without a public contest. This state concedes with some probability (k_1/v) at t=0. If it does not make concessions, then its adversary immediately raises its estimate of the state's willingness to fight, and the war of nerves begins. Neither side knows whether or exactly when the other might be locked in by increasing audience costs, but beliefs that the other prefers war to making concessions steadily increase as audience costs accumulate. The reason is that states with low resolve are increasingly likely to have backed down, the more the crisis escalates. Ultimately, in crises that reach the horizon, the only sorts of states remaining have relatively high values for war on the issue. At this point, both sides prefer conflict to backing down, and both know this: attack thus becomes a rational choice.

At a price, then, audience costs enable the states to learn about each other's true willingness to fight over the interests involved in the dispute.21 The price is paid in two ways. First, a state may escalate or delay for a time and then quit when its adversary matches it. Though the state is still unsure if the adversary really would be willing to fight rather than make concessions, its belief that this is possible has increased and it finds it worthwhile to cut its losses. Second, two states may escalate up to the horizon and then fight, even though one or both would have preferred making immediate concessions rather than this outcome. The dilemma created by private information and incentives to misrepresent is that neither can reliably learn that the other would be willing to go this far without taking actions that have the effect of committing both sides to a military settlement.

One further feature of equilibrium in the model deserves comment before I turn to more specific comparative statics results. The more a crisis escalates, the less likely is either side to back down (regardless of precrisis beliefs). In technical terms, the hazard rate is decreasing: the probability that one's opponent will quit after (say) five escalatory moves is less than the probability that the state will quit after four moves. Thus, as escalation proceeds, states in the model gradually become more pessimistic about the likelihood that the adversary will concede after the next round, and outside observers become increasingly concerned that war may be "inevitable."

AUDIENCE COSTS, CAPABILITIES, AND INTERESTS IN INTERNATIONAL DISPUTES

Comparative statics analysis of the equilibrium yields theoretical insights into how three variables affect state behavior and crisis outcomes. I consider in turn the impact of audience costs, relative military capabilities, and relative interests. For expositional convenience, I discuss the case of linearly increasing audience costs, $a_i(t) = a_i t$.

Audience Costs

A striking feature of the equilibrium behavior just described is that the state less able to generate audience costs (lower a_i) is always more likely to back down in disputes that become public contests. This holds regardless of the value of the prize to either side and regardless of the states' initial beliefs about the other's resolve. Thus if actions such as mobilization generate greater audience costs for democratic than for nondemocratic leaders, we should find the democracies backing down significantly less often in crises with authoritarian states. 22

By itself, intuition can justify the opposite prediction quite easily. One might think that the side less sensitive to its domestic audience would fear escalation less. Knowing this and fearing large costs of retreat, the side with a stronger domestic audience might then be more inclined to back down. But this argument misses the signaling value of escalation for a state with a powerful domestic audience. While such a state may be reluctant to escalate a dispute into a public confrontation, if it does choose to do so this is a relatively informative and credible signal of willingness to fight over the issue. That is, the greater the costs created by escalation for a leader, the more likely the leader is to be willing to go to war conditional on having escalated a dispute. Conversely, escalation by a state that will suffer little domestically for backing down says less about the state's actual willingness to fight.23

This dynamic has several further implications. First, the signaling and commitment value of a stronger domestic audience helps a state on average, by making potential opponents more likely to shy away from contests and more likely to back down once in them. In the model, a state's ex ante expected payoff increases with its audience-cost rate a_i . This result provides a rationale for why, ex ante, both democratic and authoritarian leaders would want to be able to generate significant audience costs in international contests.

Second, if democratic leaders tend to face more powerful domestic audiences, they will be significantly more reluctant than authoritarians to initiate "limited probes" in foreign policy. Showing this formally requires that we add structure to the model analyzed here, which does not represent an initial choice of one state to challenge or threaten the other. When such an option is added—say, state 1 chooses whether to accept the status quo or to challenge state 2—it is easily shown that the less sensitive state 1 is to audience costs, the greater the equilibrium probability that the state will try a limited probe. ²⁴

Third, when large audience costs are generated by escalation, fewer escalatory steps are needed credibly to communicate one's preferences. (Formally, the expected level of escalation decreases with a_1 and a_2 .) Thus crises between democracies should see signifi-

cantly fewer escalatory steps than crises between authoritarian states—an empirically supported prediction (Russett 1993, 21).

Finally, the equilibrium results bear on the question of how regime type influences the risk that a crisis will escalate to war. When two states in the model have the same audience cost rates $a = a_1 = a_2$, the risk of war conditional on a crisis occurring proves to be *independent* of *a*, other things being equal (cf. Nalebuff 1986).²⁵ As audience-cost rates diverge, the high-audience-cost state becomes more likely to escalate, while the lower-audience-cost state becomes more likely to back down. The net effect on the risk of war may be positive or negative, although it is positive for a broad range of plausible parameter values. For example, whenever the distribution of w_1 is uniform, the risk of war (given a crisis) strictly increases as a_1 increases above a_2 . The model thus suggests a theoretical mechanism that could conceivably help explain the observation that crises between democracies and nondemocracies are more warprone than are crises between democracies (Chan 1984; Russett 1993). In the model, democratic leaders have a structural incentive to pursue more escalatory, committing strategies when they face authoritarians than when they face fellow democrats, and this can generate a greater overall chance of war.

Relative Capabilities and Interests

Two of the most common informal claims about state behavior in international crises are that (1) the militarily weaker state is more likely to back down and (2) the side with fewer "intrinsic interests" at stake is more likely to back down. These arguments are problematic. If relative capabilities or interests can be assessed by leaders prior to a crisis and if they also determine the outcome, then we should not observe crises between rational opponents: if rational, the weaker or observably less interested state should simply concede the issues without offering public, costly resistance. Crises would occur only when the disadvantaged side irrationally forgets its inferiority before challenging or choosing to resist a challenge (Fearon 1992, chap. 2).

A second striking result from the equilibrium analysis is that observable measures of the balance of capabilities and balance of interests should be unrelated to the relative likelihood that one state or the other backs down in crises where both sides choose to escalate.

In formal terms, observable capabilities and interests influence the distribution of the states' values for going to war and thus the states' initial beliefs about each other's willingness to fight (f_1 and f_2). For example, the more the balance of military power favors state 1, the more state 1—and the less state 2—is initially expected to be willing to use force. Regarding interests, the more the issues in dispute are initially thought to be important for, say, state 1, the more state 1 is initially expected to be willing to fight rather than back down.

In equilibrium, the initial distributions of the states' values for war have a direct influence on the probability that one state or the other will concede without creating a crisis. In accord with intuition, the weaker state 2 is militarily or the less its perceived stake, the more likely it is to cede the prize without offering visible resistance.²⁷ However, if it *does* choose to escalate, then the odds that state 2 rather than state 1 will back down in the ensuing contest,

$$\frac{a_1v + a_1a_2t^*}{a_2v + a_1a_2t^*},$$

are not directly influenced by relative capabilities or interests. For example, when the states have the same audience cost rates ($a_1 = a_2$), they are equally likely to back down in a crisis and equally likely to go to war, regardless of ex ante indices of relative power or interests.

Less formally, the result suggests that rational states will "select themselves" into crises on the basis of observable measures of relative capabilities and interests and will do so in a way that neutralizes any subsequent impact of these measures. Possessing military strength or a manifestly strong foreign policy interest does deter challenges, in the model. But if a challenge occurs nonetheless, the challenger has signaled that it is more strongly resolved than initially expected and so is no more or less likely to back down for the fact that it is militarily weaker or was initially thought less interested.

CONCLUSION

International crises are a response to a dilemma posed by two facts about international politics: (1) state leaders have private information about their willingness to use force rather than compromise, and (2) they can have incentives to misrepresent this information in order to gain a better deal. In consequence, quiet diplomatic exchanges may be insufficient to allow states to learn what concessions an adversary would in truth be willing to make. I have argued that states resolve this dilemma by "going public"-by taking actions such as troop mobilizations and public threats that focus the attention of relevant political audiences and create costs that leaders would suffer if they backed down. Though there are exceptions, the historical norm seems to have domestic audiences punishing or criticizing leaders more for escalating a confrontation and then backing down than for choosing not to escalate at all.

A game-theoretic analysis showed that such audience costs allow states to learn about each other's willingness to fight in a crisis, despite incentives to misrepresent. When escalation creates audience costs for both sides, states revise upward their prior beliefs that the other is willing to use force as the crisis proceeds. If escalation reaches a certain level (the "horizon"), both states prefer fighting to backing

down, and both know this. At this point, attack becomes a rational choice.²⁸

Equilibrium analysis yielded several novel propositions about how audience costs, relative capabilities, and relative interests influence the outcomes of international confrontations. Some broader implications follow.

A substantial literature in international relations argues that international anarchy, combined with states' uncertainty about each other's motivations, is a powerful cause of international conflict (Glaser 1992; Herz 1950; Jervis 1978; Waltz 1959, 1979). Unsure of each other's intentions, states arm and take actions that may make others less secure, leading them to respond in kind. States' inability to commit themselves to nonaggressive policies under anarchy may exacerbate, or even make possible, such "security dilemmas."

The results of my analysis suggest that domestic political structure may powerfully influence a state's ability to signal its intentions and to make credible commitments regarding foreign policy. If democratic leaders can more credibly jeopardize their tenure before domestic audiences than authoritarian leaders, they will be favored in this regard. For example, in the model examined here, high-audience-cost states require less military escalation in disputes to signal their preferences, and are better able to commit themselves to a course of action in a dispute.

This observation provides a theoretical rationale that might help explain why the quality of international relations between democracies seems to differ from that between other sorts of states. If democracies are better able to communicate their intentions and to make international commitments, then the security dilemma may be somewhat moderated between them. For example, the leaders of a democratic state that is growing in power may be better able to commit themselves not to exploit military advantages that they will have in future, so reducing other states' incentives for preventive attack. 30 Likewise, alliance relations between democracies may be less subject to distrust and suspicion if leaders would pay a domestic cost for reneging on the terms of the alliance, so "violating the national honor" in the eyes of domestic critics.31

One tradition within realism argues that democratic leaders are at a disadvantage in the game of realpolitik: domestic constraints reduce their freedom to maneuver and so may prevent them from playing the game as hard or as subtly as it may require (e.g., Morgenthau 1956, 512-26). However, as Schelling (1960) observes, in bargaining a player can benefit from having fewer options and less room to maneuver. I have shown how the presence of a politically significant domestic audience can improve a democratic leader's ability to commit to a course of action and to signal privately known preferences and intentions in a clear, credible fashion. These are advantages that could help in the game of realpolitik and might also make democracies better able to cope with the security dilemma.

APPENDIX

A formal statement of the solution concept used for the incomplete information game follows. Because Γ has a continuum of information sets, standard definitions of perfect Bayesian equilibrium (Fudenberg and Tirole 1991) and sequential equilibrium (Kreps and Wilson 1982) do not apply. I propose an adaptation of perfect Bayesian equilibrium, adding a refinement criterion that rules out some optimistic interpretations of out-of-equilibrium play. To avoid measure-theoretic complications, attention is restricted to pure strategy equilibria. Throughout, i=1,2 and $j\neq i$.

I begin by defining a Bayesian Nash equilibrium for the normal form version of Γ . Here, a pure strategy for state i is a map s_i : $W_i \to \mathbb{R}^+ \times \{\text{quit, attack}\}$, where \mathbb{R}^+ is the set of nonnegative reals. Using F_i , every s_i induces a unique pair of cumulative distributions $Q_i(t)$ and $A_i(t)$, which are the probabilities that state i quits or attacks by t if i follows s_i . By the properties of cumulative distribution functions, $Q_i(t)$ and $A_i(t)$ are increasing, right-continuous, and have well-defined left-hand limits for all t (Billingsley 1986, 189). Let

$$Q_i^-(t) \equiv \lim_{s \to t^-} Q_i(s).$$

"State w_i 's" expected payoff for $\{t, \text{ quit}\}$, given s_j , is then

$$U_i^{q}(t, w_i) \equiv Q_j^{-}(t)v + (Q_j(t) - Q_j^{-}(t))((v - a_i(t))/2)$$
$$+ A_j(t)w_i + (1 - Q_j(t) - A_j(t))(-a_i(t))$$

or, if $Q_i(t)$ is nonatomic at t,

$$U_i^q(t, w_i) = Q_i(t)v + A_i(t)w_i$$

$$+ (1 - Q_i(t) - A_i(t))(-a_i(t)).$$

Similarly, type w_i 's expected payoff for $\{t, \text{ attack}\}$ given s_i is

$$U_i^a(t, w_i) = Q_j^-(t)v + A_j(t)w_i + (1 - Q_j^-(t) - A_j(t))w_i$$

= $Q_i^-(t)v + (1 - Q_i^-(t))w_i$.

DEFINITION. $\{t', quit\}$ $(\{t', attack\})$ is a best reply for type w_i given s_i if

 $t' \in argmax_t U_i^q(t, w_i) \text{ and } U_i^q(t', w_i) \geq max_t U_i^a(t, w_i)$

 $(t' \in argmax_t U_i^a(t, w_i) \text{ and } U_i^a(t', w_i) \geq max_t U_i^q(t, w_i)).$

DEFINITION. (s_1, s_2) is a Bayesian Nash equilibrium for the normal form version of Γ if (1) $\{F_i, s_i\} \Rightarrow \{Q_i(t), A_i(t)\}$, and (2) under s_i , every type w_i chooses a best reply, given s_i .

Just as the normal form version of the complete information game G has multiple Nash equilibria, so are there multiple Bayesian Nash equilibria for Γ . However, many of these require states to choose strategies that do not seem optimal or sensible in the dynamic (extensive form) setting. These are ruled out by the "perfection" requirements I shall give.

In the extensive form, a complete pure strategy in Γ is a map s_i : $\mathbb{R}^+ \times W_i \to \mathbb{R}^+ \times \{\text{quit}, \text{ attack}\}$, with the restriction that if $s_i(t', w_i) = \{t, \text{quit}\}$ or $\{t, \text{ attack}\}$, then $t' \leq t$. For all $t' \geq 0$, define the "continuation game" $\Gamma(t')$ as follows: (1) payoffs are as in Γ , except beginning at t'; and (2) "initial beliefs" are given by a cumulative distribution function $F_i(\cdot; t')$ on W_i . A strategy s_i implies a strategy for state i in every continuation game $\Gamma(t')$; call this $s_i|t'$. Further, using $F_i(\cdot; t')$, $s_i|t'$ induces a pair of unique "conditional" cumulative probability distributions $Q_i(t|t')$ and $A_i(t|t')$, analogous to $Q_i(t)$ and $A_i(t)$ already defined. From these, expected payoff functions for $\Gamma(t')$, $U_i^q(t|t', w_i)$ and $U_i^a(t|t', w_i)$ follow as before.

We can now define a weak extensive form solution concept requiring that (1) s_1 and s_2 induce Bayesian Nash equilibria in every continuation game $\Gamma(t)$, and (2) beliefs $F_i(\cdot;t)$ are formed whenever possible using Bayes' Rule and s_i , while $F_i(\cdot;t)$ can be anything when Bayes' Rule does not apply.

DEFINITION. $\{(s_1, s_2), F_1(\cdot; \cdot), F_2(\cdot; \cdot)\}\$ is a perfect Bayesian equilibrium for Γ if

- (A) (s_1, s_2) induces a Bayesian Nash equilibrium in Γ and for all $t \geq 0$, $(s_1|t, s_2|t)$ induces a Bayesian Nash equilibrium in $\Gamma(t)$, using $F_1(\cdot; t)$ and $F_2(\cdot; t)$; and
- (B) for all t such that t is reached with positive probability under s_i (i.e., $Q_i(t) + A_i(t) < 1$), $F_i(\cdot; t)$ is $F_i(\cdot)$ updated using Bayes' Rule and s_i .

This solution concept is weak in the sense that it imposes no restrictions on how states would interpret completely unexpected behavior by the adversary. For instance, if state 1 escalates unexpectedly at time t, the concept allows state 2 to conclude that state 1 is without doubt the *least resolved* type \underline{w}_1 . Further, it would allow state 2 to maintain this belief even as state 1 continued to escalate. Seemingly implausible "optimistic beliefs" of this sort can be used to support a continuum of perfect Bayesian equilibria in Γ for most initial parameter values (with t^* as the maximum possible horizon). The following criterion rules out such optimistic off-equilibrium-path inferences and so refines the set of equilibria. ³² It is stronger than is needed for the proofs that follow, but it has the advantage of a very simple definition:

(C) For all
$$t > 0$$
 such that $Q_i(t) + A_i(t) = 1$, $F_i(-a_i(t); t) = 0$.

This says that if state i escalates beyond t when it was expected to have quit or attacked prior to time t, then state j believes that i's value for war w_i is at least as great as i's value for backing down at time t. In the text and in what follows, I refer to a pair of strategies (s_1, s_2) and a system of updated beliefs $F_i(\cdot; t)$ that satisfy A, B, and C as an equilibrium of Γ . I now proceed to proofs of lemmas and propositions in the text, starting with several observations (proofs for observations 2 and 4 are straightforward and are omitted).

Observation 1. Suppose that in an equilibrium of Γ , $Q_i(t)$ is atomic at t'. Then $\{t'$, quit $\}$ and $\{t'$, attack $\}$ are

never best replies for state i for any w_i and are chosen with zero probability in equilibrium.

Proof. Suppose to the contrary that in some equilibrium type w_i chooses $\{t', \text{ quit}\}$ where $Q_j(t') > Q_j^-(t')$. State w_i then receives an ex ante expected payoff of

$$Q_j^-(t')v + (Q_j(t') - Q_j^-(t'))((v - a_i(t'))/2) + A_j(t')w_i + (1 - Q_i(t') - A_i(t'))(-a_i(t')).$$

By right continuity of $Q_j(t)$ and $A_j(t)$, the deviation $\{t' + \varepsilon, \text{ quit}\}, \varepsilon > 0$, yields an expected payoff arbitrarily close to

$$Q_i(t')v + A_i(t')w_i + (1 - Q_i(t') - A_i(t'))(-a_i(t'))$$

as ε approaches 0, which is strictly greater than the payoff for $\{t', \text{ quit}\}$. Thus $\{t', \text{ quit}\}$ cannot be a best reply for any type w_i . An identical argument applies for $\{t', \text{ attack}\}$. Q.E.D.

Observation 1 implies that if in some equilibrium t_h is the horizon, it cannot be that both states choose to quit with positive probability at t_h . Further, we can now write state w_i 's equilibrium ex ante expected payoff for $\{t, \text{ quit}\}$ as

$$U_i^q(t, w_i) = Q_i(t)v + A_i(t)w_i + (1 - Q_i(t) - A_i(t))(-a_i(t))$$

and state w_i 's equilibrium ex ante expected payoff for $\{t, \text{ attack}\}\$ as $U_i^a(t, w_i) = Q_i(t)v + (1 - Q_i(t))w_i$.

Observation 2. $U_i^a(t, w_i)$ increases with $Q_i(t)$ for all w_i . Thus in any equilibrium of Γ no type of state i will choose $\{t, attack\}$ (and $A_i(t) = 0$) whenever there exists a t' > t such that $Q_i(t') > Q_i(t)$.

Observation 3. Suppose $t_h>0$ is a horizon in some equilibrium of Γ in which escalation may occur. Then for all $\varepsilon>0$ state i quits with positive probability in the interval $[t_h-\varepsilon,t_h)$ for i=1,2.

Proof. If t_h is a horizon, then by definition at least one state (say, i) must quit with positive probability in the interval $[t_h - \varepsilon, t_h]$ for all $\varepsilon > 0$. I first show that this implies that the same must hold for j. If the contrary is true, then in some equilibrium, there must exist a $t' < t_h$ such that for all $t \ge t'$, $Q_j(t) = Q_j(t')$. By observation 2, $A_j(t) = 0$ for $t < t_h$, so $U_i^q(t, \cdot) = Q_j(t)v + (1 - Q_j(t))(-a_i(t))$ for $t < t_h$. $U_i^q(t, \cdot)$ is strictly decreasing in t whenever $Q_j(t)$ is constant and less than 1, so if the contrary is true and $Q_i(t') < 1$, then no type of i would be willing to choose {t, quit} for any t > t', contradicting the hypothesis that t_h is the horizon. If $Q_i(t' < t_h) = 1$, then $\{t < t', \text{ quit}\}$ is not a best reply for any w_i , implying that $Q_i(t') = 0$. It follows that t' must equal 0— $\{t, \text{ quit}\}$ with $0 < t \le t'$ never being a best reply for any w_i —so escalation does not occur with positive probability, contradicting the hypothesis. Thus both states must quit with positive probability in the interval $[t_h - \varepsilon, t_h]$ for all

By observation 1, there can be no equilibrium in which both states choose $\{t_h$, quit} with positive

probability. Thus in any equilibrium with t_h as the horizon, at least one state (say, i) quits with positive probability in the interval $[t_h - \varepsilon, t_h)$ for all $\varepsilon > 0$. If observation 3 is false, then it must be possible to have an equilibrium in which $Q_i(t)$ is atomic at t_h but j does not quit with positive probability in an interval $[t_h - \delta, t_h)$ for small-enough $\delta > 0$. But then $Q_j(t)$ will be constant and less than 1 for $t \in [t_h - \delta, t_h)$, so by the same logic as in the last paragraph, i will not be willing to choose $\{t, \text{ quit}\}$ with $t \in [t_h - \delta, t_h)$, contradicting the hypothesis.

OBSERVATION 4. Suppose that t_h is the horizon in some equilibrium of Γ . By observations 2 and 3, for j=1,2, $A_j(t)=0$ for $t< t_h$. Thus $\{t>t_h$, attack} yields an ex ante expected payoff of $U_i^a(t,w_i)=Q_j(t_h)v+(1-Q_j(t_h)w_i)$, while $\{t< t_h, quit\}$ yields $U_i^q(t,\cdot)=Q_j(t)v+(1-Q_j(t))(-a_i(t))$. Since $U_i^q(t,\cdot)$ is independent of w_i , for all t such that $\{t, quit\}$ is a best reply for state w_i , $U_i^q(t,\cdot)$ must equal a constant (call it k_i).

Proof of Lemma 1. Suppose to the contrary that there exists an equilibrium of Γ in which escalation may occur and in which $Q_i(t)$ is strictly increasing for all t for some state i. By observation 2, $A_j(t) = 0$ for all $t \ge 0$ (since for all $t \ge 0$ there exists a t' > t such that $Q_i(t') > Q_i(t)$). And, by observation 4, t's equilibrium expected payoff for $\{t, \text{ quit}\}$ is

$$U_i^q(t,\cdot) = Q_i(t)v + (1 - Q_i(t))(-a_i(t)) = k_i$$

implying that

$$Q_j(t) = \frac{k_i + a_i(t)}{v + a_i(t)} (*).$$

However, because $A_i(t) = 0$ for all t, it must be that

$$\lim_{t\to\infty}Q_j(t)=1.$$

From (*), this will be possible only if

$$\lim_{t\to\infty}a_i(t)=\infty$$

or if $k_i = v$, both of which generate contradictions. If

$$\lim_{t\to\infty}a_i(t)=\infty,$$

then no type of i will be willing to choose $\{t, \text{ quit}\}$ for arbitrarily large t, if $\Gamma(t)$ actually occurred. If $k_i = v$, then $Q_j(0) = 1$, implying that j does not escalate with positive probability. Q.E.D

Proof of Lemma 2. Part 1 follows immediately from observations 2 and 3. As for the second part, fix an equilibrium in which escalation may occur and there exists a horizon t_h . Let T_i be the set of times such that for all $t \in T_i$, $Q_i(t)$ is either atomic or strictly increasing. Observations 3 and 4 imply that \tilde{t} 's ex ante expected payoff for $\{t \in T_i$, quit $\}$ is

$$U_i^q(t, \cdot) = Q_j(t)v + (1 - Q_j(t))(-a_i(t))$$

= $Q_j^-(t_h)v + (1 - Q_j^-(t_h))(-a_i(t_h)) = k_i$.

Also from observation 4, type w_i 's ex ante expected payoff for $\{t > t_h$, attack $\}$ is

$$U_i^a(t, w_i) = Q_i(t_h)v + (1 - Q_i(t_h))w_i$$

which is at least as great as $U_i^a(t_h, w_i)$.

There are now two cases to consider. First, if $Q_i^-(t_h)$ = $Q_i(t_h)$, then i's ex ante expected payoff for $\{t < t_h\}$ quit, $t \in T_i$, is $Q_i(t_h)v + (1 - Q_i(t_h))(-a_i(t_h))$, which implies that i does better to choose $\{t \ge t_h$, attack if $w_i > -a_i(t_h)$ and only if $w_i \ge -a_i(t_h)$. Second, if $Q_i^-(t_h)$ $< Q_i(t_h)$, then there exists a $\hat{w}_i < -a_i(t_h)$ such that type \hat{w}_i is indifferent (ex ante) between $\{t > t_h$, attack $\}$ and $\{t < t_h, \text{ quit}\}\$ and thus a measurable set of types $W_i' \equiv$ $(\hat{w}_i, -a_i(\hat{t}_h))$ that strictly prefer $\{t > t_h, \text{ attack}\}$ to $\{t < t_h, t_h\}$ quit}. But this is impossible. The action $\{t > t_h$, attack} yields $Q_j(t_h)v + (1 - Q_j(t_h))w_i$, while $\{t_h + \varepsilon, \text{ quit}\}$ yields $Q_j(t_h)v + A_j(t_h + \varepsilon)w_i + (1 - Q_j(t_h) - A_j(t_h + \varepsilon))(-a_i(t_h + \varepsilon))$. If $A_j(t_h) \neq 1 - Q_j(t_h)$, then for small enough $\varepsilon > 0$, the quit strategy does strictly better for all $w_i \in W_i$. If $A_i(t_h) = 1 - Q_i(t_h)$, then all $t > t_h$ are off the equilibrium path. Condition C implies that for t > t_h , $F_i(-a_i(t); t) = 0$, so $Q_i(t|t_h) = 0$ in all $\Gamma(t)$ for $t > t_h$. But if j will not quit after t_h , then $\{t > t_h$, attack\} cannot be a best reply in the continuation games $\Gamma(t > t_h)$ for types in W_i . Thus $Q_j^-(t_h) < Q_j(t_h)$ is impossible in any equilibrium with $t_h > 0$ as the horizon, and the first case must hold.

Proof of Proposition 1. From lemma 2, it follows that in any equilibrium with horizon $t_h > 0$, the ex ante probability that state j chooses $\{t \ge t_h$, attack $\}$ is $1 - F_j(-a_j(t_h))$. Thus, using observation 3, $U_i^g(t_h - \varepsilon, \cdot)$ can be made arbitrarily close to $F_j(-a_j(t_h))v + (1 - F_j(-a_j(t_h))(-a_i(t_h))$, which, by consequence, must equal k_i .

Choose labels such that $t_2^* \le t_1^*$. I show first that t_h cannot be strictly greater than t_2^* in any equilibrium. If it were, then state 2's payoff for $\{t_h - \varepsilon, \text{quit}\}$ would be $k_2 = F_1(-a_1(t_h))v + (1 - F_1(-a_1(t_h)))(-a_2(t_h)) < 0$, which is impossible. Because $A_1(0) = 0$, state 2 can assure itself at least 0 by the strategy $\{0, \text{quit}\}$, and so state 2 would not be willing to choose $\{t, \text{quit}\}$ for any t > 0, contradicting observation 3.

Nor can t_h be strictly less than t_2^* . If it were, then both states must expect an equilibrium payoff $k_i = F_j(-a_j(t_h))v + (1 - F_j(-a_j(t_h)))(-a_i(t_h)) > 0$ for $\{t < t_h, \text{quit}\}$. Since for $t \in T_i$, $t < t_h$, $k_i = Q_j(t)v + (1 - Q_j(t))(-a_i(t))$, $k_i > 0$ implies that for both states there must exist a $t_i' \geq 0$ such that $Q_j(t)$ is atomic at t_j' and such that $Q_j(t) = 0$ for all $t < t_j'$. If this were not the case, then for one state, $Q_j(t)$ would require types of j to play $\{t$, quit} when this yielded a payoff of 0 or less, which could not be a best reply for any type. Moreover, it must be the case that $t_1' = t_2'$; if not, then for state i with $t_i' < t_j'$, $\{t_i'$, quit} yields a payoff less than or equal to zero. But this contradicts observation 1, since in no equilibrium can both states quit with positive probability at the same time. Thus t_h must equal t_2^* in any equilibrium of Γ and thus, $t^* > 0$ is unique.

Proof of Proposition 2 (Sketch). That the proposed strategies form a Bayesian Nash equilibrium in Γ follows immediately from lemma 2 and the fact that $\mathfrak{D}_j(t)$ is chosen so that all types $w_i < -a_i(t^*)$ are indifferent among $\{t, \text{ quit}\}$ for all $t < t^*$ ($k_1 = u_1(t^*)$ and $k_2 = 0$). For the continuation games $\Gamma(t')$, $t' \geq 0$, Bayes' Rule implies that if $\{F_i, s_i\} \Rightarrow \{Q_i(t), A_i(t)\}$, then

$$Q_{i}(t|t') = \frac{Q_{i}(t) - Q_{i}(t')}{1 - Q_{i}(t') - A_{i}(t')}$$

and

$$A_{i}(t|t') = \frac{A_{i}(t) - A_{i}(t')}{1 - Q_{i}(t') - A_{i}(t')},$$

for t > t' and t' such that $Q_i(t') + A_i(t') < 1$. Notice that when they are defined, $Q_i(t|t')$ and $A_i(t|t')$ are linear transformations of $Q_i(t)$ and $A_i(t)$, respectively. This fact can be used to show that if $\{t, \text{quit}\}$ is a best reply for type w_j given s_i , then it remains so in all continuation games $\Gamma(t' \leq t)$, provided that $Q_i(t') + A_i(t') < 1$ under s_i (and likewise for $\{t', \text{attack}\}$). Thus the strategies given for types given in the proposition form Bayesian Nash equilibria in every continuation game $\Gamma(t')$ up to the earliest time t'' such that for one of the two states, $Q_i(t'') + A_i(t'') = 1$ (if t'' exists). It is straightforward to show that beliefs off the equilibrium path (t > t''), if t'' exists) accord with condition C.

Proof of Proposition 3 (Sketch). By proposition 1, the horizon must be t^* in any equilibrium in which escalation may occur. The only question, then, is whether there are equilibrium distributions on outcomes up to t^* that differ from $\mathfrak{D}_1(t)$ and $\mathfrak{D}_2(t)$. Arguments similar to those for observations 1 and 3 establish that any equilibrium quit distributions must be nonatomic and strictly increasing on $[0, t^*)$. But $\mathfrak{D}_1(t)$ and $\mathfrak{D}_2(t)$ are the only nonatomic strictly increasing distributions that make types $w_i < -a_i(t^*)$ willing to quit at any $t \in [0, t^*)$ and also support t^* as the horizon.

Notes

Presented at the annual meetings of the American Political Science Association, Washington, 1993. Thanks to Atsushi Ishida, Andy Kydd, Robert Powell, Jim Morrow, Matthew Rabin, and Barry Weingast for comments.

Rabin, and Barry Weingast for comments.

1. Studying the "diplomacy of insults," Barry O'Neill (n.d.) independently developed an attrition model of international contests that focuses on this same second feature.

2. For the original discussion of costly signaling in economics, see Spence 1973. On cheap talk (which may be informative in some contexts), see Farrell 1988; Crawford and Sobel 1982; Rabin 1990. The crisis signals discussed herein are atypical in that they create costs that are paid only if the signaler takes a certain future action ("backing down") rather than regardless of what the signaler does in the future (as in Spence's classical case). One implication is that these signals can have a commitment (or "bridge-burning") effect. For a discussion of costly signaling in crises, see Fearon 1992, chaps. 3 and 4, and for the seminal treatment of signaling in international relations, see Jervis 1970.

3. For example, the financial costs of sustained mobilization do not appear as a significant factor in the case studies found in Betts 1987; George and Smoke 1974; Lebow 1981; or Snyder and Diesing 1977.

4. Time preferences or opportunity costs are the main rationale given for the costs of delay in models of buyer-seller bargaining. For an overview of these models, see Fudenberg and Tirole 1991, chap. 10. On time preferences in crisis bargaining, see also Morrow 1989, 949.

5. Schelling's own account views the threat that leaves something to chance primarily as a tactical move available to both sides, rather than as a mechanism for revealing private information about resolve (see Fearon 1992, chap. 3; Maxwell 1968).

6. On the importance of distinguishing between "loss of control" in a crisis due to pure accident and "loss of control" due to unanticipated but deliberate decisions, see Powell 1985

7. Trachtenberg (1991) shows convincingly that the German need to mobilize and attack before Russian mobilization was far advanced was known in both Berlin and St. Petersburg.

8. See the citations in n. 3. I consider how first-strike advantages affect crisis bargaining and escalation in work-in-progress

9. A number of examples from Balkan conflicts are discussed in Fearon 1992, 184–85.

10. According to Norris, "Pitt was conscious that he must negotiate an agreement acceptable to the new parliament when it met in the autumn, or face political annihilation" (1955, 574). The terms that would have been acceptable to the parliament were (intentionally) made harsher by Pitt's public escalation of the crisis. Spain ultimately backed down and Pitt was much praised for his diplomatic triumph.

11. Significant American examples include the heat Acheson took for "losing China" and Johnson's and Nixon's fears about domestic criticism for sending the wrong signal to the communists over Vietnam) (see, e.g., Gelb and Betts 1979, 220–26.

12. Alternatively, domestic audiences may draw harsh inferences about a leader's competence if the leader backs down in a crisis after escalating. If they do, then this would also create an audience cost that would be felt more strongly in democratic states. On the use of incentive schemes to improve an agent's bargaining power, see Katz 1991.

13. For discussion and citations, see Fearon 1992, chap. 3. 14. Nothing important changes if w_1 and w_2 are allowed to

14. Nothing important changes if w_1 and w_2 are allowed to be greater than zero but less than the value of the prize. Also, there is no loss of generality in setting both sides' value for the prize equal to v.

15. Payoffs have been defined except for simultaneous quits or attacks, which do not play much of a role in the sequel. If one state chooses to attack at t and the other chooses to quit or attack at the same time, they receive (w_1, w_2) . If both quit at time t, state i receives $(v - a_i(t))/2$.

The assumption that the winner gets v independent of the amount of escalation makes the analysis more tractable without discarding a key feature of crises that distinguishes them from the classical war of attrition, namely, that only one side pays the costs of escalation if a player quits. The assumption that w_i does not depend on t is also made for tractability; it would be both interesting and desirable to relax it. Discounting is omitted for simplicity and so that I can focus on the independent impact of audience costs.

16. For all values of w_1 and w_2 , there is one other outcome obtainable in a subgame perfect equilibrium, this one involving the play of weakly dominated strategies: both sides choose $\{0, \text{ attack}\}$. If each expects the other to attack immediately, neither has an incentive to deviate. This equilibrium disappears in an alternating-move version of the game. If the two states would be locked in at the same time, then there are three equilibrium outcomes (beyond the weakly dominated one): either one of the two states quits immediately or both play a mixed strategy up to the lock in time.

17. I have omitted proofs of the comparative statics results. These are available on request, along with less-compressed versions of the proofs given here.

- 18. I assume also that f_1 and f_2 are independent, which is most naturally interpreted to mean that uncertainty is about the opponent's cost-benefit ratio for war rather than about military capability. For a discussion of this issue, see Fearon
- 19. This interpretation of $u_i(t_h)$ as i's expected utility for $\{t_h, t_h\}$ quit} is valid only if i neither quits nor attacks with positive probability at t_h , but the proofs do not depend on the interpretation.

20. If they cannot (e.g., if $a_1(t) = a_2(t) = 0$ for all t), then there may not exist an equilibrium in which learning occurs.

21. In the linear case, as the audience-cost rates a_1 and a_2 approach zero, the horizon time t* approaches infinity, meaning that an arbitrarily large amount of delay or escalation is required to credibly signal willingness to fight.

22. In formal terms, the probability that state 1 will back down prior to the horizon time is $a_2t^*/(v + a_2t^*)$. The probability that state 2 will do the same, conditional on the crisis occurring (i.e., lasting longer than t = 0), is $a_1 t^* / (v + a_1 t^*)$. Thus if $a_1 > a_2$, state 2 is more likely to back down than state 1, and vice versa. This result holds for any precrisis beliefs, f_1 and f_2 .

23. The probability that state i will fight conditional on a crisis occurring is $v/(v + a_i t^*)$, $j \neq i$, and t^* proves to rise as a_i

falls, implying the result in the text.

24. In the Cold War period the Soviet Union appeared generally more willing than the United States to threaten the use of military force and then back off or moderate on meeting resistance. This, at any rate, is a reading consistent with standard interpretations of the set of major Cold War crises (e.g., Betts 1987; George and Smoke 1974; and Snyder and Diesing 1977). Certainly the United States has used force on many occasions in Latin America and elsewhere, but military probes to gauge other parties' willingness to resist appear uncommon. Maoz and Russett (1992, 253) report that 62% of 271 post-1945 crises between democracies and "autocracies" were initiated by the autocracy—a number that would extremely unlikely to occur if democracies were just as likely to try military probes.

25. Relevant other things will not be equal if democratic leaders tend to have higher (audience) costs for fighting wars than do nondemocratic regimes. Indeed, the same argument that suggests that democratic leaders will suffer more politically for backing down after escalating a crisis suggests that they will be more sensitive to potential war costs. In the model, crises are less likely to escalate to war the greater are the states' costs for fighting (or, equivalently, the lower v).

26. When the distribution of w_1 is logistic up to $w_1 = 0$, the probability of war given a crisis (Pr(war|crisis)) increases as a_1 increases above a_2 whenever the median value of w_1 is sufficiently low. For example, let $F_1(z) = (1 + \exp(-z - m))^{-1}$ for z < 0, and $F_1(0) = 1$. If v = 1, then the result holds whenever m > 1, which means that the typical state 1 is not willing to run 50% risk of war for the prize. Ultimately, for highly asymmetric situations (very large a_1 , very small a_2), Pr(war|crisis) begins to decrease with a_1 in the logistic case. For instance, if v = 1 and m = 5, Pr(war|crisis) is .045 when a_1 = a_2 , and reaches a maximum at .11 when a_1 is about 50 times greater than a_2 .

27. The probability that state 2 backs down at t = 0 is k_1/v . A shift in the balance of power (understood as the probability that 1 would win a war) shifts f_1 to the right and f_2 to the left; this has the consequence of increasing k_1 . An increase in the intensity of state 1's interests at stake shifts f_1 to the right (without affecting f_2), which also has the consequence of

increasing k_1 .

28. An important limitation of the attrition model of crises (a limitation common to most other models of "crisis bargaining") is that it gives states only two ways to resolve a dispute peacefully: one side or the other must "back down." While some evidence suggests that many crises in fact have this aspect (Snyder and Diesing 1977, 248), we would like to know why. A natural next step is to consider models with continuous-offer bargaining (e.g. Fearon 1993; Powell 1993).

29. There is in fact a large set of different arguments

lumped under the "security dilemma" heading, but this criticism cannot be pursued here. For a critique of standard 'security dilemma" reasoning, see Kydd 1993.

30. Schweller (1992) provides some evidence suggesting that democracies neither engage in nor are the targets of preventive war. Fearon (1993) shows that between rationally led states, preventive war arises from the rising power's inability to commit not to exploit the future bargaining advantage it will have.

31. A similar argument about alliances is developed by Gaubatz (1992), who presents evidence indicating that alliances between democracies last longer than alliances involv-

ing nondemocracies. See also Fearon 1992, 355

32. The refinement is in the spirit of Cho and Kreps (1987) D1 criterion. Even without the refinement, comparative statics results are only marginally weakened for the set of perfect Baysian equilibria of Γ.

PEACE, WAR, AND THE BALANCE OF POWER

R. HARRISON WAGNER University of Texas, Austin

Levery possible relation between the distribution of power and the likelihood of war has been defended somewhere in the literature on international politics: war is least likely if power is distributed equally, war is least likely if power is distributed unequally, and the distribution of power has no effect on the likelihood of war. I try to settle this dispute by examining the effect of expectations about the outcome of war on the choice between war and negotiation. I argue that each of these mutually contradictory propositions can be derived from some plausible set of premises and thus that which one is correct depends on which set of premises best describes a situation. The most important factors affecting the relation between the distribution of power and the likelihood of war are (1) whether the terms of a compromise agreement that might be accepted in lieu of war affect the distribution of power between the antagonists and therefore the probability that the agreement will be enforced and (2) how many states' interests will be affected by the outcome.

The change in the distribution of power caused by the collapse of the Soviet Union has led to renewed interest in the relation between the global distribution of power and the likelihood of war. More recently, there has been controversy about whether increasing the military strength of the Bosnian forces in the Yugoslavian civil war would make a settlement of that conflict more likely. Unfortunately, the literature on international politics is not much help in thinking about questions such as these, since every possible relation between the distribution of power and the likelihood of war has been defended somewhere in it: war is least likely if power is distributed equally (Claude 1962, 56-66); war is least likely if power is distributed unequally (Blainey 1988, 108-24; Organski 1958, 292-93); and the distribution of power has no effect on the likelihood of war (Wittman 1979, 749-51). Moreover, the empirical literature on this subject is equally divided.1

Because the arguments that have been offered in support of these contradictory propositions have often been incomplete and intuitive, it seems plausible that the cause of this disagreement has been sloppy reasoning and that the right answer can be found by being more careful about what conclusions follow from what premises. One might therefore be tempted to believe that if one of these propositions can be derived from a formal model it must be true and the others false. I will argue that such an inference would be wrong. I will show how each of these contradictory propositions can be derived from some plausible set of premises and therefore argue that the answer to the question depends on which premises best describe a situation.

Any formal model supporting one or another of these contradictory propositions would be complex. I cannot here fully develop several formal models to illustrate the implications of various alternative sets of assumptions and then compare them. I shall therefore merely sketch several lines of argument that

could provide the basis for the construction of formal models, referring the reader to examples in the literature whenever possible. Formal theorists will find this insufficiently rigorous. My excuse is that in this case one must choose between generality and rigor, and some rigorous models in the literature have made unwarranted claims to generality.

First, I shall summarize the reasons that scholars have given in support of each of the various possible relations between the distribution of power and the likelihood of war. I will argue that the sources of their disagreement lie in the degree to which they treat attackers and defenders symmetrically, the assumptions they make about the relation between the balance of forces and the expectations of decision makers, and the assumptions they make about the alternative to war. While they differ in these respects, however, all writers on this subject tend to assume that any conclusions that one might draw about the effects of the distribution of power in a world of two states also hold true in a world of more than two states. Subsequently, I shall consider what justification there is for any of the assumptions these writers have made. I will begin by examining the relation between fighting and negotiating in a world of two states and then examine the effect of adding more states.

The main conclusion is that the most important factor affecting the relation between the distribution of power and the likelihood of war is whether the terms of a compromise agreement that might be accepted in lieu of war affect the relative power of the antagonists and therefore the probability that the agreement will be enforced. If they do, then a second important factor is the number of states whose interests will be affected by the outcome. Thus the answer to the question of what relation one should expect between the distribution of power and the likelihood of war is, "It depends." The point of the analysis is to try to make clear what it depends on.

THE SOURCES OF DISAGREEMENT

The idea that war is least likely if power is distributed equally seems so obvious to many people that it is rare that anyone feels the need to justify it. However, it is clearly based in part on two assumptions: (1) the less likely a state is to be successful, the less likely it is to start a war; and (2) the smaller a state's military forces are relative to its adversary's, the less likely it is to be successful. If one state is known to have no incentive to use force even if it expected to be successful, these assumptions imply that the likelihood of war could be minimized by making that state as powerful as possible relative to its potential adversaries. But since there is no reliable way of knowing which states, if any, will never be tempted to use force, most writers assume that all states are equally likely to contemplate the use of force if the prospects of success are favorable. Many people infer from these assumptions that the probability that either of two potential adversaries will start a war must be least when their forces are equal (see, e.g., Claude 1962, 56; Mearsheimer 1991, 154).²

However, if we assume (as is commonly done) that there are only two possible outcomes of war (i.e., one state wins or the other does), then this conclusion does not follow from these premises. Since the distribution of power between two potential combatants affects the probability of success for both and the probabilities of success must sum to one, decreasing one state's probability of success must increase the other's by the same amount. Thus it is not clear why any decrease in the first state's incentive to use force should not increase the other's by the same amount, leaving the probability of war unchanged. If so, the distribution of power would be unrelated to the probability of war.

The simplest (but not the only possible) answer to this objection is that there are three possible outcomes of war, not just two: one or the other side wins, or there is a stalemate. The probability that the war will end in stalemate is greatest when the forces of the two sides are equal. In that case the sum of the probabilities that each state will win is least when their forces are equal. Note, however, that while the probability that either state will use force may, as a result, be least in this situation, both states may still have an incentive to use force that is uncomfortably large.

This reasoning assumes that wars are caused by the states that initiate them, so that one has only to examine the incentives of aggressors to estimate the probability of war. One justification for the claim that inequality of power minimizes the probability of war is based on the fact that it takes at least two states to make a war and assumes that the reasoning just applied to attackers also applies to defenders. If states that are unlikely to be successful are unlikely to use force, then weak defenders are least likely to resist an attack. And if defenders do not resist the demands of aggressors, then wars will not occur (Organski 1958, 292–93). Thus the greater the inequality of power, the

less the probability of war. This reasoning implies that if the likelihood of war is to be minimized, not every state can expect to be able to defend its interests.³

However, this argument only implies that given an attack, the probability that it will lead to war is less, the greater the superiority of the attacker. But the previous argument implies that the probability of an attack is least, the more nearly equal the two side's forces are. Thus the two together imply that the probability of war is greatest for distributions somewhere between equality and great inequality. To get the conclusion that the probability of war is minimized by inequality, one must show that there is some degree of inequality such that the probability that the victim of an attack will resist is smaller than the probability that a state will choose to attack when their forces are equal. But if defenders must choose between fighting against a superior force and capitulation, they may be willing to fight even if the chances of success are very small. Therefore, the degree of inequality that would be necessary to minimize the probability of war might have to be very great indeed.

However, because war is costly and its outcome uncertain, there ought to be some negotiated settlement that both sides would prefer to the costly lottery associated with war-in which case, the alternative to war will be not capitulation but a negotiated settlement. But then, since the value of any proposed agreement must be compared to the expected value of going to war, the minimum terms that each side will accept will be influenced by how optimistic it is about the outcome of war. Since the balance of power (i.e., the relative size of each side's military forces) influences the expected outcome of war, it influences the minimum terms that each will accept. But if a change in the balance of power makes one state more optimistic about the outcome of war and therefore leads it to increase its demands, it must make the other more pessimistic and therefore willing to accept a less favorable settlement. This is the basis for the claim that a change in the balance of power affects the terms of the settlement that states would accept as an alternative to war but not the probability that war will occur (Fearon 1992; Wittman 1979, 749-51).

But this reasoning assumes that decision makers' expectations about the outcome of war are consistent. If they are not and both sides are optimistic about the outcome, then there may be no negotiated settlement that they both prefer to war (Wittman 1979, 755–57). This provides another justification for the view that war is least likely when power is distributed unequally: Blainey (1988) claims that it is more likely that both antagonists will be optimistic when power is distributed equally than when it is distributed unequally and therefore that states are most likely to be able to agree on a negotiated settlement as an alternative to war when power is distributed unequally. According to Blainey, this explains why wars can be ended by negotiations even though negotiations failed to prevent them. 4 However, Blainey does not make clear why there should be a relation between the distribution of power and the consistency of two states' expectations concerning the outcome of

a possible war between them.

These conflicting lines of argument raise two fundamental questions: (1) Is a negotiated settlement always available as an alternative to war? and (2) If a negotiated settlement is available, how does the relative military power of the adversaries affect their choice between war and negotiation? I shall focus on the second question first. To answer it we must examine the relation between fighting and negotiating.

FIGHTING AND NEGOTIATING

Although war and negotiation are usually presented as alternatives to each other, I shall claim that war is best understood as part of a process of negotiation. Thus, while adversaries can certainly choose to negotiate rather than fight, if they fight it is because each sees fighting as a way to influence the outcome of negotiations. The place to begin, therefore, is not with an examination of war but with an examination of bargaining.

Bargaining

The essential feature of bargaining is that two or more actors will be better off if they coordinate their actions than if they do not but that they have conflicting preferences as to which actions are to be selected from some larger feasible set. The paradigmatic example is two people who can divide a sum of money between them if and only if they agree on how it is to be divided. If each of them is interested only in receiving the largest possible amount of money, then what each will be willing to accept will depend on his expectation of what the other is willing to accept. This is the sort of problem that game theory is supposed to help us analyze. It has proved, however, to be extraordinarily resistant to analysis. The purpose of most discussions of bargaining is to defend one or another solution to this problem. However, the question of what agreement rational bargainers will accept is less relevant to understanding why states prefer fighting to negotiating than the question of how long it will take them to accept it, a question that most bargaining theory has little to say about. Thus it may be more relevant to emphasize why what is commonly called "the bargaining problem" is such a hard problem.

Consider, then, two people in a room discussing what agreement they will sign, and suppose one of them demands 90% of the money. This may seem outrageous to the other, but if that is the only agreement the person making this demand is willing to accept, then the only rational choice is for the other to accept it, since 10% of the money is better than nothing. But this reasoning applies to either bargainer. Suppose, then, both demand 90% of the money. Then they will get nothing unless one or the other changes his demand. But which should it be?

Suppose after they have been deadlocked for a while one of them considers whether to give in. After all, deadlock could last forever, and it seems reasonable that both bargainers would prefer to accept something now to getting some larger sum later. But precisely because this is true of both, it is as good a reason for either to decide to wait for the other to give in as it is a reason to give in oneself. And this remains true no matter how long they have been deadlocked: if the other is about to give in, it is better to wait for his concession than to give in to him unnecessarily, no matter how much time has already passed.

Consider now the possibility of offering to accept a compromise instead. By conceding some of what the other is demanding, one reduces the potential gain to him of holding out for more: the difference between 90% and 50%, for example, is much less than the difference between 90% and 10%. Perhaps, then, a concession will lead to agreement. However, if the other expects the first concession to be followed quickly by another, then he may reason that while the potential reward to stubbornness has diminished, the probability of getting the reward has increased. Thus a concession may simply make the other more recalcitrant rather than less. But instead of offering further concessions, the bargainer who made the first one may decide that it had the wrong effect and offer no more.

The reason it is difficult to say what individuals should do in an unstructured face-to-face bargaining situation such as this is that every possible division of the money is supported not just by an equilibrium combination of strategies but by a sequentially rational equilibrium. There are two ways of circumventing this indeterminacy: one can extend the definition of rational behavior to include a variety of intuitions as to how a rational person should respond to it, or one can impose some further structure on the situation, (e.g., by requiring the bargainers to communicate offers to each other only in a certain order and at certain fixed intervals).5 However, any solution that is based on understanding the independent choices of the two bargainers must specify a bargaining strategy for both such that given the behavior specified by the strategy, at the time of the predicted agreement neither bargainer could expect to gain by waiting instead of accepting the prescribed agreement. But since the effect of waiting depends on how the other bargainer responds to it, it must be common knowledge that the prescribed solution is sequentially rational and therefore the value the bargainers place on agreements *now* relative to agreements *later* must also be common knowledge. Thus it is not surprising that two bargainers will often both be optimistic about the effect of holding out for better terms, and it seems entirely possible that even rational bargainers with a good understanding of the problem might take so long to reach an agreement that, had they anticipated the outcome, they both would have preferred to accept the other's offer at the outset.6

Bargaining and Fighting

Now suppose that one bargainer grabs the other's arm and twists it painfully behind him while demanding that he give in. Because this has the effect of increasing the cost of disagreement for the victim, standard solutions to the bargaining problem imply that this ought to worsen the terms of the bargain that he ultimately accepts. Note, however, that while this assault may mean that the victim is willing to surrender all the money to the other bargainer, it does not necessarily mean that. While the costs of disagreement are now much greater for the victim than for the attacker, the attacker presumably still (as before) prefers an agreement now to an agreement later and might therefore be willing to agree to less than everything in order to shorten the time to agreement. In other words, this assault may not deprive the victim of all bargaining power. This is because the one who is twisting the other's arm still requires the cooperation of his victim. If not (e.g., if he can simply take the other's money once he is no longer able to resist), then by disabling the other he can take everything.

Perhaps, however, the victim of this maneuver can evade the other's grip and retaliate. If he succeeds in twisting the arm of the first, then the bargaining advantage shifts to him. If not, then a struggle may ensue. At every moment during this struggle there are three possibilities: either bargainer may succeed in pinning the other down, or the struggle may continue. The struggle itself is unpleasant, however, and therefore either bargainer may decide he prefers to offer a compromise in hope that the other will agree and they can quit. Perhaps they might pause in their struggle to consider further offers and counteroffers, or perhaps they might continue to communicate while struggling. Either way, they must, as before, evaluate the terms of any possible offer relative to the possibility of doing better by holding out. However, the value of holding out has now become rather complex. It must include an evaluation of the unpleasantness associated with the struggle, an estimate of how long it might last, an estimate of the probability that either might ultimately emerge as victor, an estimate of the value of each of the possible agreements that might be accepted in the event that either won the struggle, along with the probability associated with each, and an estimate of the range of possible agreements that the other might accept later in the struggle along with the probability associated with each and how long it would take before the other was willing to accept them. Therefore there are now two reasons why bargaining may take so long as to be self-defeating: each can continue to be optimistic that the other will soon tire of the contest and offer a concession, and each can continue to be optimistic that he will soon defeat the other and gain an important bargaining advantage.

Moreover, the use of force adds a qualitatively different element to this situation. Suppose our two bargainers have struggled inconclusively for a while and that one offers a compromise based on his expectation of the consequences of continuing the struggle. If he releases his grip in response to the other's apparent agreement, this may allow the other bargainer to grab him in a hold he would be unable to break and compel him to accept a much worse agreement than the one he offered. Thus, because no one can compel a bargainer not to renege on an offer he has made, once the struggle has begun, neither bargainer may be willing to consider a compromise until its outcome has been decided.

This rather fanciful story about a wrestling match began with one bargainer trying to seize the other in a painful grip in order to force him to agree to a deal that was less favorable to him (and therefore more favorable to the attacker). Before attacking his fellow bargainer, however, he could merely threaten to do it, and the other could then threaten to retaliate in kind. They could then make demands and counterdemands of each other based on those threats. Since no one would have tackled anyone at that point, however, it is possible to doubt that anyone would or that if one did, the other would actually resist. Moreover, even if he did resist and were successful in avoiding being pinned down, he might quickly offer a compromise settlement. Thus each bargainer must choose between accepting some proposed agreement and using force to try to extract a better one. If they both decide to use force, this is not because they have decided not to bargain but because they believe fighting will improve their bargaining position.

Each bargainer's expectations of the consequences of rejecting any particular proposal can be divided into two categories: expectations about the outcome of bargaining in various possible circumstances (including the outright victory of one or the other bargainer) and expectations about the outcome of a fight. How many possible outcomes of a fight are there? One plausible answer is that there are three: one or the other loses, or there is a stalemate. Thus expectations should take the form of a probability distribution over these three possibilities. However, one could argue that no stalemate could last foreverthat one or the other would eventually tire and have to submit, though this might take a long time. In that case, one might want to say that there are only two possible outcomes: one wins, or the other does. But if they care about how long it takes for one to win (as surely they would), then we would have to say that there are infinitely many possible outcomes: a victory for one or the other at every possible time at which it might occur.

In thinking of their expectations concerning the outcome of fighting, one must distinguish between how uncertain they are and how consistent their expectations are. They are maximally uncertain if they believe all possible outcomes are equally likely. Their expectations are consistent, however, only if the probability they each assign to every outcome is the same. If they are both maximally uncertain, then their expectations must necessarily be consistent. If not and if each has private information relevant to

estimating the probability of the outcome, then their expectations may be inconsistent.

We began by assuming that these two people were bargaining over the division of a sum of money. Before force was introduced into the story, this money would have to be a potential addition to the wealth of each bargainer, so that the cost of failing to agree was simply that they would fail to gain anything. Once force is introduced, however, this is no longer true, since either might be willing to surrender money he already possessed to avoid further physical punishment, and the cost of failing to agree is continuation of this punishment (if bargaining takes place after fighting begins) or the possibility that one may be subjected to this punishment (if bargaining takes place before fighting begins). The distribution that exists prior to bargaining is one possible outcome of bargaining but not the only one, even if an agreement is reached without fighting. Thus whether these people can avoid fighting and whether they can both protect the assets they had at the outset are two different questions.

Suppose now that it is common knowledge that in the event force is used, one would quickly subdue the other (perhaps because he is a muscular athlete while the other is an uncoordinated wimp). Should they then be able to reach an agreement without the need to use force? If so, they must both prefer the expected value of bargaining prior to the use of force to the expected value of first fighting and then bargaining. If they have sufficiently conflicting expectations of the outcome of bargaining after fighting this may not be true, since by resisting when he has no chance of success one bargainer might be able to influence the other's expectation of how stubborn he would be once the struggle was over.7 Thus their ability to reach agreement without fighting depends on how consistent their expectations are of the outcome of

bargaining after the fighting is over.

Now suppose that they appear to be very evenly matched physically but that one has a black belt in karate. If this were commonly known, it would give that person a bargaining advantage. Precisely for this reason, however, if it is not commonly known then the other has good reason not to believe any claims to this effect. Thus, because the factors that are commonly known are evenly balanced, private information may lead to inconsistent estimates of the probability that each will win. But their ability to reach agreement without fighting depends on their having consistent expectations of the outcome of the bargaining that will take place once the fight is over, and this will be impossible if they have inconsistent expectations of the outcome of fighting. Thus, even if they have consistent expectations of the outcome of bargaining in the event that either won, inconsistent estimates of the probability that either will win may imply that there is no agreement prior to the use of force that they both prefer to fighting.

Even without introducing karate into the story, it is possible that because the two are evenly matched they expect that a struggle would be long and arduous, and therefore that each might believe that the other is likely to make a concession long before it is over. Thus, as long as fighting can be interspersed with negotiations, private information about each other's evaluation of the struggle itself can lead both of them to be optimistic about the outcome of fighting, even though it is common knowledge that a struggle fought to a decision would be long and costly for both sides. Therefore anyone who reasons that simply because they were evenly matched physically the prospect of a long and costly struggle would deter them from fighting must implicitly assume that once the fight began it could not be interrupted until one or the other had been defeated.

War and Negotiation

Since wars are fought by collectivities, a war's costs and benefits will fall differently on different individuals, who will therefore have different interests even if they have identical expectations—and they are very unlikely to have identical expectations. Thus wars give rise to intense internal conflicts whose pursuit can influence the course of the war. If we ignore this complication (as the literature on the balance of power does), then I shall claim there is a very close parallel between the story just told and interstate war.

Conventional interstate war is a contest in which each side tries to disarm the other in order to acquire the bargaining advantage to be derived from the unopposed use of force. In the limit, of course, force can be used to destroy one's adversary completely. Usually, however, the winner of a military contest requires the cooperation of its defeated enemy in order to accomplish its aims.8 Thus "victory" and "defeat" refer to the outcome of the clash between armed forces, not to the political objectives that motivated the conflict.9

Military contests may lead not to the defeat of one side or the other, however, but to stalemate. Fighting may last for a long time before it becomes common knowledge that a stalemate exists. But even if stalemate is commonly expected at the outset, the fact that fighting is costly means that it may be possible to derive a bargaining advantage from imposing those costs on the enemy, even though doing so requires subjecting oneself to costs as well. Thus one cannot assume (as many do) that a simple probability distribution over the two outcomes of victory and defeat is an adequate way of representing states' incentives to use force or that a belief that stalemate is the most likely outcome is sufficient to deter its use. 10

Wars, therefore, are contests in the use of force that are meant to induce one's opponent to agree to something. If the adversaries have inconsistent expectations of the outcome of bargaining after fighting, they are unlikely to be able to reach an agreement without fighting. And if they have inconsistent expectations of the outcome of fighting, they are unlikely to have consistent expectations of the outcome of the bargaining that will follow.

There are a variety of factors that are relevant to

estimating the outcome of fighting, including the relative sizes of the opposing forces, the nature of the weapons systems available, the ability of the antagonists to mobilize resources to replace those which are lost in combat, the skill of the opposing forces, the strategies to be employed, and so on. The state of some of these factors (e.g., the size of the opposing forces and the economic base that supports them) is public knowledge. However, information about other factors (e.g., the strategy to be employed) is not public, either because states try to keep them secret or because they have an incentive to mislead their adversaries when they publicize them. The greater the role of factors that decision makers have private information about, the greater the likelihood that their estimates of the outcome of war will be inconsistent. And the more nearly equal the publicly known factors are, the greater the role of factors about which the antagonists have private information. Hence it is most likely that both sides will feel optimistic when the balance of power is approximately equal and that their expectations will be consistent when their power is unequal. This reasoning therefore supports Blainey's claim that conventional war is least likely when power is distributed unequally between the potential combatants.¹¹

However, in comparing the choice between war and negotiation with a situation in which two individuals were struggling over the division of a sum of money, I implicitly assumed that agreements were enforceable (even if offers made while struggling were not). I also assumed that there was no relation between wealth and bargaining power. But agreements between states must be self-enforcing, and the correlation between wealth and power is an important feature of international conflict. This means not only that the wealthiest states are likely to be the strongest states but also that states can become stronger by defeating other states and acquiring their resources. Thus, the outcome of one contest can influence the expected outcome of subsequent contests, so that compromise agreements may not be enforceable.

To see why, suppose that two states are considering an agreement to redistribute resources as an alternative to fighting. The range of agreements they both would prefer to fighting depends on their expectations of the outcome of the fight. But if redistributing resources from one to the other worsens the expectations of the first and improves the expectations of the second, then after the redistribution the one who benefited from it may be able to enforce a demand for more. If so, the first agreement is not enforceable and therefore not really available. 12 In that case war can be avoided only if each side prefers the existing distribution to the present value of the distribution that it expects would be agreed to after one or the other was defeated or if one side is sufficiently pessimistic about the outcome of fighting that it prefers to accept defeat in advance. 13 This implies, as we have seen, that war is most likely if the balance is neither equal nor very unequal.

Moreover, states may prefer fighting to negotiating in these circumstances even if their expectations of the outcome of both fighting and negotiating are consistent. Blainey wrote: "When nations prepare to fight one another, they have contradictory expectations of the likely duration and outcome of the war. When those predictions, however, cease to be contradictory, the war is almost certain to end" (1988, 293-94). If compromise agreements are not enforceable, however, states may fight not because their expectations are inconsistent but because they are both sufficiently uncertain of the outcome of war to prefer it to defeat or the status quo. The war ends, therefore, not when the adversaries' expectations become consistent (since they may have been consistent at the outset) but when the ultimate outcome becomes nearly certain.

We have identified, then, two plausible lines of reasoning about the relation between the distribution of power and the likelihood of war. One leads to the conclusion that (other things being equal) there is an inverse linear relationship between inequality of power and the probability of war, since the more unequal the balance of forces, the more consistent adversaries' expectations of the outcome of a military contest will be and therefore (other things being equal) the more likely it is that they will be able to agree on the terms of a settlement as an alternative to war. The other leads to the conclusion that the relation between the distribution of power and the probability of war is nonlinear, since the probability of war is greatest for distributions somewhere between equality and great inequality; however, power has to be very unequal for the probability of war to be lower than it is when it is distributed equally. The crucial difference between these two arguments concerns the enforceability of agreements: the first assumes that all possible compromise agreements are enforceable, and the second assumes that compromise agreements are not enforceable and that therefore adversaries must choose between the status quo and negotiating after one side or the other has been defeated on the battlefield.

Note that both arguments are ceteris paribus arguments, and thus in practice any effect of a change in the distribution of power on the probability of war could be swamped by the influence of other factors. Note also that both assume (implausibly) that any two potential adversaries are equally likely to decide to use force to upset the status quo when faced with the same probability of military success. If instead one state prefers the status quo to any alternative regardless of the distribution of power, both lines of argument imply that the probability of war is least when that state's relative power is maximized.

Both these arguments also assume that only two states are in conflict with each other. However, wars are fought not just by individual states but by coalitions, so that the distribution of power between military antagonists depends not just on the power of individual states but also on which states decide to fight. We must therefore consider how this affects the

relation between the distribution of power and the likelihood of war.

ALLIANCES, THE DISTRIBUTION OF POWER, AND WAR

Let us continue to assume, following the previous discussion, that states have resources such as wealth, territory, population, and technology that are assets in fighting wars. Using their knowledge of the assets of potential adversaries, statesmen estimate the likelihood of the outcomes of wars between them. Because the outcomes of wars are also affected by factors that are not common knowledge, their probability estimates may not be consistent. However, given any two potential military antagonists, the more unequal they are with respect to their publicly known assets, the more consistent everyone's expectations will be. But now let us also assume that there are more than two states and that the assets of states can be combined, so that wars can be fought between coalitions as well as individual states.

We have seen that because assets such as wealth, territory, and population lead to military power, gains derived from either the actual or threatened use of force may be cumulative, so that any particular pair of adversaries must consider the effect of some proposed redistribution of these assets on the expected outcome of subsequent conflicts between them. When there are more than two states, this fact also implies that even allies must consider the effect of any redistribution on the expected outcome of subsequent conflicts in which they may be adversaries, and states that do not participate in a conflict must consider the effect of its outcome on some subsequent conflict they might have with one or another of the participants. Controversies about the implications of these facts are the central focus of the literature on the balance of power.

In examining their implications for the relation between the distribution of power and the probability of war, it will be convenient to assume that all the commonly known assets of a state that are relevant to predicting the military outcomes of wars it might engage in can be summarized in a single index represented by a real number, r (for "resources"). Using their knowledge of the distribution of these resources, together with any private information they may have, statesmen estimate the likelihood of the outcomes of wars fought between various possible combinations of states. (When states form alliances, the military resources available to the alliance are simply the sum of the resources of the member states.) Let us also assume that wars lead to one of three possible military outcomes: one or the other side's armed forces win, or there is a military stale-

Some recent game-theoretic models designed to investigate the stability of international systems have been based on such assumptions. However, these models have also made a very simple and unrealistic assumption about the relation between the distribution of power and the outcomes of wars: if $r_i > r_j$, then it is common knowledge that the probability that i will win a war with j is 1.0, and winning the war will give i control over all of j's resources; whereas if $r_i = r_j$, it is common knowledge that the probability of stalemate is 1.0, and a stalemate implies that no resources are redistributed (Niou and Ordeshook 1990; Niou, Ordeshook, and Rose 1989; Wagner 1986). With these assumptions, of course, states may or may not be eliminated (which is the question of system stability) but wars will occur only if negotiation is impossible, since there is neither uncertainty nor private information.

Nonetheless, these models are relevant to our problem, since one of the possible consequences of wars is the elimination of the defeated state or states and the absorption of their resources by the victors and since this fact will affect the incentive of states to participate in wars. Suppose, for example, that two states absorb all the resources of a third. This transfer will not be permanent if, as a result of it, one of the victors is then able to force its former ally to surrender its resources. Consider, then, a system of three states in which the resources are distributed 150, 100, 50. Then the assumptions just stated imply that if the largest state acquires any more resources it will be able subsequently to defeat both the other two. Thus neither of the other states will ally with it, and each will come to the aid of the other if it is attacked by it. Moreover, neither of the smaller states will attack the other, since doing so would allow the largest state to join the attack and gain resources. Therefore no transfers can take place in this situation, and the system is stable. 14

Suppose, on the other hand, that resources are distributed 100, 100, 100. Then a coalition of any two states can defeat the third, but will it absorb all its resources? Perhaps it will, if the resources of the defeated state are divided equally between them, leading to the distribution (150, 150). In that case, the system is not stable. However, such an agreement would not be enforceable, and nothing prevents either ally from trying to cheat and acquire more. If it does, then the other can only protect itself from this defection by switching to the side of the victim before it is eliminated. 15 And even if this fails to occur, the enemy is defeated, and the distribution (150, 150) is implemented, any exogenous change in either side's resource endowment (perhaps by economic growth) would leave the other unable to avoid defeat. Thus neither of the victorious states would want to eliminate the defeated state entirely. Either or both these possibilities would imply that the victim, while it might lose resources, would not be eliminated, which provides a justification for a "hidden hand" interpretation of the idea of the balance of power: in a system of more than two states, the balance of power will protect the independence of states even if all states seek to expand at the expense of others.¹⁶

With this conclusion in mind, consider again the

distribution (100, 100, 100). In this situation each state is exposed to the possibility that the other two will form a coalition and attack it. On the other hand, any two of them can secure themselves from attack by attacking the third and absorbing its resources until one of them has 150 units, which freezes the system and makes further transfers impossible. Thus there is a strong incentive for expansion even for states that have no interest in acquiring more resources.

This reasoning implies that three-member international systems are stable. But this conclusion implies in turn that five-member systems may not be, for if two states in a five-member system are strong enough to defeat any combination of other states, then they can eliminate two other actors and stabilize their winnings in a three-actor system. The traditional literature on the balance of power focuses on the need for states to ally against a potential hegemon, that is, a state that is on the verge of being able to defeat any combination of other states. In systems with more than three states, however, this reasoning implies that hegemonic coalitions are also a danger.

These conclusions rest on the assumption that the outcome of wars can be anticipated with certainty and that they are common knowledge. It we assume, more plausibly, that knowledge of the distribution of resources between potential adversaries leads to nonzero probability estimates for all the possible outcomes of war and that these probability estimates may not be consistent, then the incentive for coalitions to form in opposition to potentially hegemonic states or coalitions remains, but much else is altered.17 Uncertainty about outcomes implies that in every military conflict, each side faces some probability of defeat, though this probability can be diminished by increasing the resources on one's own side. In a world of two states, of course, each side can increase the quantity of resources available for military use by reallocating them from other uses; but a state's initial resource endowment (and its capacity for mobilization) implies that there is some upper limit to the quantity of resources it can devote to conflict. Alliances enable states to circumvent this limitation if other countries are willing to cooperate. Uncertainty about what other states will do, however, will lead to uncertainty about the strength of each side, and thus add to the uncertainty that already exists about the outcome of war.

Consider again the distribution (100, 100, 100), for example, and suppose the first two states combine to attack the third. With no uncertainty about the outcome of war, if their attack led to a distribution such as (150, 140, 10) then their gains would be secure, since the largest state could not defeat the other two combined and neither of the other two would allow the other to be attacked without coming to its assistance. With uncertainty, however, the second-biggest state may decide that such a distribution would lead to too great a risk of defeat by the most powerful state. Therefore the second state may want to leave the third stronger than it otherwise would, in order to reduce the threat that its own ally would subse-

quently pose. However, there is nothing to guarantee that the other states would agree either with its probability estimates or with its attitude toward risk. Suppose that war led to a distribution such as (140, 140, 20). Then, instead of being supported by the third state in an alliance against the first with a comfortable margin of superiority, the second state might find itself faced with a hostile alliance between the first and third states. In order to avoid this outcome, it might therefore agree to allow the first state to make greater gains at the expense of the enemy. This would increase the likelihood of postwar assistance from the third state in any military conflict with the former ally, but at the price of a smaller chance of winning in case such a conflict occurs.

Thus uncertainty implies that states face a dilemma in trying to secure the fruits of military victory. Maximizing security requires maximizing the power of whatever postwar coalition a state expects to belong to, as well as maximizing the incentives of the other members of this expected coalition to participate in it. But with uncertainty these objectives are inconsistent, since the incentive of states to participate in a coalition for the defense of the status quo is inversely related to its power relative to a potentially dominant state. One paradoxical implication of this fact is that while in a two-state world the fact that gains are cumulative implies that compromise agreements are not enforceable, in a world of three or more states the reverse is true: a state threatened by another state can increase the incentive of a third state to help defend it by conceding some of its resources to the threatening state and thereby weakening it-

What does all this tell us about the relation between the distribution of power and the likelihood of war? In a two-state world one could minimize the likelihood of war by maximizing the power of states that are satisfied with the status quo. However, it is not clear how to identify such states or to guarantee that they would always remain satisfied. Thus if compromise agreements are not enforceable, only equality of power will minimize the probability that either state will choose to use force against the other. In a world of three or more states, however, one must distinguish between the distribution of power among states and the distribution of power between some pair of coalitions that might fight each other. And if settlements are not enforceable, then even dissatisfied states must be concerned about how to protect what they already have. As a result, it is at least possible that threats to upset the status quo would always be met by an overwhelmingly powerful coalition, a possibility that would paradoxically require an equal distribution of power among states.

To see why, bear in mind that (other things being equal) the probability of one side's success in war varies directly with the ratio between its resources and those of its opponent and that the more unequal this ratio the less likely "other things" (i.e., assets that states have private information about) will matter. Thus states that wanted to deter an attack by all

possible antagonists would want to maximize the resources available to prevent every other state from upsetting the status quo. 19 Consider again, then, the distribution (100, 100, 100), and assume that no state wanted to diminish the power available to oppose some other state's expansion. Then, even if every state would prefer to have more resources, this distribution would have the same effect as the (150, 100, 50) distribution in the world without uncertainty earlier discussed; that is, no state would want to assist any other in expanding (since even if it expanded as well, the relative power of any coalition subsequently available to oppose the other expansionist state would be diminished), and any state that sought to expand on its own would be opposed by both the other two. Because distributions must be self-enforcing, in other words, even expansionist states would follow a collective security policy.

If this sort of symmetrical policy of deterrence is to succeed, however, any state contemplating expansion would have to be confident that all the resources that might potentially oppose it would in fact be used against it. Consider again the distribution (100, 100, 100) and suppose the first state believes that it has a strategy that will enable it quickly to defeat the second state at an acceptable cost (in spite of the equality of their military resources). If it is to be deterred from trying, it must believe that the third state will oppose it. But will it?²⁰ This depends not only on the third state's evaluation of the risks of not opposing it relative to the costs of doing so but also on what the third state believes about the second state's preferences; for it would be self-defeating for the third state to protect the second and then find itself facing a coalition between the second state and the first state—that is, in order for all states to follow a policy of collective security, it is necessary not only that they all prefer to follow a policy of maximizing deterrence but that it be common knowledge that they do. But precisely because military resources are distributed so equally, each state has reason to doubt that this is true of the others.²¹

Now that we have seen a connection between the idea of collective security and military deterrence, we can use the literature on deterrence theory to explore this problem further. The deterrence problem is to make one's threats credible when there is reason to doubt one's willingness to carry them out. This problem arises because the person or state making the threat has private information about his willingness to carry out the threat and has an incentive to misrepresent that information to the person or state being threatened. When modeled as a game with incomplete information, the standard conclusion is that to increase the credibility of its threat a state must take some action that it would be less likely to take if it were prepared to carry out its threat than if it were not (Wagner 1992). Doing this is much more difficult in the three-actor system I have described, however, than in the two-actor context in which the problem is normally discussed. For example, each state must try to show that it is prepared to join with another to defend the status quo but not to alter it by supporting another in an attack. It is not clear what actions would serve to discriminate between these two sets of preferences.²²

Moreover, if one state does attack another, this could be either because it does not share the preferences necessary to support a collective security policy or because it doubts that the others do. Should the others therefore seek to reestablish their credibility by jointly defending the status quo, or should they infer that the attacking state will not cooperate in a collective security system and therefore seek to make it less of a threat by reducing its power? And if they choose the latter alternative, how are they to protect themselves from each other after this is done?²³

Thus, while an equal distribution of power minimizes the role of private information in estimating the power of the community as a whole relative to the power of a single state that challenges the status quo, private information about the willingness of states to join in the defense of the status quo means that there may nonetheless be inconsistent expectations about whether a challenger would be successful. Consider, on the other hand, a distribution such as (140, 130, 30) and suppose that the two smaller states agree that any further increase in the power of the largest would be unacceptable and declare that they would cooperate to prevent it. If so, then the distribution itself would lend credibility to this claim, and this credibility could be reinforced by the formation of an alliance, the commitment of troops, and all the other actions that states customarily use to signal their intentions to each other. Thus this distribution lessens the role of private information in influencing states' expectations about who will defend whom against what. And the near equality of the two opposing coalitions reduces the incentive of either to use force against the other.

Thus, if wars affect the distribution of power, then (other things being equal) in a world of more than two states the distribution of power that minimizes the likelihood of war is one in which power is distributed sufficiently unequally among states that at least one state (or, if there are four or more states, a coalition of two states) is considered unacceptably close to dominance by the other states in the system, a distribution that will then lead to the formation of a stable opposing coalition which will nonetheless not be strong enough to have an incentive to use force to weaken the near-dominant state or states. The likelihood of war is minimized, in other words, when power is distributed sufficiently unequally among states that two stable but nearly equal opposing coalitions form.24

This conclusion can be used to illuminate post—World War II controversies among students of international relations about the relation between the distribution of power and the likelihood of war. Traditionally, when people have said that power was "balanced," they have meant that it was approximately equally distributed, so that any individual state that might contemplate expansion could be

opposed by another state of approximately equal power. In a world of more than two states, this also implied a multiplicity of possible coalitions of states hence the connection between "balanced power" and the shifting alliances of a "balance-of-power system." The conventional wisdom was that this distribution was the most stable one. This wisdom did not clearly distinguish, however, between stability in the sense of the preservation of the independence of the members of the system and stability in the sense of peace. This confusion was encouraged by the tendency to ignore the fact that while individual states could be opposed by other individual states with equal power, overwhelmingly powerful coalitions of states could form. This helped secure the stability of the system, since it meant that individual states had a long way to go before they were stronger than any possible countercoalition, and therefore hegemony could always be prevented. For precisely that reason, however, states could be uncertain about how far they might expand before they encountered effective opposition, and the fear that if they did not expand they might be defeated by superior coalitions gave them a strong incentive to do so. These facts help explain the two world wars of the twentieth century.25

After World War II, three competing ideas about how to secure the peace were influential in Great Britain and the United States: to restore the old system of "balanced power," to create a permanent alliance among the victors that would control the defeated countries, and to use international institutions to create a collective security system. There was instead a conflict among the members of the victorious coalition over how to secure their gains, which led to the Cold War, a development that can easily be understood in the context of the analysis offered. The leaders of the Soviet Union, fearing that their former allies would turn against them and join forces with the countries defeated in World War II, preferred a settlement that left Germany sufficiently weakerand the USSR sufficiently stronger—that their allies formed a counteralliance to deter the Soviets from any further expansion. ²⁶ The result was a distribution of power similar to the one described.

Because this conflict led to the division of Europe into East and West, it seemed to imply no possibility of a return to a system of shifting alliances among more or less equal states. For those who believed that such a system was the most stable one, this implied a pessimistic conclusion about the future. This interpretation was reinforced by the common view that it was such a polarization that had helped cause World War I. Instead of war, however, the polarization that accompanied the Cold War led to what John Gaddis has dubbed "the long peace" (Gaddis 1991). This fact supports an alternative view, based on the analysis offered here, that the polarization of the international system did not cause World War I but that its incomplete polarization helped make it possible and that it was the prolonged confrontation between East and West that helped keep the peace after World War II.²⁷

The distribution of power underlying this confron-

tation has mistakenly been identified with one in which the two largest countries can defend themselves without allies against any combination of adversaries (one of the common definitions of bipolarity).28 This has made it difficult to explain the fact that more than anything else, the Cold War between the United States and the Soviet Union has been a competition for allies" (Walt 1987, 3). However, this behavior can easily be understood in light of the argument presented here. It is precisely because it seemed so plausible that U.S. security did not depend on allies that so many resources were expended by the American government during the Cold War to demonstrate that it considered the defense of its allies to be a vital interest. This is consistent with the thesis that what is commonly known about the distribution of military capabilities is not enough to determine with certainty the vital interests of states, but a distribution of capabilities such as this one facilitates the exchange of private information about what those interests are. Thus the emphasis of the U.S. government on deterrence during the Cold War was not simply the result of the development of nuclear weapons—a fact that illustrates the close connection between my theme and deterrence.²⁹

Consider, on the other hand, the problem of deterring Iraq from its recent conquest of Kuwait. Even if it had been common knowledge that the U.S. government was committed to preventing any state in the Middle East from becoming unacceptably powerful, no one could have been certain that the United States would use force to liberate Kuwait if it were conquered by Iraq. And uncertainty about U.S. preferences gave the government of Saudi Arabia an incentive to avoid provoking the government of Iraq and thus to avoid stating clearly that Saudi Arabia would cooperate in opposing it. Moreover, because the United States had wanted the cooperation of Iraq in opposition to Iran, it had helped Iraq acquire sufficient military power that Saddam Hussein could believe that Saudi Arabia would not dare oppose it. But without the cooperation of Saudi Arabia, the liberation of Kuwait would have been impossible. Thus if, prior to the invasion of Kuwait, the United States had succeeded in convincing the government of Iraq that it had turned against it without convincing Saddam Hussein that the government of Saudi Arabia was prepared to oppose it as well, this would only have given Saddam Hussein an added incentive to absorb Kuwait. This, on a small scale, is an illustration of how shifting coalitions make deterrence more difficult.30

SUMMARY AND CONCLUSIONS

It is often said that war represents the failure of diplomacy. As Blainey pointed out, one could just as easily say that diplomacy represents the failure of war: the problem is to understand why states sometimes choose one and sometimes the other (1988, 292). And to understand the relation between the

distribution of power and the likelihood of war, we must understand how the distribution of power affects this choice. This is a much more complicated question than it is commonly made out to be, for two reasons. First, war and diplomacy are not just alternatives: the point of war is to influence the outcome of negotiations, so war can be a way of conducting diplomacy. Thus to understand the relation between war and diplomacy, one must understand the relation between the use of force and bargaining. Second, conclusions about the effect of the distribution of power on the probability of war that may seem plausible in a world of two states do not necessarily apply to historical international systems in which there have always been more than two states.

The primary function of force in bargaining is to improve one's bargaining position by increasing the costs of disagreement for one's adversary. Force can serve this function even if both sides can employ it against each other, as long as one expects to suffer proportionally less than the other (Pillar 1983, 144-95). However, force is much more effective if it can be used unilaterally, so that another function of force is to disarm one's enemy, thereby preventing him from using force against one while one uses force against him. All wars are to some extent contests in punishment, since all wars are to some degree costly and unpleasant. Interstate wars have primarily been contests in disarmament, however, in which each side seeks to acquire the ability to punish the other unilaterally by first destroying its military forces.

Counterforce contests, if fought to the finish, must end in the disarmament of one side or the other, or in stalemate. "Victory" and "defeat" in this context, then, refer to the outcome of a counterforce military contest and not to the achievement of the political objectives that may have motivated it, and "power" means whatever assets states have that affect the probability that they will win such a contest. The fruits of victory in this sense may be disappointing, and so power in this sense may be worth much or little. Wars, however, need not be fought to the finish, so that another possible outcome of war is that it may lead to a negotiated settlement before either side wins (or before it becomes certain who the eventual winner will be). Thus states may choose to fight even if the expected outcome of fighting is a military stalemate, if each is optimistic about the effect of a stalemate on the willingness of the other to compromise.

States must choose, then, between negotiating without fighting and fighting followed by negotiations. Any agreements that states reach must be self-enforcing, however, in the sense that implementing an agreement cannot be expected to enable one of the parties to overturn it and enforce a still more favorable agreement. Thus if the terms of an agreement affect the relative power of the parties to it (e.g., if what is in dispute is the distribution of territory and the military power of each is positively related to the amount of territory it controls), then compromise

agreements accepted in lieu of war may not be enforceable.

If agreements are enforceable, it is most likely that there will be an agreement that both antagonists prefer to war if their expectations concerning the likely outcome of war are consistent. This is the main reason for believing that the likelihood of war between two antagonists varies inversely with the degree of inequality in the distribution of power between them, because, for the reasons given, it seems plausible that inequality of power makes consistent expectations of the outcome of war more likely.³¹

However, much of the literature on international politics assumes not only that war is influenced by the distribution of power but also that war affects the distribution of power-and therefore that the outcome of one war will affect the expected outcome of subsequent wars. This implies that compromise agreements are not enforceable, so that if one state prefers the expected outcome of fighting to the status quo, war can be avoided only if the other prefers to surrender without fighting.³² Therefore in a twocountry world if both sides are equally likely to use force when faced with the same probability of winning, the likelihood of war is least if power is distributed equally (so that the likelihood that either will prefer war to the status quo is least) or if power is distributed very unequally (so that, for the weaker side, the probability of winning is outweighed by the expected costs of fighting).33

When there are more than two states, expectations of the outcome of wars depend on who will participate in them as well as on the distribution of power, and expectations about who will participate will be influenced by private information about how states define their interests. All states can be expected to have an incentive to defend their independence, however, so that the more a state's independence is threatened by another state or coalition of states, the more consistent should be everyone's estimates of the probability that it will join an opposing coalition. This leads to the conclusion that in a world of three or more states the likelihood of war is minimized when power is distributed sufficiently unequally that at least one state (or, if there are more than three states, a coalition of two states) is considered unacceptably close to dominance by the other states in the system, who therefore form a stable opposing coalition with nearly equal power.³⁴ This conclusion clarifies the relation between controversies about whether equal or unequal power distributions reduce the probability of war and controversies about whether bipolar or multipolar international systems are more stable.

The relation between the distribution of power and the likelihood of war depends, then, on whether the terms of possible compromise agreements that might be accepted in lieu of war influence the balance of power between the antagonists and therefore influence the probability that the agreement will be enforced—and if they do, it depends on how many states' interests will be affected by the outcome. Thus there can be no general answer to the question of

what relation one should expect between the distribution of power and the likelihood of war, and reasoning that may be appropriate for understanding conflicts among the great powers during certain historical periods may not be relevant to conflicts that have only local or regional significance or to other periods. Note that this conclusion would hold even if the only factor affecting the likelihood of war were the distribution of power, and power (i.e., all the publicly known attributes of states that affect the probability of their success in counterforce military contests) could be unambiguously measured.

In fact, of course, many other factors besides the distribution of power affect the likelihood of war, and their effect may be much greater. Moreover, the way in which decision makers translate the distribution of such commonly known assets of states as population and wealth into probability estimates of the outcomes of various possible wars may be difficult to discern and quite variable.³⁵ Thus it is not surprising that empirical tests of competing claims about the effect of the distribution of power on the probability of war have been inconclusive.

Finally, this discussion has two important implications for the use of formal models in investigating theoretical issues in the study of international politics: (1) the issues discussed here are more complicated than they are often made out to be and are therefore difficult to explore without the aid of formal models, but (2) in constructing such models one must be careful about the assumptions one makes. If the role of a formal model is to provide a counterexample to some general assertion in the literature, the realism of its assumptions is not very important.36 But if a model is to tell us something we did not already know about some historical situation, it is important that its conclusions not require that states in that situation either be able to do things they could not in fact do or unable to do things that they could in fact do. Many models assume that prior to war, any agreements states might make are enforceable but that once war begins no further negotiation is possible—and then proceed to analyze the implications of these propositions in a world of two states.37 As the current civil war in Yugoslavia graphically illustrates, these assumptions are not as innocuous as they appear.38 And even scholars who are likely to notice the significance of assuming that agreements between states are enforceable (e.g., those who identify themselves as "realists") tend to overlook the fact that the nonenforceability of agreements does not have the same significance in a world of more than two states that it has when there are only two.³⁹

Notes

An earlier version of this article was presented at the annual meeting of the American Political Science Association, 1992. I would like to thank James Fearon and Robert Powell for helpful conversations and correspondence on the subject.

- 1. For a recent discussion with citations to the literature, see Fearon 1992.
- It is sometimes suggested that this conclusion requires the assumption that all states are in fact interested in territorial expansion. However, this assumption is clearly stronger than necessary.
- 3. Both these arguments assume that it is impossible to decrease one state's likelihood of success in attacking without increasing the other's. Obviously this need not be true. In medieval times building a castle diminished the likelihood that one's enemies would be successful in attacking without increasing one's own chances of success in attacking one's enemies. Natural geographical barriers as well as great distances can have the same effect. This is one basis for the view that whether technology favors the defense over the offense is more important in influencing the likelihood of war than the balance of power. One cannot count on the appropriate technology, however, and given some prevailing technology, the relative size of military forces may still be important.
 - 4. A similar idea can be found in Timasheff 1965.
- 5. The latter method is the basis for the Rubinstein model of bargaining. For an accessible recent discussion of the relevant theoretical issues, see Kreps 1990. For an attempt to apply this model to the choice between fighting and bargaining, see Powell 1992.
- 6. One of the difficulties even with formal models of bargaining that assume incomplete information is that they predict that bargainers will reach agreement much sooner than they often do in fact (Powell 1992).
- 7. Consider Saddam Hussein's current reputation for compromise.
- 8. Because wars are contests between collectivities, there is a difference between postwar negotiations in which the defeated country retains a government and negotiates as a single political entity and a situation in which the victor occupies the defeated country and deals directly with the population. For discussions of bargaining between victor and vanquished, see Albert and Luck 1980; Keckemeti 1958; Sharp 1990. For a discussion of negotiated settlements of wars using cooperative bargaining theory, see Pillar 1983. For a discussion of negotiated settlements of civil wars, see Wagner 1993a.
- 9. One must distinguish between victory/defeat on one battlefield or in one theater and strategic victory/defeat. The Japanese defeated the U.S. forces at Pearl Harbor. Had the United States not retaliated and acquiesced in Japanese expansion in the Far East, this would have been because it chose not to, not because it was unable to, and in that case, it would have been considered a negotiated settlement between the United States and Japan influenced by a military engagement, not simply a military victory by Japan. One could say the same about a decision by the United States and England not to invade the European continent after the defeat of France by Hitler's Germany or a decision by the United States and its allies to acquiesce in the conquest of Kuwait by Iraq. This is relevant to understanding what Mearsheimer calls a "limited aims strategy" (1983, 23–66; see also Clausewitz 1976, 69, 90–99).
- 10. This is important to bear in mind in thinking about the impact of nuclear weapons on the likelihood of war. The combination of nuclear weapons technology and ballistic missiles changes the relation between the counterforce and punishment uses of organized military force and therefore the significance of the balance of power in the sense of that term employed here: because of ballistic missiles, it is difficult to disarm one's opponent completely, but adversaries are still able to do massive amounts of damage to each other (Schelling 1966, v-vii, 1-34). However, conventional wars have always been costly when neither side was able to disarm the other; and one cannot be certain that states with nuclear weapons will be dissuaded from engaging in the sort of contest in punishment that military stalemates have always made possible.
- Blainey actually seems to defend a stronger thesis—that inconsistent expectations of the outcome of war are a neces-

sary condition for fighting. Fearon (1992) analyzes a model illustrating the falseness of this claim, since even with consistent probability estimates of the outcome of war bargainers may not be able to reach an agreement they both prefer to fighting if their evaluations of the costs of fighting are not common knowledge. The same point is made more informally in Wagner 1993a. Because Fearon assumes consistent probability estimates, in his model the probability of war is completely unrelated of the balance of power.

Although Mearsheimer (1991) asserts that war is least likely when power is equal, his book, Conventional Deterrence, provides evidence that supports this version of the opposite view (idem 1983). In this book Mearsheimer presents several case studies supporting the thesis that war is most likely when decision makers believe they have a strategy that will enable them to win quickly without much cost—a blitzkrieg strategy (pp. 23–66). But he points out that "when a potential attacker enjoys an overwhelming force advantage, the importance of discovering and successfully implementing the optimum military strategy is not as great as when the forces are essentially balanced" (p. 65). This is consistent with the idea that when forces are equal, estimates of the likelihood of success are most likely to be influenced by factors whose status is private information.

12. For an example of this sort of problem, consider the worries of many Israelis about the effect of territorial compromises with the Palestinians on the ability of Israel to resist subsequent Palestinian demands. This may be what people have in mind when they say that because international conflict is a struggle for power, it is a zero-sum game. This is not a zero-sum game, however, since both adversaries would be better off if they could agree without fighting; the problem is that no agreement is an equilibrium.

13. For this to be true, any redistribution must reduce the beneficiary's probability of losing or its expected costs of war enough to compensate for the fact that the redistribution also reduces the beneficiary's net gains from winning. But it is unlikely to be common knowledge whether this is true or not, so that inconsistent beliefs about these effects may serve to inhibit compromise even if it is in principle possible. James Fearon has pointed out to me that if delays are expected between rounds of negotiation then with sufficient discounting of future benefits states might agree to settlements that led to piecemeal surrenders to territory. This provides a possible interpretation for what are called "salami tactics." I shall assume that states will not behave in this way.

14. One might object that this admittedly highly simplified depiction of the relation between the distribution of power before and after wars overlooks the fact that military resources are destroyed by war. However, as the examples of Japan and Germany illustrate, a war may destroy a country's current military capabilities without destroying its military potential—hence the significance of territorial expansion for the postwar balance of power.

15. Thus the victim has an incentive to make cheating easier by not resisting every member of the enemy coalition equally (Wagner 1986). For a historical example of this, see Kecskemeti's account of the debate among German leaders about what strategy to follow once they became certain of Germany's ultimate defeat in World War II (1958, 127–54). See also Koerner and Goemans 1990.

16. For a fuller discussion, see Wagner 1986. Niou and Ordeshook arrive at the same conclusion by assuming that the victim can protect itself from elimination by preemptively transferring enough resources to one of the members of the attacking coalition to give it 150 units and thus prevent any further transfers (Niou and Ordeshook 1990; Niou, Ordeshook, and Rose 1989). This is an extremely implausible assumption, however, not because voluntary transfers are impossible (they clearly are not) but because the assumption implicitly forbids any possible counteroffer to such a transfer. If counteroffers are possible, one must show why an ally could not prevent its partner from accepting such a transfer by threatening to ally with the victim instead. Clearly the victim would prefer such an offer to making the transfer, and the

ally who would be frozen out by such a transfer could be no worse off if he made it. Thus it appears that in any plausible noncooperative model of this situation in which counteroffers are not prohibited, all states desire more resources, and there is no uncertainty about the outcomes of wars, the preemptive transfers assumed by Niou and Ordeshook would not be equilibrium outcomes.

17. I shall continue to assume that military victory gives the winning side control over all the resources of the losing side and therefore that uncertainty only characterizes expectations of the outcome of combat. However, it is important to bear in mind that military victory only gives the victor the ability to use force unopposed and does not deprive the vanquished of all bargaining power. Thus victory does not necessarily mean that the winner can exploit all the resources of the loser or even that it will be strengthened by winning. Therefore there may be uncertainty about the effects of military victory as well as about whether to expect it. For a fuller and more rigorous analysis, see Wagner 1994.

18. Thus the unilateral transfers assumed by Niou and Ordeshook become more relevant when not all states desire to expand and there is uncertainty about the distribution of power.

19. Stephen Walt (1987) assumes that balance-of-power theory is inconsistent with the formation of defensive coalitions that are much more powerful than their adversaries and that such indexes as size, population, and gross national product are adequate measures of the power of states. Thus he concludes that the sizes of the alliances that formed against Germany and Japan and against the USSR are inconsistent with traditional balance-of-power theory. Neither assumption is warranted, however. See, e.g., the sections entitled "The Uncertainty of the Balance of Power" and "The Unreality of the Balance of Power" in Morgenthau 1967, 196–205.

20. Walt (1987) distinguishes between balancing and band-

20. Walt (1987) distinguishes between balancing and bandwagoning. If this distinction is as general as he claims, it ought to be applicable here, but in fact its implications are not clear. If the third state joins with the first, is that bandwagoning? We have seen that it is one way of trying to make itself more secure. Similarly, a concession by the second state to the first would increase the third state's incentive to defend it: Would it then be balancing or bandwagoning? These questions illustrate the fact that the distinction between balancing and bandwagoning is unclear unless one state is on the verge of dominance. This helps explain the motivation for Walt's ad hoc distinction between balancing against "power" and balancing against "threats."

21. Niou and Ordeshook (1990) discuss collective security

21. Niou and Ordeshook (1990) discuss collective security as a nonstationary equilibrium in a noncooperative model of balance-of-power system. However, their model assumes the possibility of preemptive unilateral resource transfers, no uncertainty about the outcomes of wars, perfect information (so that it is always known which state deviated from the equilibrium), and a preference for expansion on the part of all states. Without these assumptions it is doubtful that the punishment strategies necessary to sustain a nonstationary equilibrium of this sort could be supported.

equilibrium of this sort could be supported.

22. Consider, for example, how England might have shown, prior to World War I, that it would ally with Russia to prevent the expansion of Germany in case of a general war on the continent but would not support Russia if it tried to make gains at the expense of Germany and Austria.

gains at the expense of Germany and Austria.

23. Consider the question in the context of U.S.-Soviet cooperation in the war against Hitler's Germany and the U.S.-Soviet conflict over the future of Germany that followed.

24. For a fuller discussion, see Wagner 1994.

25. Kenneth Waltz was perhaps the first to point out this problem with international systems in which power was distributed more or less equally. However, he mistakenly identified it with the problem of securing contributions toward the supply of a collective good (Waltz 1979, 164–65). The real difficulty is instead the fact that until a state is close to dominance, opposing its expansion may not be a collective good. Therefore the problem diminishes not when multiactor international systems are replaced by two-actor systems

(which has never happened) but when states are powerful enough to attract organized opposition before they attempt to expand (Wagner 1993b; see also Koerner and Goemans 1990).

26. This interpretation of the Cold War implies that ideology was important not because it influenced the objectives of Soviet leaders but because it affected their expectations of the future behavior of their allies and because of the effect of the Stalinist system on the confidence of Soviet leaders in their

ability to control large amounts of territory.

27. With respect to World War I, compare the coalition that won the war with the alliances that preceded it. Moreover, while Britain's commitments (which reflected its interests) turned a continental war into a world war, uncertainty about what Britain would do helped make the war more likely (Levy 1990/91). Of course, during the Cold War not every state joined in opposition first to the Sino–Soviet alliance and then to the Soviet Union alone, and there was a great deal of debate about how large an opposing coalition was necessary. This is not surprising, given the uncertainty involved in estimating the distribution of power.

28. Many writers assume that since the United States and the USSR did not need allies there were only two "great powers", and therefore that the international system during the Cold War was equivalent to one with only two states. This has led to further confusion by mingling together controversy about the significance of the number of actors with controversy about the effect of the distribution of power among them. For a fuller discussion of the various meanings of the word bipolarity and their relation to the analysis offered here,

see Wagner 1993b.

29. In explaining the behavior of the American government during the Cold War, it is important to bear in mind that having to defend Europe from even very small military encroachments was considered almost as big a disaster as trying to defend it and failing. Thus the objective of policy was not simply to be able to defend one's interests with some acceptable probability of success, but to minimize the probability of having to do so. This was a much more ambitious objective than states had pursued prior to World War II.

30. I do not mean to suggest that the U.S. government made no mistakes in dealing with Iraq but only that criticisms of its behavior after the fact have understated the difficulty of the problem, in part because they assume that the United States alone, by acting differently, could have deterred the invasion of Kuwait. For a fuller discussion, see Stein 1992.

invasion of Kuwait. For a fuller discussion, see Stein 1992.

31. Bear in mind that "power" in this context means all the resources of states that influence the probability of their success in a counterforce military contest and that are matters of common knowledge.

32. See, however, the qualifications in n. 13.

33. However, since one side can become nearly certain of its eventual defeat before a war is fought to the finish, wars can still be ended by negotiation even though they could not be prevented by them. Moreover, when power is distributed equally, the role of private information in influencing expectations of the outcome of war is increased, so that if war occurs the two sides are likely in fact to have inconsistent expectations of its outcome. Blainey (1988) confused uncertainty with inconsistent expectations and thus falsely inferred that because wars can lead to negotiations and because prior to war both sides tend to be optimistic about its income, wars are always caused by inconsistent expectations and thus that inequality of power always reduces the likelihood of war.

34. In evaluating the significance of this conclusion, one must bear in mind the fact that it does not tell us how likely war is when its likelihood is minimized. Moreover, I have throughout assumed that the distribution of power could be changed only by wars and alliances. As a result first of the democratization and then of the industrialization of war, however, since the French Revolution the distribution of power has been subject to very large exogenous changes. When no state or pair of states is close to dominance, such changes magnify the difficulty states experience in developing consistent expectations of each other's behavior. When one or two states are close to dominance, however, an expectation of

an exogenous change that would strengthen them can provide a motivation for the other states to wage a preventive war, since even a 50% chance of defeating the near-dominant state or states before they become stronger may be preferable to a much smaller chance of defeating them later.

35. In particular, there is no reason to believe that if the power estimates of the Correlates of War Project are converted into percentages they can be used to represent the probability estimates of historical decision makers.

36. See, e.g., Fearon's (1992) use of a formal model to provide a counterexample to a claim in Blainey 1988.

37. See, e.g., the model analyzed in Bueno de Mesquita and Lalman 1992. There are other, stronger, assumptions also embedded in the Bueno de Mesquita and Lalman model, among which is the assumption that the state making a demand has a first-strike advantage if it chooses to fight but surrenders that advantage to the victim if it chooses to

negotiate.

38. The argument presented here is relevant to one of the issues in the current debate about how outsiders might help end the war in Yugoslavia-whether offering to enforce a settlement or increasing the power of the Bosnian forces would make a settlement more likely. Suppose outside intervention is expected to prevent the Serbs from defeating the Bosnians and therefore lead to a military stalemate. If both sides were confident that any settlement they reached would be enforced, then outside involvement leading to a stalemate might lengthen the war if each side were optimistic about the other's willingness to compromise on the terms of such a settlement in order to avoid continuation of the conflict. On the other hand, if (as seems more likely) neither side is confident of outside enforcement and any territorial settlement will influence the balance of power between the combatants in subsequent conflicts, then expectation of a stalemate might lead the Serbs to accept an armistice that preserves the existing distribution of territory. However, any subsequent change in the distribution of power between the two sides might lead to a reopening of the conflict. In the meantime, the war continues because the Serbs are too confident of winning and the Bosnians not sufficiently certain of losing to stop fighting. Thus, if the war cannot be ended by diminishing the expectations of the Serbs, it can only be ended by diminishing the expectations of the Bosnians.

39. On this point, see also Snidal 1991.

STRATEGIC VOTING EQUILIBRIA UNDER THE SINGLE NONTRANSFERABLE VOTE

GARY W. COX University of California, San Diego

Previous investigations of strategic voting equilibria in mass electorates have looked only at single-member districts. I shall investigate such equilibria in multimember districts operating under the single nontransferable vote system. What appear to be the most natural equilibria conform to the M+1 rule, according to which strategic voting in M-seat districts produces exactly M+1 vote-getting candidates in equilibrium, any others having their support totally undercut. This result provides the beginnings of a formal underpinning for Reed's recent extension of Duverger's Law to the Japanese case. The model also generates specific and empirically testable hypotheses concerning the exceptions to the M+1 rule that one ought to expect in equilibrium. I test these hypotheses with Japanese data. Finally, the model also reveals a type of strategic voting that is specific to multimember districts. I use Japanese data again to explore the empirical importance of this kind of strategic voting.

or as long as voting procedures have been used to decide important and controversial issues, there have been legislators and electors willing to vote strategically. Theoretical interest in strategic voting dates at least to Pliny the Younger (see Farquharson 1969) and probably earlier. I shall build on rather more recent and formal treatments of the strategy of voting: those framed in the decisiontheoretic and game-theoretic traditions. Most of this work has appeared in the last 25 years and focuses on the behavior of legislators (e.g., Austen-Smith 1987; Banks 1985; Farquharson 1969; McKelvey and Niemi 1978; Miller 1980; Ordeshook and Schwartz 1987; Shepsle and Weingast 1984). I shall focus on the other, less well trodden area of research into strategic voting, that dealing with the behavior of voters in mass elections.

I deal in particular with elections satisfying the following three criteria: (1) each voter casts a single vote (for a candidate, not a party), (2) there are $M \ge$ 1 seats to be filled in the district in which the election is held (the model focuses on one district at a time), and (3) plurality rule determines who wins the available seats (so the candidates with the M highest vote totals win election). Two electoral systems satisfy these criteria: the Anglo-American first-past-the-post system, in which M = 1, and the Japanese single nontransferable vote (SNTV) system, in which M > 1. The first of these systems is, of course, widely used; the second is currently employed at the national level only in Japan and Tajwan (and the Japanese are, as of this writing, in the midst of changing their electoral system). Although structurally very similar, the difference in district magnitudes between the two systems leads to substantial practical differences in systemic performance and party strategy. Nonetheless, the two systems are alike in their strategic voting equilibria, as will be shown.2

Although my primary interest here is in the theoretical nature of strategic voting under SNTV (I shall consider the Anglo-American system to be SNTV

with M = 1), some important and empirically testable implications of the theory arise along the way. These will be duly explored.

First, I shall review the previous formal literature on strategic voting (leaving the vast informal literature largely untouched). Then, I shall describe an M-seat K-candidate model of strategic voting under SNTV. Next, I shall show that in equilibrium, no votes are wasted at any margin, which entails both that identifiably weak candidates are deserted by their supporters (the feature upon which previous work has focused) and that identifiably strong candidates are deprived of their excess supporters. Finally, I shall explore the empirical usefulness of the model, using Japanese data as an illustration, and conclude.

PREVIOUS RESEARCH

The most widely recognized form of strategic voting occurs in single-vote plurality-rule elections held in single-member districts. As early as 1869, Henry Droop (an English advocate of proportional representation) recognized the basic logic: "As success depends upon obtaining a majority of the aggregate votes of all the electors, an election is usually reduced to a contest between the two most popular candidates. . . . Even if other candidates go to the poll, the electors usually find out that their votes will be thrown away, unless given in favour of one or the other parties between whom the election really lies" (quoted in Riker 1982, 756). Droop also saw an important systemic consequence of this district-bydistrict tendency toward strategic voting: the political nation was divided into two large catchall parties, rather than into many smaller and better-defined parties (see Riker 1982, 756-57). He thus anticipated what we now know as Duverger's Law-the proposition that electoral laws mandating the use of plurality rule in single-member districts tend to produce two-party systems (Duverger 1955; Riker 1982).

Formal mathematical study of strategic voting in the last 20 years has had two stages: an early decision-theoretic stage and a more recent game-theoretic stage. The decision-theoretic perspective on strategic voting (see McKelvey and Ordeshook 1972) is essentially the same as Droop's: some voter, whose favorite candidate has a poor chance of winning, notices a personal preference between the top two candidates; the voter then rationally decides to vote for the most preferred of these top two competitors, rather than for his or her overall favorite, because the latter vote has a much smaller chance of actually affecting the outcome than the former. The decision-theoretic approach adds to common sense not just greater precision about the assumptions implicit in Droop's reasoning (e.g., the probability not of victory but of ties and near ties matters directly) but also greater generality: the basic model has been extended to illuminate strategic behavior in multimember districts (Cox 1984), approval voting elections (Niemi 1984), and a variety of other electoral systems (Hoffman 1982)

Nonetheless, decision-theoretic analyses, both formal and informal, still deal essentially with a single voter in analytic isolation. The logical next step is to consider whether strategic voting by some voters makes such voting by others more or less likely. In particular, suppose a close third-place candidate in a single-member district begins to lose the support of his least committed followers (those who prefer him only slightly to one of the two frontrunners). This erosion of support will, if known (perhaps through polls), lead voters to reduce their estimates of the candidate's chances. But as the candidate's chances are seen to fall, some of his slightly more committed followers may abandon ship for one of the frontrunners. The process might, in theory, continue until the candidate was left with no support.

This line of thinking is game-theoretic. It essentially asks how much strategic voting there is in equilibrium. Should one expect that third-place candidates will always lose all of their support because of strategic decisions among their followers? Or are there general conditions under which this erosion of support is fairly limited or even negligible?

I addressed these questions earlier in the context of a model (similar to that in Ledyard 1984) in which three candidates compete for a single seat under the usual Anglo-American rules (Cox 1987). The key assumptions of the analysis were that all voters are instrumentally rational (i.e., they care whom they vote for only insofar as it affects the outcome of the election), that voters have incomplete information about each other's preferences over outcomes, and that all voters have "rational" expectations. I showed that in almost all equilibria some voters vote strategically and that the marginal impact of strategic voting was to decrease the effective number of parties (Laakso and Taagepera 1979).

Palfrey (1989), exploring essentially the same model, was able to characterize its equilibria in terms of candidate vote shares, showing that they fall into

two classes: Duvergerian equilibria (in which the level of strategic voting is such that the support of all but two of the candidates is undercut completely) and non-Duvergerian equilibria (in which two or more candidates are so nearly tied for second that the voters cannot decide which one to discount, leaving more than two significant candidates in the field). Palfrey believed that the non-Duvergerian equilibria were razor's-edge phenomena and hence that he had provided an internally consistent explanation of Duverger's Law in terms of strategic voting alone. Myerson and Weber however, have shown that this belief is incorrect (1993, 106). Although the non-Duvergerian equilibria do seem unusual because of their requirement that two or more candidates be virtually tied for second, they are not unusual in the mathematical sense of being nongeneric. The intuition behind them is roughly as follows. Suppose two leftist candidates (e.g., Charles Goodell and Richard Ottinger) and one rightest (e.g., James Buckley) are competing for a single post (one of the U.S. Senate seats for New York in 1970). The rightist is ahead, the two leftists trailing but close to one another. Under these conditions, leftist voters will have a hard time coordinating on one of the leftist candidates, and a non-Duvergerian result can (and did) ensue. This failure to coordinate, moreover, does not require nongeneric conditions on the distribution of voter types, such as that the two leftists have exactly the same number of voters ranking them first. If more voters rank leftist A first than rank leftist B first, for example, then the two can still end in a dead heat (or sufficiently close) if it is expected that B has a larger chance of being tied for first with the rightist than does A. Such beliefs appear unusual in that they require the "objectively weaker" candidate B to have a better chance of being tied for first than the "objectively stronger" candidate A, but they are not ruled out by the Bayesian equilibrium concept. At present, therefore, Duverger's Law cannot be derived exclusively from analyses of strategic voting equilibria.3

Myerson and Weber advance a model of voting equilibria applicable in a wide range of single-winner electoral systems—not just ordinary plurality rule but also approval voting, Borda's method of points, and many other systems as well. The main difference between their approach and Palfrey's is that they assume as an axiom something Palfrey derives endogenously, roughly, that candidates generally expected to place third or lower in the poll are much less likely to be tied for first than candidates generally expected to place first or second in the poll.

I shall try to extend the study of strategic voting to cover multimember districts. I adapt Palfrey's model to the multimember context, holding all other institutional features (one nontransferable vote per voter, seats allocated by plurality rule) constant. At the same time, some features of the Myerson and Weber (1993) and Hoffman (1982) approach are incorporated as well

A K-CANDIDATE M-SEAT MODEL

There are K candidates, indexed by $K = \{1, \ldots, K\}$, competing for M seats. The M candidates placing highest in the poll win the available seats. If two or more candidates are tied for Mth in the poll, then the tie is broken equiprobably. After any ties have been broken, the *outcome* of the election is a set of M elected candidates. The set of all possible outcomes, denoted Ω , accordingly has $\binom{K}{M}$ members. Candidates are nonplayers in the model; they take no actions and are simply "entities with fixed characteristics about which voters might care."

There are n voters, each possessing a (strict) preference ranking over the possible outcomes of the election. The analysis is simplified, without altering the basic point, if we assume that voters' preferences over outcomes are additively related to their preferences over candidates, that is, each voter *i* is able to assign Von Neumann-Morgenstern utilities to each candidate— u_{i1} , u_{i2} , . . . , u_{iK} —such that outcome $\alpha \in$ Ω is preferred to outcome $\beta \in \Omega$ if and only if $\Sigma_{i \in \alpha} u_{ij}$ $> \sum_{i \in B} u_{ii}$, with indifference obtaining if and only if the summed utilities are equal. Voter utilities can be rescaled in the standard fashion so that the most preferred candidate yields a utility of 1, the least preferred candidate, a utility of 0. After this rescaling, voter i's preferences (or voter i's type) can be described by the vector $u_i = (u_{i1}, \ldots, u_{iK})$, an element in the set $U = \{(u_1, \ldots, u_K): \max\{u_j\} = 1 \& \min\{u_j\} = 1 \}$ $0 \& u_i = u_k \text{ only if } j = k$.

The relative frequencies of the different possible types of voter preference are given by a cumulative distribution function F defined over U. I assume that all possible preferences are represented in the electorate, possibly with vanishingly small probability (formally, the support set of F is U). I also assume that the probability two randomly sampled voters have identical preferences is negligible (formally, F has no mass points).⁴

Each voter chooses a vote in order to maximize expected utility, something that depends not just on the voter's preferences over candidates but also on his or her *expectations* about how well each candidate is likely to do. These expectations are formalized here as a vector $\pi_i = (\pi_{i1}, \ldots, \pi_{iK})$, where π_{ij} equals i's (subjective) probability that a randomly selected voter will vote for candidate $j \in K$. Equivalently, π_{ij} is the expected proportion of the electorate who will vote for j, according to i. Given preferences (u_i) , expectations (π_i) , and knowledge of the number of voters (n), voter i faces a standard decision problem, whose details are given in Appendix A. The solution to i's problem (i.e., the set of votes that maximize expected utility, given u_i , π_i , and n) is denoted $V(u_i; \pi_i, n) \subseteq K$.

The model is completed with two further assumptions whose joint effect is to restrict the nature and consistency of voter expectations. First, I assume that the distribution of voter preferences, F, is common knowledge. Second, I assume that voters' expectations are publically generated (e.g., by polls and newspaper analysis of the candidates' chances), so

that diversity of expectation among the electorate is minimized. In the discussion that follows, I take this notion to the logical extreme and assume that every voter has the same expectations: $\pi_i = \pi$ for all i. This assumption can be replaced with a less stringent one, however, namely, that the expected *order* of finish of the candidates is the same for all voters, in the sense that they all agree on which candidates are *trailing* (expected vote shares that put them strictly below (M + 1)th place), which are *leading* (expected vote shares that put them strictly above Mth place), and which are *marginal* (neither trailing nor leading).

Given these two postulates, the maintained assumption of voter rationality implies a certain consistency between F and π in equilibrium, for, not all expectations π are "rational" in light of the voter's knowledge of the distribution F of voter preferences. Suppose (to take a four-candidate example) that some voter thought π equaled (.25, .25, .25), so that a randomly selected voter was equally likely to vote for any of the candidates. This expectation is clearly not consistent with a distribution of voter preferences in which the proportion of voters ranking candidate 1 last exceeds .75, since voting for 1 is a dominated strategy for such voters.

More generally, if π is a publically generated expectation common to all voters, and the number of voters is common knowledge, then each voter can simply compute the optimal votes $V(u; \pi, n)$ of all other voter types u. Then, knowing the distribution of voter types, the voter can calculate the proportion of the electorate who, given π and n, will vote for each candidate.

To see this, let $H_j(\pi, n) = \{u \in U: j \in V(u; \pi, n)\}$ be the set of all voter types who will vote for j, given π and n. Then the probability that a randomly sampled voter will vote for j is simply $\int_{H_j(\pi, n)} dF$. If $\int_{H_j(\pi, n)} dF$ is not equal to π_j , then the original expectations are not tenable: to continue to believe them entails believing that some other voters will not vote rationally.

This is the gist of the argument for imposing the following "rational expectations" condition on voter beliefs.

RATIONAL EXPECTATIONS CONDITION. The expectations π are rational with respect to the distribution F if, for all j, $\pi_j = \int_{H_i(\pi, n)} dF$.

The equilibrium conditions for the model are then two. First, every voter votes so as to maximize expected utility, given expectations π (and n); that is, voters of type u vote for a candidate in $V(u; \pi, n)$. Second, the expectations π satisfy the rational expectations condition. These equilibrium conditions are identical to those imposed in a symmetric Bayesian Nash equilibrium, the only differences being the interpretation of the model's elements.

VOTING EQUILIBRIA & WASTED VOTES

What are the equilibria of the model just specified? Letting $N(\pi) = |\{j \in K: \pi_j > 0\}|$ be the number of

candidates with positive expected vote shares, there are three main cases to consider: $N(\pi) < M$, $N(\pi) = M$, and $N(\pi) > M$.

Equilibria with $N(\pi) < M$. Equilibria with fewer votegetting candidates than there are seats to be had do not exist. Suppose, to the contrary, that $N(\pi) < M$ for some expectations π satisfying the rational expectations condition. In this case, perversely enough, no voter would actually vote for any candidate j such that $\pi_i > 0$ (i.e., $\pi_i > 0 \rightarrow j \in V(u; \pi, n)$ for no u). This follows because, given π , n, and the usual Nash assumption, each voter believes that all candidates j with $\pi_i > 0$ are certain to be elected. Thus there is no incentive to vote for them. On the other hand, voting for the most preferred of the candidates *j* with $\pi_i = 0$ is, under the same assumptions, certain to elect that candidate (by breaking a tie among $K-N(\pi)$ candidates, all with zero votes, in favor of the selected candidate).

Equilibria with $N(\pi) = M$. Such equilibria do not exist either. Consider a four-candidate, two-seat example to illustrate the point. If $\pi = (0, 0, .5, .5)$ is an equilibrium, then it must be that a voter preferring candidate 1 to 2, 2 to 3, and 3 to 4 would vote for 4 or for 3, given π . But voting for 4 is a dominated strategy for this voter. And given π , voting for 3 is not optimal, for it is possible that 3 will receive less than two votes. In these cases, a vote for 1 is superior to a vote for 3, since it either breaks a three-way tie for second in 1's favor (if 3 receives no votes) or puts 1 into a two-way tie with 3 for second (if 3 receives one vote), both desirable results. In all other cases (i.e., 3 has more than one vote) voting for 1 and voting for 3 yield identical outcomes. Thus, no voter of the specified type will vote for either 3 or 4, and given the assumption that there are some voters of each type, the assumption that π satisfies the rational expectations condition is contradicted.

Equilibria with $N(\pi) > M$. This is the most interesting case, and the one that takes the most work to nail down. Relabel the candidates, if necessary, so that $\pi_j \geq \pi_{j+1}$ for all $j \in K\{K\}$. Note that with this relabeling, the condition $N(\pi) > M$ implies that $\pi_{M+1} > 0$. Given a distribution F of voter types, I shall say that the expectations π are a limit of rational expectations if and only if, for every $\varepsilon > 0$, there exists an integer N and a sequence $\{\pi^n\}$ of rational expectations such that n > N implies $|\pi^n_i - \pi_i| \leq \varepsilon$; that is, π is a limit of rational expectations if and only if arbitrarily large electorates can have rational expectations that are arbitrarily close to π . The main result is presented in the following theorem and its corollary.

THEOREM 1. Suppose that either (1) $0 < \pi_j < \pi_{M+1}$ for some j > M+1 or (2) $\pi_M < \pi_1$. Then π is not a limit of rational expectations.

For the proof, see Appendix B. The basic logic of the proof is this: if $0 < \pi_j < \pi_{M+1}$, then candidate j is virtually sure to lose for sufficiently large n, and

voting for the most palatable of the candidates most likely to be tied for Mth yields a higher expected utility than voting for j; if $\pi_M < \pi_1$, then candidate 1 is almost certain to win for sufficiently large n, and, again, the instrumental voter's attention turns to those candidates with "asymptotically large" conditional tie-probabilities.

A direct corollary of Theorem 1 is the following.

COROLLARY 1. If π is a limit of rational expectations, then (1) $\pi_1 = \pi_2 = \ldots = \pi_M$ and (2) $\pi_j \in \{0, \pi_{M+1}\}$ for all j > M+1.

For M=1, this corollary simply extends Palfrey's earlier three-candidate result to cover an arbitrary number K of candidates. For M>1, the corollary carries two messages about wasted votes, rather than just one. Like Palfrey's previous work, it shows that strategic voting works against trailing candidates (those who fall "too far" behind in the polls). In addition, the corollary shows that strategic voting relieves leading candidates (those who are "too far" ahead in the polls) of their excess votes, reducing them to equality with all other likely winners. Thus votes are wasted neither on weak nor on strong candidates.

The nature of the two processes (winnowing out the weak, equalizing the strong) is slightly different. Voters who find themselves supporting a trailing candidate are more likely to desert that candidate as other voters desert him. There is thus a certain momentum to strategic voting as it affects weak candidates. Voters who find themselves supporting a leading candidate, in contrast, are less likely to abandon that candidate upon hearing of other defections. To illustrate this, consider a contest between three candidates (A, B, and C) in a two-seat district. Suppose A is ranked first by 40% of the electorate and is expected to get all of their votes, while B and C are each expected to get 30% of the vote. In this case, A voters who prefer C to B are tempted to switch their support to C, while A voters who prefer B to C are tempted to switch their support to B. If those who prefer C (B) succeed in bringing A and C (B) into a dead heat at 35% (by abandoning A), then similar action by those who prefer B (C) will be forestalled. If both sides (the A supporters who prefer B to C and those with opposite preferences) abandon A, then the worst outcome for both results. Thus, there is a Chicken aspect to the game: as soon as the existence of excess votes becomes common knowledge, both sides begin "driving" toward abandonment. The question is, Which side will swerve first? The present model, it should be noted, does not capture this Chicken aspect at all well formally, since the equilibrium concept simply assumes away all coordination difficulties. This may be one important reason that the model's predictions regarding the elimination of votes wasted on strong candidates fare so poorly in the empirical analysis.

As in the single-seat case, the corollary divides multiseat equilibria into two classes: (1) Duvergerian equilibria, with M + 1 vote-getting candidates, and

(2) non-Duvergerian equilibria, with more than M+1 vote-getting candidates. The Duvergerian equilibria entail a close M-way race for the M available seats, with a single runner-up, all other candidates being reduced to near-zero support. The non-Duvergerian equilibria look the same, except that there are two or more runners-up, whose nearly identical expected vote totals prevent any being winnowed out from the field of viable candidates.

STRATEGIC VOTING AS AN EXPLANATION OF REAL-WORLD DATA

I shall consider the empirical usefulness of the results just sketched. There is no question that instrumentally rational agents of the type stipulated, with rational expectations, will behave in a very precise fashion. But of course it is possible to doubt that real people are entirely instrumentally motivated or that they have rational expectations. And it is a matter of simple observation that the top M candidates in SNTV elections do not have virtually identical vote shares. Taken as is, then, the model's predictions meet with immediate empirical disconfirmation. A reasonable conclusion is that one or more of the model's assumptions are poorly approximated in the real world.

Overly precise predictions are typical of highly abstract models and a typical (often unstated) assumption of theoreticians is that the model's predictions could fairly easily be made more reasonable, without changing their qualitative nature, by adding a bit of "noise" or "friction" to the model. Since the empirical testing of rational choice models has been strongly criticized of late (Green and Shapiro 1993), I will explore what some of the noise to be added might be. Even if adding noise (e.g., noninstrumental voters or voters whose expectations are inconsistent) can in principle produce predictions not obviously false, there is still interest in two questions: (1) Do real-world data conform sufficiently closely to the model's predicted equilibria that one might believe that a model essentially similar to this one (just adding noise) might tally with real-world patterns? (2) Even if the real world conforms to sylized versions of the model's equilibria, are there other explanations that predict the same patterns? I shall examine each of these topics-noise, empirical patterns, and alternative explanations—in turn.

Noise

There are many frictions that would, if introduced into the model, soften its predictions. Here, I shall discuss only two: the introduction of noninstrumental and of "ignorant" voters. Introducing voters who are not purely instrumental but also derive utility from the particular action that they take (abstaining, voting for some candidate) can have various implica-

tions. If one assumes that voters bear some cost from voting but that conditional on voting, they do not care whom they vote for except insofar as it affects the outcome, then not much changes. One would have to assume that a fixed proportion of the electorate had nonpositive costs of voting (or something to this effect) in order to generate growing turnout, but after that, the model's results would go through unchanged.

On the other hand, if one assumes that voters care about whom they vote for as well as who wins, then much may change. For such mixed-motivation voters, action-contingent utilities would dwarf outcome-contingent utilities as the electorate grows because outcome-contingent utilities are discounted by the probability of a single vote affecting the outcome, whereas action-contingent utilities are not. Thus, a mixedmotivation voter who votes at all votes for the candidates that he or she likes to vote for, regardless of whether this is the candidate that "strategic voting" would dictate supporting. If the entire electorate had mixed motivations, then expectations about how well the candidates were doing would be of negligible importance to voter decisions, and any pattern of expectations could be consistent with voter rationality in equilibrium.

If only some voters have mixed motivations, then the result is more interesting. Let *Q* be the proportion of the electorate that is purely instrumental or outcome-oriented and let 1 - Q be the proportion with mixed motivations. In the limit, the latter group will be purely noninstrumental or action-oriented, as noted. Let F be the distribution of preferences in the instrumentally motivated electorate and let P_i be the proportion of the noninstrumentally motivated electorate that prefers voting for candidate j. Then the rational expectations condition becomes $\pi_j = Q \int_{H_j(\pi_j, n)} dF + (1 - Q)P_j$ for all j. If candidate j is trailing, then j loses all instrumental support but retains support among the mixed electorate. Thus, if Q is close to 1, the result does not change much: in equilibrium, strategic voting will reduce weak candidates-if not to zero support, then down to some fairly small minimum (i.e., $(1 - Q)P_i$) of noninstrumental support and will reduce strong candidates down to equality with all other likely winners.

Introducing "ignorant" voters relaxes a different premise of the model, namely, that the identity of trailing, marginal, and leading candidates is common knowledge. The publicness of this knowledge keeps all instrumental voters on the same page of the playbook: they *all* desert the (publicly identified) trailing and leading candidates in order to focus on the (publicly identified) marginal candidates.

One might argue for the reasonableness of the common-knowledge assumption as regards trailing candidates by noting the self-fulfilling character of voter expectations. If every voter believes that candidate j is out of the running, then j will in fact be out of the running. Moreover, if some voters, who previously intended to vote for j, come to believe that j is

behind, they will desert j, thereby making it more likely that j is behind.

The arguments just given do not really justify assuming that the identity of trailing candidates is common knowledge, however. They only justify a belief that in equilibrium, the identity of trailing candidates will probably be common knowledge. To simply assume the common-knowledge condition is similar to assuming that the players in a two-person Battle of the Sexes will coordinate on one of the two pure-strategy Nash equilibria. As regards leading candidates, voter expectations are not even self-fulfilling. If each voter believes that candidate *j* is leading (hence virtually sure to win), then each will abandon *j*, who will in fact finish out of the running.

If who trails and who leads is not common knowledge, then an extra degree of freedom is opened up in the model. In the extreme, the analyst can stipulate (possibly inconsistent) expectations for each voter. This degree of analytical latitude would be enough to make any pattern of aggregate vote returns consistent with some equilibrium of the model. On the other hand, placing limits on the extent to which voters' expectations differed would begin to restore some "bite" to the model's predictions.

These observations motivate asking how voters learn about the candidates' expected vote shares. In the real world, the forces generating common knowledge of candidate chances are polls, news analyses, candidate statements, and other bits of essentially free information. It has to be free information because rationally ignorant voters will not exert any effort to determine who is ahead for the same reason that they will not research candidate positions carefully (Downs 1957). Thus, the extent to which the real world approximates the model's strictures should depend on the availability and clarity of free information regarding the relative standing of the candidates. If voters are exposed to lots of free information (e.g., frequently published polls) that reveals some candidates to be clearly trailing the others and if this information seeps out to a large proportion of the instrumental electorate, then one expects that trailing candidates will be left with not much more than their noninstrumental support. If voters have no information regarding candidate chances (and diffuse priors), then sincere voting is consistent with expected utility maximization, and one does not expect objectively trailing candidates (those who have fewer voters ranking them first) to lose their instrumental support. If (to take a third example) voters have conflicting information regarding candidate chances, then strategic voting by some voters may "cancel out" strategic voting by others, leaving little or no observable impact on the aggregate distribution of votes.

From this perspective, the tendency of candidates trailing in multicandidate races to dispute the accuracy of the polls that show them trailing, to claim to have different results in proprietary polling, and to urge voters to ignore the polls is understandable. All these actions make good sense from the point of view

of preventing their last-place status from becoming common knowledge.8

Empirical Patterns

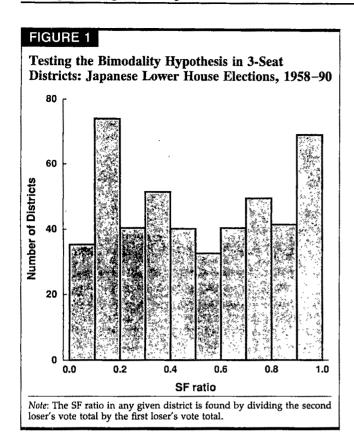

The model predicts that strategic voting will produce two main patterns: (1) trailing candidates will be deserted by all their supporters, and (2) leading candidates will be deserted by their excess supporters. In examining how these two predictions fare, I shall look at postwar Japanese electoral data from the period 1958–90. Evidence is fairly good that Japanese voters do strategically desert weak candidates. Steven Reed (1991), in an extensive examination of the postwar Japanese experience with SNTV, finds a clear and increasing tendency for there to be only M+1 viable candidates in each district. This pattern, of course, fits the Duvergerian equilibria identified by the model.

What of the non-Duvergerian equilibria? These equilibria all entail that the first and second losers receive nearly the same number of votes. Thus a theoretically interesting statistic is the *second*-to-*first* loser's vote total ratio (SF ratio). Under Duvergerian equilibria, the SF ratio will be near 0. Under non-Duvergerian equilibria, the SF ratio will be near 1. Thus, if one were to compute the ratio for a number of districts and plot the resulting distribution, one should find a spike at 0 and a spike at 1.

Allowing for some frictions in the model (e.g., some noninstrumental voters, some disagreement about which candidates are trailing or leading, and which are marginal), the prediction is softened. The SF ratio should either be close to 1 (when second losers are so close in the polls to first losers that they do not lose their support due to strategic voting) or close to 0 (when second losers are sufficiently far behind first losers that strategic voting kicks in and they are reduced to their noninstrumental support level, which I assume to be close to 0 for most candidates). The SF distribution, in other words, should be bimodal.

I have tested this bimodality hypothesis empirically in the case of Japan, using district-level electoral returns over the period 1958–90. The procedure, in the case of three-seat districts, was as follows. First, I computed the ratio of the vote total of the second loser (fifth-place candidate) to the vote total of the first loser (fourth-place candidate) for all districts with at least five candidates. Then, I produced a histogram to summarize the distribution of the resulting SF ratios (Figure 1). Results for four- and five-seat districts (the other frequently occurring types of district in Japan) are given in Figures 2 and 3.

As can be seen, the SF distribution is bimodal in each case. Values near .5 are rare, relative to those near 1 or 0; that is, it is much more common to have either a close or a distant second loser than an "in-between" second loser. Moreover, the closer the first loser to the last winner, the more likely a few more votes might change the outcome, the further

from .5 is the SF ratio (i.e., the stronger is the tendency for the ratio to be either near 1 or near 0).

Are the distributions displayed in Figures 1-3 significantly bimodal? One can reject the null hypothesis that the distribution is unimodal in the first two cases, using dip or depth tests (see Hartigan and Hartigan 1985). In the third case, the probability of observing the degree of bimodality visible in Figure 3 is a bit below .2, under the null hypothesis that the distribution is really unimodal. Thus there is some reason to doubt that the distribution is unimodal, but the evidence is not conclusive at conventional levels of statistical significance. Using a kernel densitybased test proposed by Silverman (1981), one can pit the null hypothesis of bimodality against the compound alternative of more than two modes. Doing so, one finds p-values of .22, .26, and .98 for the first, second, and third figures respectively. Thus one cannot reject the null of bimodality (in favor of multimodality) at conventional levels of significance. All told, the evidence is as it appears to be to the naked eye: the first two figures really are bimodal, and the third is harder to call but has some tendency toward bimodality.

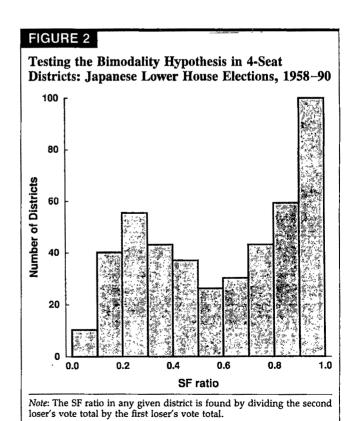

Substantively, does all this mean that one can reject the null hypothesis of sincere voting? It all depends on what one believes the distribution of voters' true preferences over candidates is. If one believes that second losers' true support tends to be either almost equal to, or much less than, first losers' true support, then the evidence presented here is consistent with sincere voting. I can see no reason for such an expectation regarding the distribution of preferences,

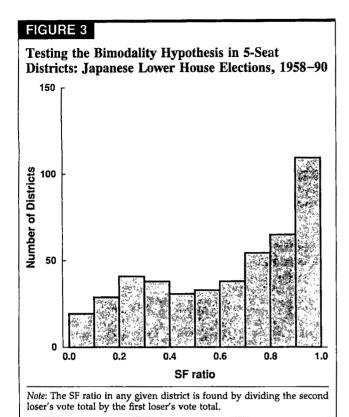

however, and accordingly take the statistical tendency toward bimodality to be evidence of strategic voting.

A second-order pattern that appears in the data is that the height of the mode near 0 declines with district magnitude. My interpretation of this is that the quality of voter information regarding candidate chances declines with district magnitude. In particular, it is harder to be sure who is trailing in a more crowded field in which very small vote percentages can win a seat. Whether this notion will hold up to scrutiny is a topic for further investigation.

Evidence that Japanese voters strategically desert leading candidates (those with more support than they need) is much less compelling than that they desert weak candidates. There is rarely anything like a dead heat among the top M candidates in a Japanese district, nor is there any movement toward such an ideal over time. Nonetheless, there is some evidence consistent with the model: (1) there is an over-time trend within the dominant Japanese party, the Liberal Democrats, toward fewer seats being lost on account of votes "wasted" on strong candidates (Cox and Niou 1994); (2) there is a statistically discernible tendency for fewer votes to be "wasted" on leading candidates when the margin of victory of the last winning candidate is narrower (indicating that votes switched from leading to marginal candidates are more likely to affect the outcome).

This last point is documented via an ordinary least squares regression, the results of which are reported in Table 1. The dependent variable, EXCESS, measures how far a particular district's race departs from the

theoretical prediction that the vote percentages of the top M candidates will be the same. It is computed by calculating, for each of the top M-1 finishers, the excess vote percentage they garner over that obtained by the Mth-place finisher and then adding the resulting M - 1 figures. For example, in a three-seat district in which the top three candidates get 30%, 25%, and 20%, excess = (30 - 20) + (25 - 30) = 15. The main independent variable in the analysis is MARGIN, equal to the vote percentage of the last winning candidate less that of the first losing candidate. The theoretical expectation is that smaller margins of victory will lead to fewer excess votes, since smaller margins indicate a better chance that votes currently wasted on leading candidates might affect the race between the marginal candidates, if transferred there. 10 Because five-seat districts have four candidates above the Mth place while four-seat districts have three and three-seat districts only two, one expects more excess votes in larger-magnitude districts. It thus makes sense to control for district magnitude, which is done via two dummy variables.

Examining the results diplayed in Table 1, one finds a positive and statistically significant effect: a 1% reduction in the margin of victory of the last winner produces, on average, nearly a .5% reduction in votes wasted on leading candidates. There is thus a mild tendency for closeness in the race for the last seat in a district to reduce the number of votes wasted on strong candidates, even if there are still quite a few such wasted votes cast.

Alternative Explanations

Although the model of strategic voting generates empirically testable predictions, some of which are new (in the sense that they have not been noticed in the previous literature), there are also some obvious alternative explanations that might explain the pattern of evidence just uncovered. The problem is that any class of agents who care about the outcome of the election (not just voters but also activists, contributors, and candidates) will tend to allocate whatever resources they control (labor, money, etc.) to marginal candidates, where they are more likely to affect the outcome, rather than to trailing or leading candidates, where they are less likely to affect the outcome. Moreover, allocation or reallocation of resources to marginal candidates should produce the clearest aggregate results (trailing candidates deprived of all instrumental support, leading candidates of excess instrumental support) when who is marginal and who is nonmarginal is widely agreed and the margin of victory is small. Thus, the empirical evidence adduced is far from proving that a significant proportion of the electorate is instrumentally motivated and in reasonable agreement on the relative standing of the candidates. It may be that contributors give only (or mostly) to marginal candidates, that trailing candidates try to sell their endorsement to marginals, or that leading candidates sell some of their excess support to marginals.

The elite-level hypotheses have some distinct advantages. First, it is more plausible that elite actors, having larger stakes in the outcome, will pay attention to how close the race is and respond by diverting resources to marginal candidates. Put negatively, it is unlikely that ordinary voters will pay any attention at all, since their single votes have an infinitesimal chance of affecting the outcome. If it is at all costly to

TABLE 1
Closeness Depresses Excess Votes: Japanese Lower House Elections, 1958–90

INDEPENDENT VARIABLE	DEPENDENT VARIABLE: EXCESS			
	COEFFICIENT ESTIMATE	STANDARD ERROR		
Constant Margin	7.27 .44	.35 .04		
Dummy for 4-seat districts Dummy for 5-seat	2.77	.42		
districts	5.41	.43		

Note: Adjusted $R^2 = .12$; N = 1,483. The variables are defined as follows. The unit of observation is an election in a particular district. Let V_j be the vote percentage garnered by the candidate placing jth in the poll in that district and let M be the district magnitude. Then (1) Excess = $\sum_{j=1}^{M-1} (V_j - V_{M})$, (2) Margin = $V_M - V_{M+1}$, (3) Dummy for 4-seat districts = 1 if M = 4 (0 otherwise), and (4) Dummy for 5-seat districts = 1 if M = 5 (0 otherwise). As an example of the computation of Excess, consider a three-seat district in which the top three candidates receive 30%, 25%, and 20% of the vote. In this district, Excess = (30 - 20) + (25 - 20) = 15. The equation is estimated by ordinary least squares.

find out who is marginal or to calculate expected utilities, rational voters should avoid these costs, since bearing them has virtually no impact on the outcome (Meehl 1977; Riker 1982).

Second, the elite models look as if they can better accommodate the rather substantial amount of votes wasted on leading candidates. Contributors who seek "access" or specific postelection favors will stick with leading but not with trailing candidates. Leading candidates have something to lose if they sell off "too much" excess support, while trailing candidates, for all intents and purposes, do not.

Nonetheless, despite the apparent advantages of elite-based models, it is not clear that one can reject the voter-based model. The informational and cognitive costs of strategic voting are modest and may be borne entirely as byproducts of everyday activities, such as reading the newspaper, watching television, or attending college courses in politics. Information on the relative standings of candidates is sometimes published in polls; it does not take a rocket scientist to understand traditional wasted-vote arguments, and these arguments are sometimes hard to avoid (being urged by concerned elites). All this suggests that voters in the real world may strategically desert weak candidates for essentially the reasons stylized in the model. It is true that the whole process is mediated by elites: they point out that the race is close and that votes on weak candidates are wasted. But the voters do the rest: they buy the argument and act accordingly. Empirically, I think that there is overwhelming evidence that voters have, in a variety of historical and electoral contexts, voted strategically in this sense (see Cox 1991). The question of the relative importance of strategic reallocation of votes in the mass electorate as opposed to strategic reallocation of other resources in the elite strata remains open, however. And the evidence for strategic desertion of leading candidates is another story entirely. Elites in Japan do not seem to point out that votes for a sure winner are wasted, and there is no direct evidence at present that voters act as if they knew.

CONCLUSION

I have investigated strategic voting equilibria in multimember districts operating under SNTV, building on the previous work of Cox (1987), Palfrey (1989), and Myerson and Weber (1993). "Strategic voting" in single-member districts refers to a voter deserting a more preferred candidate with a poor chance of winning for a less preferred candidate with a better chance at winning. In multimember districts, voters who care only about the outcome of the election will strategically desert both candidates who are "too weak" and candidates who are "too strong." Such outcome-oriented voters desert weak candidates in multimember districts for the same reason as in single-member districts. They desert strong candidates when those candidates have one of the M seats sewn up but there are other seats still up for grabs; for then the voter's vote has a much greater chance of affecting the outcome if cast for one of the "marginal" candidates—those on the edge between winning and losing. All told, instrumentally motivated voters under SNTV waste their votes neither on weak (submarginal) nor on strong (supermarginal) candidates.

ginal) nor on strong (supermarginal) candidates.

Equilibria of a "frictionless" model of strategic voting under SNTV—in which all voters are instrumentally motivated and all have rational expectations—are such that all wasted votes are wrung out of the system. As far as wasting votes on supermarginal candidates goes, this means that all winning candidates must be in a virtual dead heat in equilibrium, so that none will be perceived as having any "excess" votes that might profitably be transferred elsewhere. This prediction fares poorly in the Japanese data, although there is a tendency for fewer votes to be wasted on supermarginal candidates as the gap between last winner and first loser narrows.

Wringing out all votes wasted on submarginal candidates produces either Duvergerian outcomes (in which strategic voting erodes the support of all but one serious challenger, so that there are M+1 viable candidates all told) or non-Duvergerian outcomes (in which two or more serious challengers are so closely matched that none becomes the unique victim of strategic desertion and more than M + 1 viable candidates survive). Empirically, outcomes with M +1 viable candidates occur rather frequently. Thus, Duverger (1955) saw a tendency toward two-partyism in electoral systems employing single-member districts, while Reed (1991) saw a tendency for there to be four viable candidates in three-member districts, five viable candidates in four-member districts, and six viable candidates in five-member districts.

Both Duverger and Reed, of course, appealed to strategic voting (among other things) in explaining the observed tendency toward M + 1 viable candidacies (the M + 1 rule). The present model's utility is in illuminating some of the logical prerequisites and consequences of explaining the M + 1 rule in terms of strategic voting. As to prerequisites, the model shows that the degree to which strategic voting will winnow out weak candidates depends on how many instrumentally motivated voters there are and on how consistent their expectations about the relative standings of the candidates are. The empirical approximation of both these conditions plausibly depends on elite action and propaganda. American third-party movements (Ross Perot included) frequently emphasize future election outcomes: "We may have no real chance this time," they say, "but vote for us anyway, send a message, and help restructure American politics." The established party most hurt by the third party's appeals, in turn, is apt to emphasize the electoral here and now—the instrumental motivations highlighted in the present model. Similarly, elite actions determine how consistent voter beliefs are regarding who is winning and who is losing. If clear information about candidate chances is provided to voters, one can expect substantial strategic voting and a consequent reduction in the number of viable candidacies. If little (or conflicting) information is provided to voters, then greater amounts of sincere voting (or cross-cutting strategic voting) can be expected, and the tendency toward M+1 viable candidates will be weaker.

As to the logical consequences of explaining the M+1 rule in terms of strategic voting, the model provides specific and empirically testable predictions about what kind of exceptions to the M+1 rule one should expect. Neither Duverger nor Reed do this. Both readily admit the possibility of exceptions to their generalizations: Duverger's Law and Reed's extension of it are both stated as "tendencies." But neither says much about the nature of the exceptions. Here, the theoretically allowable exceptions to the M+1 rule have been characterized as various kinds of near ties, and a general implication of these exceptions (embodied in the bimodality hypothesis) has been tested with Japanese data.

There are of course other possible avenues to explore in explaining the M + 1 rule. Both Duverger and Reed appropriately suggest that elites may get into the act. Meehl (1977) and Riker (1982) argue that voters have too small a stake in elections to motivate strategic voting and emphasize elite actors even more strongly. Here I have noted that strategic reallocation of resources by outcome-oriented elite actors (activists, contributors, candidates) should produce many of the same aggregate patterns as identified in the voters-only model. My personal bias is strongly toward the elite-level hypotheses, as it is in the study of turnout (Cox and Munger 1989). I think strategic voting survives, both in theory and in practice, because one of the things outcome-oriented elites can do in close races to reallocate resources from nonmarginal to marginal candidates is to flood the mass media with wasted-vote arguments (including therein both the relevant evidence on candidate standings and the basic logic motivating a strategic vote). Finally, it should be noted that the basic model constructed here can be adapted to other electoral systems operating in multimember districts—in particular, to various forms of proportional representation. I intend to demonstrate this more fully in future work.

APPENDIX A: THE VOTER'S DECISION PROBLEM

I consider how a voter motivated solely by a desire to affect the outcome of the election decides whom to vote for, given that the voter votes. There are three parameters in the voter's decision (subscript is are suppressed): (1) the voter's preferences over the candidates, given by $u = (u_1, \ldots, u_K) \in U$; (2) the voter's expectations about how well each candidate will do at the polls, given by $\pi = (\pi_1, \ldots, \pi_K)$; and (3) the number of voters, n. I shall denote by $V(u; \pi, n) \subseteq K$ the optimal vote(s) of a voter of type u facing an electorate described by π and n. I shall show that the parameters identified are indeed sufficient to

yield a well-defined decision problem and reveal such of the technical details of solving this problem as are necessary for proving the theorem to come.

Letting V_j denote the number of votes received by candidate j from voters other than the focal voter, the focal voter views (V_1, \ldots, V_K) as K-nomial random variables with parameters π and n-1. Thus, each voter's beliefs about the probabilities of various events (such as ties or near ties among the candidates) can be calculated using standard multinomial formulas. The details of this are given in Appendix B. Here, I shall simply assume that the probabilities of all events mentioned are known by the voter.

In particular, the focal voter knows, for all j and $k:W_j$, the probability that candidate j wins a seat outright (i.e., $|\{h \in K: V_h \geq V_j \text{ and } h \neq j\}| \leq M-1$), and T_{jk} , the probability that candidates j and k are in a two-way tie for Mth place (i.e., $|\{h \in K: V_h > V_j\}| = M-1$ and $|\{h \in K: V_h = V_j\}| = 2$). Following Hoffman (1982) and Myerson and Weber (1993), I assume that for large n, the perceived probability of an r-way tie for Mth, r > 2, is infinitesimal in comparison to the probability of a two-way tie for Mth. With this assumption, the focal voter's expected utility from abstaining, given u, π , and n, can be approximated with infinitesimal error by

$$\sum_{j=1}^K W_j u_j + \sum_{j=1}^K \sum_{k>j} T_{jk} \left(\frac{u_j + u_k}{2} \right),$$

where various terms involving r-way ties for Mth, r > 2, that are asymptotically negligible in comparison to the largest T_{ik} , have been omitted.

By voting for candidate j, the focal voter can affect his or her utility in two ways (continuing to ignore r-way ties, r > 2)—by putting j into a tie with k (yielding a utility increment of $(u_j + u_k)/2 - u_k$) or by breaking a tie between j and k (yielding a utility increment of $u_j - (u_j + u_k)/2$). Assuming (following Hoffman 1982 and Myerson and Weber 1993) that the probability of the event "k is in k-mth place, tied with k-given k

$$\xi_j = \sum_{k=1}^K T_{jk}(u_j - u_k).$$

Thus,

$$V(u; \pi, n) = \underset{j \in K}{\operatorname{arg max}} \, \xi_j.$$

APPENDIX B: MULTINOMIAL PROBABILITIES

I shall use the following notation throughout:

R = the set of real numbers;

Q = the set of rational numbers;

 \overline{Z} = the set of nonnegative integers;

 ϕ = the standard normal density function;

 $K = \{1, \ldots, K\}$, the set of candidates; V_1, \ldots, V_K are K-nomially distributed random variables with parameters $\pi_1 \geq \pi_2 \geq \ldots \geq \pi_K$ and m; T_{jk} = probability that candidates j and k are tied for

Mth place, 0 < M < K; and $\Delta^{K-1} = \{(p_1, \dots, p_K) \in \mathbb{R}^K : 0 \le p_h \le 1 \text{ for all } h \& \Sigma p_h = 1\}$, the simplex in K-space.

I shall explore the asymptotic properties of the tie-probabilities T_{jk} . These probabilities can be expressed as follows. For any set $S \subseteq K$, |S| = M - 1, let up_j(S) denote the event $\bigcap_{i \in S} V_i > V_j$, down_j(S) denote the event $\bigcap_{i \in S} V_i < V_j$, and $E_{jk}(S) = \text{up}_j(S) \cap \text{down}_j(K \setminus S \setminus j, k) \cap V_j = V_k$. In words, $E_{jk}(S)$ is the event "the M-1 candidates in S finish ahead of j and k, j and k are tied for Mth, and all other candidates finish below j and k." With these definitions,

$$T_{jk} = \sum_{b=1}^{\binom{K-2}{M-1}} \Pr[E_{jk}(S_{jk}^b)],$$

where the sets S_{ik}^b all have M-1 elements and correspond to the different ways of selecting which M-1 candidates—from the K-2 that remain after removing j and k—will have vote totals exceeding j's. The only one of these sets that it is necessary explicitly to define is

$$S^1_{jk} = \begin{cases} \{1, \, \ldots \, , \, M-1\} & \text{if} \quad j \geq M \\ \{1, \, \ldots \, , \, M\} \backslash \{j\} & \text{if} \quad j < M < k \\ \{1, \, \ldots \, , \, M+1\} \backslash \{j, \, k\} & \text{if} \quad k \leq M. \end{cases}$$

than j and k. The next lemma is useful in showing that $\Pr[E_{ik}(S_{ik}^1)] \ge \Pr[E_{ik}(S_{ik}^b)]$ for all b.

LEMMA 1. Suppose K > M + 1 and consider any $A \subset K$ $\{j, k\}$ such that |A| = M - 1. Denote the complement of A in $K\setminus\{j,k\}$ by A^c . Suppose there exists $d\in A$, $u\in$ A^{c} , such that $\pi_{u} > \pi_{d}$, and define $B = A \setminus \{d\} \cup \{u\}$. Then $Pr[E_{ik}(A)] < Pr[E_{ik}(B)]$.

Proof. Note that

$$\Pr[E_{jk}(A)] = \sum_{v \in \bar{E}_{jk}(A)} P(v),$$

where

$$P(v) = m! \prod_{j=1}^{K} \frac{\pi_j^{v_j}}{v_j!}$$

and

$$\tilde{E}_{jk}(A) = \left\{ v \in Z^K: \bigcap_{h \in K} V_h = v_h \in E_{jk}(A) \right\}.$$

Consider any term $v \in \tilde{E}_{jk}(A)$. The vector v', defined by $v_h' = v_h$ for $h \notin \{d, u\}$, $v_d' = v_u$, and $v_u' = v_d$, is an element of $\bar{E}_{jk}(B)$. Moreover, $P(v)/P(v') = (\pi_d/\pi_u)^{V_d-V_u}$ ≤ 1 (recall that $\pi_d < \pi_u$ and $v_d > v_u$ since $v \in \tilde{E}_{ik}(A)$).

COROLLARY 1. $Pr[E_{ik}(S_{ik}^1)] \ge Pr[E_{ik}(S_{ik}^b)]$ for all b.

I omit the proof: it follows directly from Lemma 1. In what follows, I shall abbreviate $E_{ik}(S_{ik}^1)$ by E_{ik} .

LEMMA 2. Let a, b, and c be elements of K such that either (1) $a < M \text{ and } a < b \le M + 1 \text{ and } (b = M + 1 \rightarrow c)$ \leq M) and $\pi_a > \pi_b$ or (2) a > M + 1 and $M \leq b < a$ and $(b = M \rightarrow c \ge M)$ and $\pi_a < \pi_b$. Then $\lim_{m \to \infty}$

Proof. By Corollary 1, it suffices to show that $\lim_{m\to\infty}$ $Pr[E_{ca}]/Pr[E_{cb}] = 0$. The proof proceeds separately for the two cases. In case 1, note that a < M implies $a \in$ S_{cb}^1 . Note also that $b \leq M$ implies $b \in S_{ca}^1$, since

$$S^1_{ca} = \begin{cases} \{1, \dots, M\} \setminus \{a\} & \text{if } M < c \\ \{1, \dots, M+1\} \setminus \{a, c\} & \text{if } c \le M. \end{cases}$$

When b = M + 1, moreover, $c \le M$ by hypothesis, and hence $b \in S_{ca}^1$ again. In light of these observations, one can write $E_{ca} = E \cap (V_b > V_c = V_a)$ and $E_{cb} = E \cap (V_a > V_c = V_b)$, where $E = \text{up}_c(S_{ca}^1 \cap S_{cb}^1) \cap \text{down}_c(K \setminus S_{ca}^1 \cap S_{cb}^1) \setminus \{a, b, c\}$.

Let $\pi_{h,a} = E(V_h/m|E_{ca})$ and $\pi_{h,b} = E(V_h/m|E_{cb})$. Note that $\pi_h > 0$ implies $\pi_{h,a} > 0$ and $\pi_{h,b} > 0$. Let $\sigma_{h,a}$ and $\sigma_{h,b}$ denote the conditional standard deviations. Note that they are both finite and that both approach zero as m approaches infinity. Thus the distribution of $(V_1/m, \ldots, V_K/m)$, conditional on E_{ca} , collapses around its mean; that is, for any $\varepsilon > 0$,

$$\lim_{m \to \infty} \Pr[\bigcap_{h=1}^{K} (\pi_{h,a} - \varepsilon < V_h | m < \pi_{h,a} + \varepsilon) | E_{ca}] = 1.$$

A similar statement can be made for the distribution of $(V_1/m, \ldots, V_K/m)$ conditional on E_{cb} . Let *S* be the event

$$\bigcap_{h=1}^{K} \frac{V_h}{m} > \min \left\{ \pi_{h,a}, \ \pi_{h,b} \right\} - \varepsilon.$$

Note that because

$$S \supseteq \bigcap_{h=1}^{K} (\pi_{h,a} - \varepsilon < V_h/m < \pi_{h,a} + \varepsilon),$$

$$\lim_{m\to\infty} \Pr[S|E_{ca}] = 1.$$

Similarly.

$$\lim_{m\to\infty} \Pr[S|E_{cb}] = 1.$$

In light of these results,

$$\lim_{m\to\infty}\frac{\Pr[E_{ca}\cap S^c]}{\Pr[E_{ca}\cap S]}=\lim_{m\to\infty}\frac{\Pr[E_{ca}](1-\Pr[S|E_{ca}])}{\Pr[E_{ca}]\Pr[S|E_{ca}]}=0.$$

Thus since

$$\frac{\Pr[E_{ca}]}{\Pr[E_{cb}]} = \frac{\Pr[E_{ca} \cap S] + \Pr[E_{ca} \cap S^c]}{\Pr[E_{cb} \cap S] + \Pr[E_{cb} \cap S^c]},$$

it suffices to show that

$$\lim_{m\to\infty}\frac{\Pr[E_{ca}\cap S]}{\Pr[E_{cb}\cap S]}=0.$$

But

$$\frac{\Pr[E_{ca} \cap S]}{\Pr[E_{cb} \cap S]} = \frac{\Pr[E|S] \sum_{p \in \Xi} f_m(p)}{\Pr[E|S] \sum_{p \in \Xi} g_m(p)},$$

where

$$f_m(p) = \Pr[\bigcap_{h \in W} V_h = p_h m | E \cap S] \Pr[V_b > p_c m]$$

$$= V_a | \bigcap_{h \in W} V_h = p_h m],$$

$$g_m(p) = \Pr[\bigcap_{h \in W} V_h = p_h m | E \cap S] \Pr[V_a > p_c m]$$

$$= V_b | \bigcap_{h \in W} V_h = p_h m],$$

$$\Xi = \{ p \in \Delta^{K-1} \cap Q^K : \bigcap_{h \in W} V_h \}$$

 $= p_h m \subseteq E \cap S$ for some $m \in \mathbb{Z}$ and

 $W=K\backslash\{a,\,b\}.$

Fix $p \in \Xi$ and consider the limit as m approaches infinity of $f_m(p)/g_m(p)$. Note that

$$\frac{f_m(p)}{g_m(p)} =$$

$$\begin{cases} 0/0 & \text{if } p \notin \Xi_m \\ \Pr[V_b > p_c m = V_a | \bigcap_{h \in W} V_h = p_h m] \\ \frac{h \in W}{\Pr[V_a > p_c m = V_b | \bigcap_{h \in W} V_h = p_h m]} & \text{if } p \in \Xi_m, \end{cases}$$

where $\Xi_m = \{ p \in \Xi : p_h m \in Z \text{ for all } h \in W \}$. Note also that

$$\lim_{\substack{m\to\infty\\m\in\Xi^{-1}(p)}}\frac{f_m(p)}{g_m(p)}=0,$$

where

$$\Xi^{-1}(p) = \{ m \in \mathbb{Z} : p \in \Xi_m \},$$

This last result is derived as follows. Let $v_h = p_h m$ for all h. Conditional on $\bigcap_{h \in W} V_h = v_h$, V_a and V_b are distributed binomially, with parameters $\pi_a^* = \pi_a/(\pi_a + \pi_b)$, $\pi_b^* = \pi_b/(\pi_b + \pi_a)$, and $m^* = m - \Sigma_{h \in W} v_h$. If $2v_c$

 $\geq m^*$, then both probabilities are zero. Conditional on $2v_c < m^*$, we have $(V_a = v_c \rightarrow V_b > v_c)$ and $(V_b = v_c \rightarrow V_a > v_c)$, since $V_a + V_b = m^* > 2v_c$. Thus (the condition $m \in \Xi^{-1}(p)$ being understood in all that follows)

$$\lim_{m \to \infty} \frac{f_m(p)}{g_m(p)} = \lim_{m \to \infty} \frac{\Pr[v_c = V_a | \bigcap V_h = v_h]}{\Pr[v_c = V_b | \bigcap V_h = v_h]}$$

$$= \lim_{m \to \infty} \frac{\phi(v_c - m^* \pi_a^* / \pi_a^* (1 - \pi_a^*))}{\phi(v_c - m^* \pi_b^* / \pi_b^* (1 - \pi_b^*))}$$

$$= \lim_{m \to \infty} \exp \left\{ \frac{(v_c - m^* \pi_b^*)^2 - (v_c - m^* \pi_a^*)^2}{\pi_a^* (1 - \pi_a^*)} \right\}.$$

The last limit equals 0 because

$$\lim_{m\to\infty} v_c^2 - 2v_c m^* \pi_b^* + (m^* \pi_b^*)^2 - (v_c^2 - 2v_c m^* \pi_a^*)^2$$

$$+ (m^* \pi_a^*)^2) = \lim_{m \to \infty} (m^*)^2 (\pi_a^* - \pi_b^*) \left(\frac{2v_c}{m^*} - 1 \right) = -\infty.$$

The last equality follows because $m^* > 2v_c = 2p_c m$ and $p_c > 0$. Thus, $\lim m^* = \infty$, while the second term is a positive constant and the third term a negative constant.

In case 2, a > M + 1 implies $a \notin S_{cb}^1$. Moreover, since

$$S_{ca}^{1} = \begin{cases} \{1, \dots, M-1\} & \text{if } M \leq c \\ \{1, \dots, M\} \setminus \{c\} & \text{if } c < M, \end{cases}$$

 $b \ge M+1$ and b=M (since this entails $c \ge M$) both imply $b \notin S_{ca}^1$. In light of these observations, one can write $E_{ca}=E\cap (V_c=V_a>V_b)$ and $E_{cb}=E\cap (V_c=V_b>V_a)$, where $E=\operatorname{up}_c(S_{ca}^1\cap S_{cb}^1)\cap\operatorname{down}_c(K\backslash S_{ca}^1\cap S_{cb}^1\backslash a,b,c)$.

Given these definitions, the proof here proceeds identically to that in the first case if one substitutes the string $p_c m = V_a > V_b$ for every occurrence of the string $V_b > p_c m = V_a$ and the string $p_c m = V_b > V_a$ for every occurrence of the string $v_a > p_c m = V_b$. Somewhat larger changes are needed when one examines the limit of the ratio $f_m(p)/g_m(p)$, where, in this case,

$$\frac{f_m(p)}{g_m(p)} =$$

$$\begin{cases} 0/0 & \text{if } p \notin \Xi_m \\ \Pr[p_c m = V_a > V_b | \lim_{h \in W} V_h = p_h m] \\ \frac{h \in W}{\Pr[p_c m = V_b > V_a | \lim_{h \in W} V_h = p_h m]} & \text{if } p \in \Xi_m. \end{cases}$$

Conditional on $\bigcap_{h \in W} V_h = v_h$, V_a and V_b are distributed binomially, with parameters $\pi_a^* = \pi_a/(\pi_a + \pi_b)$, $\pi_b^* = \pi_b/(\pi_b + \pi_a)$, and $m^* = m - \Sigma_{h \in W} V_h$. If $m^* < v_c$ or $m^* \ge 2v_c$, then both probabilities are zero. Condi-

tional on $v_c \le m^* < 2v_c$, we have $(V_a = v_c \to V_a > V_b)$ and $(V_b = v_c \to V_b > V_a)$. Thus (the condition $m \in \Xi^{-1}(p)$ being understood in all that follows),

$$\lim_{m \to \infty} \frac{f_m(p)}{g_m(p)} = \lim_{m \to \infty} \frac{\Pr[v_c = V_a | \lim_{h \in W} V_h = v_h]}{\Pr[v_c = V_b | \lim_{h \in W} V_h = v_h]}$$

$$= \lim_{m \to \infty} \frac{\phi(v_c - m^* \pi_a^* / \pi_a^* (1 - \pi_a^*))}{\phi(v_c - m^* \pi_b^* / \pi_b^* (1 - \pi_b^*))}$$

$$= \lim_{m \to \infty} \exp\left\{ \frac{(v_c - m^* \pi_b^*)^2 - (v_c - m^* \pi_a^*)^2}{\pi_a^* (1 - \pi_a^*)} \right\}.$$

The last limit equals zero because

$$\lim_{m \to \infty} v_c^2 - 2v_c m^* \pi_b^* + (m^* \pi_b^*)^2 - (v_c^2 - 2v_c m^* \pi_a^*) + (m^* \pi_a^*)^2 = \lim_{m \to \infty} (m^*)^2 (\pi_a^* - \pi_b^*)(2v_c m^* - 1) = -\infty.$$

The last equality follows because $m^* < 2v_c$ (so the last term is a positive constant), the second term is a negative constant, and $m^* \ge p_c m > 0$ (so $\lim m^* = \infty$).

LEMMA 3. (a) If $\pi_1 > \pi_M$, then $\lim_{m \to \infty} T_{1j} / T_{M,M+1} = 0$ for all j. (b) If $0 < \pi_j < \pi_{M+1}$ for some j > M+1, then $\lim_{m \to \infty} T_{jk} / T_{M,M+1} = 0$ for all k.

Proof Part 1. By Corollary 1, it suffices to show that $\lim_{m\to\infty}\Pr[E_{1j}]/\Pr[E_{M,M+1}]=0$ for all j. And this follows because (1) $\lim_{m\to\infty}\Pr[E_{1j}]/\Pr[E_{1M}]=0$ for all j< M (by Lemma 2, case 1); (2) $\lim_{m\to\infty}\Pr[E_{1j}]/\Pr[E_{1,M+1}]=0$ for all j>M+1 (by Lemma 2, case 2); (3) $\lim_{m\to\infty}\Pr[E_{1M}]/\Pr[E_{M,M+1}]=0$ (by Lemma 2, case 1); and (4) $\lim_{m\to\infty}\Pr[E_{1,M+1}]/\Pr[E_{M,M+1}]=0$ (by Lemma 2, case 1).

Proof Part 2. By Corollary 1, it suffices to show that $\lim_{m\to\infty} \Pr[E_{jk}]/\Pr[E_{M,M+1}] = 0$ for all k. And this follows because (1) $\lim_{m\to\infty} \Pr[E_{jk}]/\Pr[E_{j,M+1}] = 0$ for all k > M + 1 (by Lemma 2, case 2); (2) $\lim_{m\to\infty} \Pr[E_{jk}]/\Pr[E_{jM}] = 0$ for all k < M (by Lemma 2, case 1); (3) $\lim_{m\to\infty} \Pr[E_{j,M+1}]/\Pr[E_{M,M+1}] = 0$ (by Lemma 2, case 2); and (4) $\lim_{m\to\infty} \Pr[E_{jM}]/\Pr[E_{M,M+1}] = 0$ (by Lemma 2, case 2). QED.

Proof of Theorem 1. Suppose $\pi_1 > \pi_M$ and consider a voter of type u. Let $X_j = \{k \in K: \pi_k = \pi_j\}$ and call any candidate in $X_M \cup X_{M+1}$ "marginal." Let h be the marginal candidate whom the voter ranks highest: $u_h > u_j$ for all $j \in X_M \cup X_{M+1} \setminus \{h\}$. (Such a candidate exists because all voters have strict preferences among candidates.)

Now consider ξ_h^n , the expected utility increment of voting for h rather than abstaining, when the electorate is of size n. From Appendix A. $\xi_h^n = \sum_{k=1}^{K} \frac{T_h^n(u_k - u_k)}{T_h^n(u_k - u_k)}$

given π). Note that $\xi_h^n>0$ for all n, because (1) in the limit, ties between marginal candidates dominate those involving nonmarginal candidates, by Lemma 2 and (2) $u_h-u_k>0$ for all $k\in X_M\cup X_{M+1}\setminus\{h\}$. Note also that $\lim \xi_1^n/\xi_h^n=0$, by Lemma 3. (One can assume without loss of generality that $h\leq M+1$, since $h\in X_M\cup X_{M+1}$.) Thus, in the limit, no voter will vote for candidate 1, given expectations π , which contradicts the expectation that $\pi_1>0$. This shows that for large enough n, π is not a rational expectation. But there may be rational expectations arbitrarily close to π .

In order to show that one cannot find any rational expectations "close" to π , consider a sequence $\{\pi^n\}$ of rational expectations that converges to π . The discussion leading up to Lemma 1, and the proof of that lemma, show that

$$T_{hk}^{n} = \sum_{b=1}^{\binom{M-1}{K-2}} \sum_{v \in E_{ak}(S_{hk}^{b})} (n-1)! \prod_{j=1}^{K} \frac{\pi_{j}^{v_{j}}}{v_{j}!},$$

where

$$\bar{E}_{hk}(S_{hk}^b) = \{ v \in Z^K : \lim_{h \in K} V_h = v_h \in E_{hk}(S_{hk}^b) \}.$$

Thus T_{hk}^n is a continuous function of π , and so is ξ_h^n . Let $\xi_h^n(\pi^n)$ be the expression resulting when one substitutes π^n for π in the expression for ξ_h^n . The continuity of ξ_h^n in π , together with $\pi^n \to \pi$ and $\xi_h^n > 0$ for all n, implies $\xi_h^n(\pi^n) > 0$ for all n sufficiently large. The ratio ξ_h^n/ξ_h^n is continuous in π , over the set of all π such that ξ_h^n is not zero. Thus $\lim_{n \to \infty} \xi_h^n(\pi^n)/\xi_h^n(\pi^n) = \lim_{n \to \infty} \xi_h^n/\xi_h^n = 0$, the latter equality having been established above; that is, in sufficiently large electorates with expectations sufficiently close to π , no voter will vote for candidate 1, contrary to the assumption that $\pi_1 > 0$. A similar proof works for the other part of the theorem.

Notes

I thank Skip Lupia, Barry Nalebuff, Tom Palfrey, and especially Roger Myerson for their helpful comments. Thanks also to Jonathan Katz for suggesting and coding the Silverman bimodality tests conducted in the fourth section. This work was supported by the National Science Foundation under grant number SES-9208753.

1. The Japanese and Taiwanese require that a candidate get above a legally defined minimum vote share in order to win a seat. The seat allocation rule, in other words, is not pure plurality. Nonetheless, this provision is of negligible practical importance.

2. The adjective strategic in strategic voting equilibria is really superfluous in that agents in the model conform to the usual postulate of rationality and are not distinctly more strategic than agents in any other rational choice model. The term strategic voting is well established in the literature, however, and I shall follow conventional usage.

3. Myerson and Weber (1993) suggest that considerations of dynamic consistency or persistence may eliminate the

- 5. Formally, the assumption is this. Let each voter order the candidates from largest π_{ij} to smallest. Let M(i) be the candidate ranked Mth in is ordering and M + 1(i) be the candidate ranked (M+1)st. Let $Mid(i)=\{j:\pi_{ij}=\pi_{iM(i)}$ or $\pi_{ij}=\pi_{iM+1(i)}\}$. Lead $(i)=\{j:\pi_{ij}>\pi_{iM(i)}\}$, and $Trail(i)=K\backslash Mid(i)\backslash Lead(i)$. Then, for all voters i and i, Lead(i)=Lead(i)and Trail(i) = Trail(h).
- 6. Because there are no atoms in the type distribution F_{r} nonsingleton $V(u; \pi, n)$ s do not require special handling.

7. I thank Roger Myerson and Barry Nalebuff for greatly

clarifying what this theorem ought to say.

8. Trailing candidates find allies in their attempts to avoid the logic of the wasted vote in front-runners who expect a net loss should the trailing candidacy go down the tubes (e.g., recall Ronald Reagan's support of John Anderson's candidacy in 1980) and foes in front-runners who expect a net gain of support (recall Jimmy Carter's persistent reminders to voters not to waste their vote on Anderson).

9. The data used in this analysis are from Steven Reed's compendium Japan Election Data: The House of Representatives 1947-1990 (Ann Arbor: Center for Japanese Studies, 1992).

10. Note that there is an artifactual expectation of precisely the opposite character. Looking at the mathematical definitions of excess and MARGIN given in the notes to Table 1, one sees that V_M , the vote percentage of the Mth-place candidate, appears with a negative sign in the expression for EXCESS and with a positive sign in the expression for MARGIN. Thus one expects an artifactual negative relationship. If the theoretically expected positive relationship nonetheless appears, one can be more confident that it corresponds to some real political effect.

THE TOWER OF BABEL AS A COORDINATION GAME: POLITICAL LINGUISTICS IN GHANA

DAVID D. LAITIN University of Chicago

The problem of choosing an indigenous official language for multilingual states in general and for Ghana in particular is treated as one of coordination in an n-person tipping game. Even with an assumption that the equilibrium outcome of all-English is deficient, the mechanisms for reaching an indigenous language solution are difficult to find. A lottery (a theoretically attractive approach to the solution of coordination games) is less attractive when applied to the issue of language coordination. Empirical data based on interviews from six different regions of Ghana show the limits and possibilities of the theoretic solution. Going back to theory, a mechanism for the successful promotion of an indigenous language outcome is proposed.

od's punishment for the audacity of building the Tower of Babel sets up a neat n-person coordination game for the world's scattered peoples. Individuals from each language group may want to communicate directly with members from other language groups, but they have to agree upon a common language to do so.¹

In world history, the Babelian curse has been negotiated in a variety of ways. The most common solution is based on simple market conditions: high levels of contact between peoples of different language groups induce new speech forms, permitting intergroup communication. Over a long expanse (e.g., of a river or through a subcontinent), linguists have discovered language chains. People at point A communicate effectively but haltingly with neighbors at point B, who themselves communicate with their neighbors at point C, and so on; but people at point A cannot communicate at all with people at point N. Dialect chains are not the only solution; often pidgins or lingua francas help overcome the Babelian curse.² All these solutions are based on the microdynamics of language coordination across space and time, without state-enforced contracts or legislation.

Market solutions are not always efficient. Consider two separated language groups that due to a technological change (say, the spanning of a river by a bridge) form a unified economic region. Suppose all people in this region are monolinguals in one of two languages, L and L1. It may be Pareto efficient (especially if transfer payments are permitted) for speakers of L to switch to L1, or vice versa. Even if it were agreed which language was a better coordination point, however, it might require a critical mass of people to change before it would be rational for any single person to change. This is the core insight in Schelling's "tipping game" (1978, chap. 7). Without any stimulus for organizing a critical mass of L or L1 speakers to switch, a class of professionals (whose learning costs are lower than the average for the population) will likely emerge and charge for translation services. Over a few generations this will be a costlier solution than early agreement by all on a common language.

Rulers have an interest in promoting efficient language outcomes. The failure of the market to overcome the inefficiencies of the Babelian curse adds to the transaction costs of rule, if only because governmental monitoring of compliance to its laws is more costly if the rules themselves must be translated into a number of languages. It adds further to the costs of rule if agents of the ruler need to translate local documents such as account books (for purposes of taxation) into the language of rule. Rulers interfere in the marketplace of languages not only because the transactions costs of rule increase when the language coordination problem is unsolved but also because lowering the transactions costs of business internal to the state raises the taxable surplus (Friedman 1977).³

This helps explain why numerous rulers of states and empires have sought to manipulate language use in the societies they rule. Rationalization—the authoritative imposition of a single language for educational and administrative communications—is only one possible strategy (Laitin 1988). Other forms of managed coordination, such as language zoning in Switzerland and an administratively and educationally induced lingua franca in the former Soviet Union, are state-influenced coordination outcomes.

Rulers have an interest not only in lowering transaction costs within their boundaries but in raising those costs across boundaries. Solving the Tower of Babel curse within a boundary may amplify that curse internationally. Despite the apparent efficiency of a single-world language, however, it may not be a superior equilibrium to one in which each country (or region) specializes in a single language. Taking cues from work on the optimal size of firms (Williamson 1986, chap. 3) and on the potential efficiencies of the development of particularistic corporate cultures (Kreps 1990), I give more weight here to the issue of creating national cultures and less to the issue of an efficient world-language regime.

Rulers of states that experienced colonial rule and received their independence in the twentieth century have faced a far more difficult task in rationalizing language within their boundaries than leaders who consolidated states in earlier centuries. These twentieth-century leaders of new states have found that language issues are particularly volatile when they become politicized. I shall explain why coordination on an indigenous national language has been difficult for such leaders. I will focus on the language situation in Ghana, but the dynamics of the situation are similar for many multilingual African countries that lack any indigenous lingua franca that could serve as common language of education, administration, and public life (e.g., Zaire, Nigeria, Senegal, and Ivory Coast).⁴

My goals here go beyond a strategic analysis of why state-induced coordination on a national language is difficult to achieve. Through a detailed case study of Ghana's linguistic history and a survey of language use and attitudes, I shall illustrate the difficulty of applying in the real world certain theoretically elegant solutions to the Tower of Babel curse. Finally, I shall propose a linguistic strategy that, while not yielding language rationalization, does indeed permit the institutionalization of an indigenous national language in countries like Ghana.

GHANA: SOCIOLINGUISTIC BACKGROUND

Ghana in the 1950s was the African country with the strongest and most publicized national movement. Kwame Nkrumah, the charismatic leader of the Convention Peoples party and of Ghana itself, was a committed pan-Africanist. He believed that true freedom demanded that the roots of European domination be dug out. Yet he, like virtually all African nationalists, had to rely on a European language to make his message understood by at least some persons in each part of his country. His first language was Nzema, a language spoken by only a small percentage of the people of Gold Coast (the colonial appellation for today's Ghana). What sort of language policy was possible under conditions that Nkrumah faced? Ghana, like nearly all African countries, seems to have been a principal victim of God's wrath aimed against those who constructed the Tower of Babel.

Ghana had a population of 14.5 million in 1980. The official language (i.e., the language used in educational institutions and for conducting government business) is English. Akan speakers make up 44.1% of the population. (Twi, Fanti, Brong, Akim, and Nzema, are the principal languages of the Akan family.) The Mole-Dagbani of the North and Upper regions constitute 16%, the Ewe of Volta Region 13%, Ga-Adangbe of Greater Accra and parts of the Eastern Region 8.3%, the Guang of the East and parts of the North 3.7%, the Gurma of the North and Upper regions 3.5%, and the remaining groups (including the Kasem in the North) 11.4% (Chazan 1983, 35). Very few Ghanaians consider themselves to be Hausas; yet the Hausa language is broadly understood throughout the northern regions, as well as across the west African savanna; it is probably the most widely understood language in west Africa today.

Linguists point to the broad zone of Akan languages in Ghana's southern and middle belts-an area in which there have historically been significant political, social, and economic interactions among peoples. There was, at least during the period of Asante dominance in the precolonial era, reasonable mutual intelligibility among speakers of these Akan languages. But missionary and colonial policies (at least up through World War II), by providing educational and administrative benefits based on tribal boundaries, gave incentives for local chiefs to emphasize linguistic differences from their neighbors. Hence, from the late nineteenth century, a spiral of language differentiation ensued. By 1950, Akan speakers were more differentiated linguistically than they had been 100 years earlier (Dickens 1953).

The colonial state's language policy was not fully coherent. On the one hand, and consistent with the Colonial Office's view that rule could be cheaply administered if colonial administrators ruled indirectly through native chiefs, the colonial state sought to encourage basic education in mother tongues. This is why it gave in to demands of local chiefs for the official recognition of their languages. On the other hand, ease of administration demanded that a class of Ghanaians be literate in English. Thus, a mixed policy developed. In the primary schools, the vernaculars usually served as the media of instruction; but in the secondary schools, the medium became English (Kitchen 1962, 334–36).

The independence movement sought both to overcome the reliance on foreign cultures and to induce a more unified African or Ghanaian culture. A search for a Ghanaian national language was thought to be a sure remedy. But the independent state could find no more coherent language policy than that of the colonial government. Whiteley nicely sums up the problem:

In 1961 a Private Member's motion was tabled in the Ghana National Assembly to the effect that "... in the opinion of this House it is desirable that the Akan language should be taught in all schools in Ghana." . . . The motion was defeated, but during the debate many points were raised which have appeared again and again . . whenever language matters are discussed. A majority were in favor of retaining English as the official language not only because of its international status, but also because of its unifying role within Ghana. Yet, even among those who supported its retention it was recognized that original contributions in, say, literature, might not be forthcoming so readily in English. . . . The Deputy Minister of Education, Mrs. Susannah Al-Hassan is reported to have summarized official policy in the following terms: ". . . it is the intention of Government to encourage the development of all our major national languages so that each of them may have an equal opportunity of attaining a standard which would improve its chances of being chosen as the national language when the time comes for such a decision. . . . In the meantime, I think honourable members will agree that we have enough on our plate to keep us busy for a few more years, without having to worry about a common language." (1971, 552-53).

Governments changed repeatedly over the next generation, but the language policy of Al-Hassan remained untouched. The staff at the Bureau of Ghana Languages in Accra has analyzed and developed a number of indigenous languages, but their books are usually neglected by school authorities, who often refuse to purchase or to assign them (*People's Daily Graphic* 1990).

In the early 1990s there was some movement on the official language front. Jerry Rawlings, Ghana's leader, inadvertently reactivated the language issue. In an attempt to reduce the power of Ghana's regions, Rawlings enhanced the powers of the districts and increased their number from 65 to 110. As a consequence of this change, nearly all districts are now linguistically homogeneous. In the first elections for district assemblies, candidates who had no facility in English were permitted to run. Political debate in the assemblies, especially in rural districts, began to take place in indigenous languages. Debates have been lively and participation active. This is the most important official use of indigenous languages in modern Ghana even if English remains the sole official language of law and administration.5

The vibrancy of political discourse relying on indigenous languages in the district assemblies reflects the sociolinguistic reality in which the indigenous languages of Ghana are used in many walks of life. Even in the schools, the indigenous languages have a semiofficial role. In a 1991 survey of Cape Coast, where English is extremely prestigious and widely used, Fanti remains a language of considerable importance in many social domains.6 To be sure, English was the official medium of instruction throughout primary, junior secondary, and senior secondary schools; yet in 95% of the primary schools surveyed, teachers reported using Fanti as a medium of instruction instead of English, at least some of the time. Most teachers reported that the children who begin school cannot understand basic directions or concepts in English. At junior secondary school, a few teachers report using Fanti to explain concepts, but English becomes the language of instruction and continues that way up through the grades. English dominates recreational reading at all levels largely because the only available works in Fanti are specialized language and literature texts.

But Fanti does not progressively get eliminated from the lives of advanced students. Through secondary school, Fanti predominates over English on the soccer fields and in informal singing. Furthermore, Fanti is a required subject for students all through their school careers. And teachers report almost unanimously that non-Fanti students have little trouble in learning Fanti. In our survey, no teacher reported any resistance of non-Fanti students in learning Fanti, and many reported that non-Fanti students often did better in the Fanti examinations than the Fanti students. Fanti remains the language of informal domains. Speaking English in those domains is considered overly formal and distant.

Pidgin has specialized functions in Cape Coast

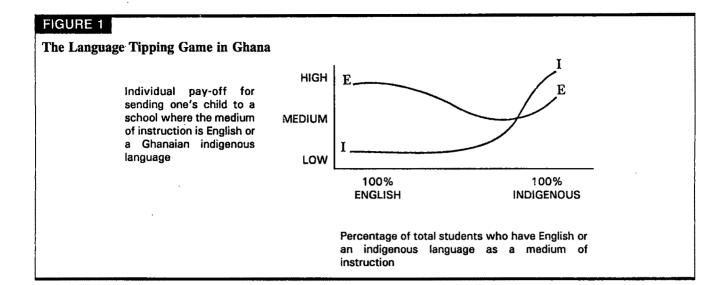

schools—to tell off-color jokes or to relate incidents in highly informal settings that are especially amusing.⁷ But teachers are so emphatic that they never-and their students rarely—use pidgin that one suspects otherwise. Many teachers put exclamation points after the no in answer to our question as to whether they use pidgin in the staff room. One teacher wrote that pidgin "is used by students when they want to express themselves without others understanding them." This comment reveals more about the teacher's values than it does about the use of pidgin. The project supervisor, however, observed interactions in these schools and claimed that there was no underreporting of pidgin. Results from a wider survey (to be described shortly) come to a similar result. When asked what they would do if a young person addressed them in pidgin, only 15% of our respondents said they would answer in pidgin. On the question of whether Ghanaian writing should rely on the Queen's English, a large number of respondents felt it important to keep to the international standard. "If we are learning someone's language," one respondent offered, "then it is better we learn it in its original form so that he will not have any advantage over us" (K11).8

If pidgin remains limited in use and low in prestige in Ghana today, there is a speech form that relies heavily on Akan-English code switching, and this form is evidently used far more widely than even its speakers recognize. In interviews, a number of speakers denied relying on it while using it extensively in those very interviews. The speech form plays an important role in interethnic communication and has no overtones of belonging to a particular group, despite its extensive reliance on Akan languages. Furthermore, linguistic analysis of this speech form suggests its emergence as a natural language (Forson 1979). I shall refer to this emergent language as Ghanaian. In contemporary Ghana, Ghanaian has a role not unlike that of "English" during the period of Falstaff and Prince Hal: it is a widely spoken language of popular culture whose speakers do not consider it a "real" language.

In contemporary Ghana, African languages remain in limbo. English is clearly the language of expertise, of central administration, of international business. Yet the African languages remain vibrant in many social domains, and since there are virtually no monolingual Ghanaians in English, there are no discernible trends pointing to the death of African languages. Nationalism seems strong because Ghanaians retain their ancestral languages with low economic pay-offs for doing so; yet it seems weak because Ghanaians put up little resistance to the everwider use of English in public life.

LANGUAGE COORDINATION AND THE TIPPING GAME

The "story" that motivates my theoretical models is as follows. Most Ghanaian citizens are convinced that

it is necessary to learn English to get a well-paid job in the modern sector and surmise from this that it is unrealistic to educate their children through the medium of an indigenous language. But most Ghanaians have inchoate feelings that continued reliance on English is tearing them from their own cultural roots. This reliance is seen as a remnant of colonialism. In terms of linguistic policy, Ghanaians are pulled in opposite directions.

This ambivalence can be portrayed graphically (see Figure 1) as a *tipping game* (Schelling 1978, chap. 7). The Babelian tipping game has six characteristics. First, the binary choice is for parents to enroll their children in English medium schools (where indigenous languages become restricted for family domains) or to seek out schools where a Ghanaian language is the medium of instruction (and where English or other international languages are taught only as subjects).

Second, virtually all schools in Ghana rely on English as the medium of instruction, and all jobs in the modern sector require a good working knowledge of English. The payoffs for educating your child in English when 100% of official business is conducted in English are far higher than the payoffs for educating your child in an indigenous language. This represents the present equilibrium.

Third, the game is one of coordination, not pure conflict. Each Ghanaian parent wants her children to be educated in the common language of official business and elite discourse. An outcome in which Ghanaians used languages that were not easily understood by large numbers of fellow Ghanaians for correspondence, petitions, and television programs would bring substantial disutility to all. (But at 100%-English, any mover to the indigenous language would suffer great losses, while the loss for n-1 Ghanaians would be small.)

Fourth, figure 1 indicates that if there were coordination in an indigenous language (i.e., 0% of official business conducted in English), the individual payoff for having been educated in that indigenous lan-

guage would be higher than the payoff for having learned English when 100% of official business is conducted in English. (This assumption will be given a plausibility test in the empirical data to be presented shortly.)

Fifth, calculating the value to an individual at 100%-indigenous is complicated by the fact that individuals do not know which indigenous language would be official. To calculate their value for education in an indigenous language, then, individuals must rely on calculations of expected utility. Suppose we were to ask an individual i about personal utility for an outcome that is at 100%-indigenous in a country with k languages. Individual i would sum the probability of each language in set k being designated as the official language multiplied by personal utility for that language at 100%-indigenous. Her calculation would be: 11

$$EU_i = \sum_{\forall k} P_k U_{ik}$$

Since the expected utility of individuals from different language groups differs, line *I-I* on Figure 1 represents the average payoff for all citizens, whose individual payoffs may diverge considerably from the mean. (The wide divergence, based on the different utilities for speakers of different languages, makes the Ghana case different from representations of regional revival movements—in Quebec, Flanders, and Catalonia for example—where there has been agreement about the language that would replace the status quo.)

Sixth, this tipping model captures two coordination problems. First, we have a game of pure coordination. We see that 100%-indigenous may be the Pareto superior equilibrium (i.e., at least as good as the other equilibrium for all and better than the other for at least one), but it would be irrational for anyone to move unilaterally from the status quo. This is because the status quo is a Nash equilibrium, which means

that no player has an incentive to leave unless coordinated with other players.

The second coordination problem resembles the game battle of the sexes. (In this game, both members of a couple prefer to be together but differ as to where it should be. Each would rather prevail but both would rather coordinate than separate. The problem is where to go.) The coordination problem here is in the specification of the indigenous language to be chosen as the official language of state business. Many Ghanaians would prefer to rely on a common indigenous national language but differ as to which it should be. Each would rather prevail, but many would rather coordinate on choosing an indigenous language than separate themselves from their cultural roots by relying forever on English as Ghana's official language.

EMPIRICAL EVIDENCE

The intuition behind this theoretical analysis is that there may be a Pareto efficient language policy in Ghana that has not yet been properly identified. But how are we to know whether an alternative dominates the status quo without knowing the subjective preferences of Ghanaians themselves? How are we to be sure that basic assumptions about language choice, embedded in the models, reflect social reality?

With these questions in mind, Edward Mensah and I drafted a survey and collected 39 responses from Ghanaians living in the Chicago area. The results were encouraging for the assumptions behind our models, and we reported them (Laitin and Mensah 1991). We redesigned the survey instrument and pretested it in Ghana in October 1990 while training graduate students to administer it. In December 1990, a revised interview schedule was administered to 300 respondents in six distinct regions of the country, so that we have interviews with 50 respondents each from the Dagbani, Ewe, Fanti, Ga, Kasem, and Twi language zones.

Interviewers (1) were indigenous to the area in which the interviewing was done, (2) introduced themselves alternately in the local language and in English and then asked the respondent which language he or she would prefer for the administration of the interview, (3) were given targets for people in certain social roles but without other provisions for representativeness, and (4) were encouraged—indeed, rewarded—for writing down in a separate book any side comments and criticisms that respondents offered during the interview.

The survey results give us a handle on some important issues in the political resolution of language coordination problems. I shall examine the assumption that the expected value of 100%-indigenous is higher than 100%-English and address the issue of side payments, a mechanism crucial for coordination games in general but apparently out of place in the realm of language choice.

Constitution of the Tipping Game

Establishing an individual payoff at 100%-indigenous that is higher than at 100%-English raises the thorny issue of calculating costs and benefits not only for learning a language, but in the sense of resentment that a majority of Ghanaians whose language is not chosen—and pride that the minority whose language is chosen-will feel if any indigenous language is chosen as Ghana's official language. The sense of pride in having an indigenous language as Ghana's official language must be weighed against the costs of developing sufficient teaching materials in a language that remains marginalized from international science and technology. And then there is the problem of administrative cost. The acceptance of English did not involve up-front costs for newly independent states. Meanwhile, the creation of mechanisms for reallocating costs in the imposition of an indigenous language is itself costly and should work to reduce the overall value of 100%-indigenous. For purposes of this preliminary discussion, the payoffs for a language choice are based only on the subjective assessment of the individual (or family) economic returns for having developed facility in a language and of psychological returns for having an official language that enhances social (or national) solidarity.

Respondents were invited to make these subjective calculations. Indirectly, a case can be made that ceteris paribus, the respondents would prefer to live in a Ghana under conditions of 100%-indigenous. However, there is some direct evidence against my assumption: on the simple question whether respondents preferred English to become the dominant language for official communication in Ghana or a single Ghanaian language to replace English, 60% chose English, and 40% chose the Ghanaian alternative

The reasons for the preference for English need, however, to be analyzed. Some respondents who chose English pointed to the situation for small and relatively poor states in the international political economy. Citizens of those states must compete, respondents argued, for international jobs, and a solid education in English is an essential skill for successful penetration in the job market. As one respondent put it: "It would not have been any problem if Ghana were to have a vibrant economy that can take care of our needs. . . . The Japanese or Germans for instance don't need to learn someone else's language because you can grow and work in the economy of your country without having to travel elsewhere. What English does for instance is to offer us the opportunity to seek greener pastures elsewhere if it becomes necessary" (K16).

Other respondents who chose English articulated a belief that indigenous languages are best used for home life, to create solidarity, and to express emotions that simply cannot be done in a language that you cannot consider your own. For their sense of rootedness, they said, there need be only a few

domains in which one uses one's indigenous language. A considerable number of respondents who chose to be interviewed in the language of home use found themselves unable to carry forward with the interview in that language and began using English. The interviewer of the Ga respondents noted that one person who chose to be interviewed in Ga "slipped" into English, and then "the answers started coming out" (G4). One Kasem respondent switched to English when he found the interview process to be "book long" and therefore more appropriately done in English (K32). Yet despite this loss of control over one's mother tongue for extensive conversation about national political issues, respondents would never consider giving it up for family functions. 12 The perspective from the international job market (favoring English) complemented by a view of the proper language for private domains (favoring one's mother tongue) would put a low value on the successful imposition of an indigenous language as the official language of Ghana.

But most of those who chose English as better than an indigenous language as the sole official language for Ghana did so because of practical problems in reaching a new equilibrium, not necessarily because the new equilibrium would be deficient. Many expressed the belief that no Ghanaian language is sufficiently "developed" in technical vocabulary or in scientific precision to play an important role in official communication. Others felt that although it would be good in the abstract, any language chosen would give its members too much "pride," which would be destructive to peaceful intergroup relations. The practical problems of implementation were so impressive as to color people's assessments of the payoffs should it be accomplished. As one respondent put it, "Even Kwame Nkrumah tried and it did not work so I do not think a single Ghanaian language can replace English as a dominant language for official communication" (G11).

Furthermore, the positive abstract support for a single indigenous language comes through clearly in the interviews. One respondent, before recounting the difficulties, said that "if there were a single Ghanaian as an official language its usage will have been ideal" (F23). Another pointed out: "One official language will identify us as a state. We have adopted English which has suppressed us" (G14).

Based on these data, I cannot provide an empirically justified expected value of 100%-indigenous and compare it with 100%-English, especially if values other than income are reckoned, such as pride and dignity and the chance to be citizens in a more powerful and coherent state. But I think it reasonable, given the reasons that respondents gave in their justifications for the choice of English as the sole official language of Ghana, to interpret these interviews as saying that transition costs aside, Ghanaians would prefer to live in a world of 100%-indigenous over 100%-English.

Will Side Payments Provide Incentives for Language Shift?

The usual way, theoretically, to induce movement from the status quo in an n-person tipping game is to provide selective incentives or side payments for particular individuals to change their language behavior (before the tipping point is reached) even though the average payoff for those who change will be lower than the average payoff for those who remain with the status quo. 13 Side payments involve compensating speakers of the nonchosen languages for their learning costs. Pool (1991) has demonstrated the theoretic possibility of accurately assessing costs (of learning and translation) so that the transition burdens can be made equitable. But he has not demonstrated that the costs of learning a new language and the costs of translation are the most salient costs in actual political cases. The psychological costs of personal complicity in the death of one's own language may be a principal concern of citizens.

The assessment of costs and benefits, our survey shows, takes place after the issue has been framed. Language shift can be framed as an efficiency measure or as a symptom of cultural death. Our data suggest that the big hurdle in implementing a policy through side payments has more to do with these "framing effects" than it does with getting the learning and translation costs right (Goffman 1974; Tversky and Kahneman 1986).¹⁴

In some frames, costs do not seem to matter. The costliest solution in Pool's analysis for "losers" is for them to learn the newly chosen language without compensation from either the winners or the state. Yet respondents had little trouble accepting as normal the costs when they were framed in a diffuse way. We asked: "If Ghana were to choose a single African language as the standard language for all official, educational matters and it was one from a region different from yours, would you (a) Seek to learn that language quickly to enable you to understand official speech? (b) Organize to get for your own language equal recognition? (c) Other (please specify)?" On this question, 226 out of 294 respondents (77%) said they would seek to 'learn' the language. Put this way, respondents make the arbitrary choice of an indigenous language as official look like a good (and cheap, for the state) idea.

Side payments suggest a different frame. When we proposed them, respondents were less positive about accepting the idea of the imposition of an indigenous language foreign to them as Ghana's official language than when we asked if they would learn or organize. We asked a series of questions as to whether they would be willing to accept a Ghanaian language other than their own as the medium of instruction in their children's school if the students were given job guarantees by the state for having made the language sacrifice. Only 26% of the respondents were willing to take any side payment offered; 31% were willing to take side payments only when considered useful; and 43% were adamantly unwilling. 15

627

Many respondents could not take the job promises seriously. Either they had no trust that their government would fulfill such promises, or they calculated that the expected value of a government job (without knowing English well) was far less than the value of English literacy with the enhanced value of international migration. One respondent said, "If the child has no English he would be permanently handicapped in his search for a job particularly in the international labour market" (K21). A woman who spoke no English and was willing to accept tax transfers that virtually no other respondents could abide answered no to the job incentive: "To get a 'white man's' job to do, you must speak and write English and since that is what we all want our children to do, I will like him to study English well" (K43). Some respondents clearly saw that the international labor market offered better prospects than did the Ghanaian government, whose promises few respondents would take seriously. One interviewee responded to the job incentive by saying: "Your questions are funny. If he learns no Akan and the government does not give him a job, he will farm" (D2).

If job incentives had some takers, our proposal that tax transfers be used to compensate losers had virtually no takers at all. In these questions, we mentioned specific languages (Akan, Hausa, and Ewe) as chosen languages. Some respondents said no on expected value calculations. For example, a respondent from outside the Akan-speaking zone mentioned Akan earlier in the interview as the obvious choice for a national language. Yet he rejected the job offer for his children if they were to study in the Akan medium "because . . . the money involved in learning Akan will be greater than the tax payment" (K50). In a similar vein, another respondent claimed, "I will prefer paying the tax to learning any other language as it is more expensive to learn language" (G3).

Most respondents did not perceive this question in terms of utility but, rather, in terms of morality. They saw these questions in the frame of a nefarious bribe and refused even to calculate: "This is pure bribery, it can never work, not here alone, all over the country" (E25). Many respondents, after hearing this offer, excoriated the interviewer for even posing the question-or for working for a biased scientist or for supporting an underground project to impose a foreign culture on them: "Is the fellow who designed the questions an Akan? He is biased" (D12). Chauvinistic comments about the respondents' own languages were brought to the fore: "We can't allow our language to die; it will mean the death of our very essence" (K48); "To neglect my language for another person's language, over my dead body" (F8); "I don't want my language Fanti to die a natural death and lose my cultural identity" (F7). Complementing the chauvinism and showing a reversal of the easy toleration most respondents demonstrated when they agreed to learn the language of the chosen language on their own, some respondents showed a disdain for the mentioned languages:16 "Why do you force Akan on us. This is annoying" (D9); "I know they

want us to accept Akan. But let me tell you this is a dream. It is going to bring war if the government should force Akan on the people" (D14); "Even if they force Akan on us, we will not learn" (D28); "Akan is a thing I detest. I prefer English" (G40). When non-Ewes were questioned about Ewe, the reverse feelings were expressed. One Twi respondent argued that Ewe should not have been mentioned at all: "No Akans feel good about it" (T20). A Kasem respondent rejected the tax proposal for learning Ewe: "Ewe is not known here; what is more, the Ewe people are not liked by most tribes in Ghana" (K13). In sum, the frame that the tax question put around the language picture is graphically exemplified by a Ga respondent who pleaded, "I cannot sell my birthright" and then criticized the interviewer: "You just can't kill one language and use it as a manure for another" (G14).

Much more work in analyzing our present data and collecting new data will be necessary to understand how language incentives can be successfully framed. Our interview schedule did not allow us, for example, to distinguish whether it was the idea of a tax or the mention of a specific language that evoked strong emotional outbursts. None the less, the interviews demonstrate that people indeed make expected value assessments in regard to language but that framing effects are powerful. We have seen that people are more amenable to diffuse than to specific commitments in regard to language investments. Further, we have seen that people have clear notions about inappropriate incentives for changes in their language repertoires that are not guided by issues of price. Incentive schemes for language change that do not factor in these framing effects are likely to trigger popular responses that will appear irrational to policymakers.

CAN THE 100%-ENGLISH EQUILIBRIUM BE UNDERMINED?

The Market Place of Languages Without Direct Political Interference

The present equilibrium based on the Schelling diagram approaches 100%-English, where all the official government documents, schools, and big businesses operate in English. This, of course, is a rather stylized view of the language repertoires that individual Ghanaians must master if they are to negotiate their ways through job, family, and the marketplace. As we saw, vernaculars and code-switching speech forms make for a complex language scene. And despite the equilibrium at 100%-English, virtually no Ghanaians living in Ghana have brought up children who are ignorant of at least one Ghanaian vernacular. The costs of maintaining the vernaculars (at least as languages for family and personal matters), are low; and the risks of abandoning them, given the possibility that order could break down in the cities and the people go back into ancestral villages for protection, fairly high.

From the point of view of transaction cost analysis, this solution to the Tower of Babel curse does not look too bad. Ghanaians must know two languages (English and their own vernaculars) in order to communicate with most local residents and all formally educated citizens in the country. But English also gives them access to virtually all important international communication networks, so English helps kill two birds with one stone.

From the point of view of the creation of a national culture, however, this solution has a serious deficiency. Since language is often considered an essential element of a national culture, reliance on English for intracountry communication gives Ghanaians the sense that while other countries (Sweden, Netherlands, Spain, etc.) have national cultures, they lack one. An internal (to the state) solution to the inefficiencies of a multilingual society would, in the eyes of many articulate nationalists, be preferable to the status quo.

Work on the optimum size of firms suggests there may be an economic as well as a cultural logic supporting the investment in indigenous national languages (Williamson 1986). First, organizational decentralization permits greater levels of experimentation and competition. And a world of languagespecific countries allows for a greater degree of decentralized decision making than would be the case if international transaction costs were equal to intranational transactions costs. Second, for a country making an investment in national education, languagespecific curricula lower the probability of "brain drain," as it encourages highly trained personnel to stay in their country to work, so that their children can get a firm grounding in the parents' language. Third, a reputation for having a legitimate national culture with a loyal workforce is also useful in attracting international investment. 17 To be sure, there are other ways than language specialization to establish a loyal "brand-name" national culture (Switzerland and the United States have succeeded here), but language specialization is an extremely powerful method to differentiate a national population from foreigners.

The Lottery: A Standard Microeconomic Solution to Coordination Dilemmas

However rational for the country, coordinating on an indigenous official language is irrational for the individual. First, as the tipping model suggests, it is irrational for any Ghanaian parent to seek education for a child in an indigenous language unless a great majority of other parents already had done so. A second reason is that even if the government did choose an indigenous official language, speakers of the nonchosen languages would have a dominant strategy to subvert the policy, and speakers of the

TABLE 1

The Akan-Dagbani Coordination Game with Akan as the Chosen National Language

DAGBANI PARENT'S CHOICE AS MEDIUM OF INSTRUCTION	AKAN PARENT'S CHOICE AS MEDIUM OF INSTRUCTION FOR CHILD			
FOR CHILD	ENGLISH	AKAN		
English Akan	5, 5 1, 4	4, 2 3, 8		

chosen language, knowing this fact, would follow suit. Table 1 illustrates why this is the case.

Table 1 (simplifying the situation by assuming only two competing indigenous languages) portrays the strategic situation for an Akan and a Dagbani parent in the face of an announcement of a standardized Akan as Ghana's official language and the medium of instruction in all public schools. This program presents a dilemma for Ghanaians. Should they enroll their children in government schools or pay a higher tuition and enroll their children in one of the private, English-medium schools that begin to appear in every town? How should they calculate their payoffs for each choice? If all send their children to the government schools, the route toward cultural independence will have been paved. But if all send their children to English-medium private schools, the government program (however popular in the abstract) would be subverted. But if any parent sends children to the government school while most others send their children to private school, that parent will have lost the game of coordination.

For Table 1, let us assume a utility of 5 if both send their children to a private, English-medium school. If they do not coordinate, the one who learns English gets a 4, while the one who gets educated in one's own indigenous language gets a 2, and the one who learns in a foreign indigenous language gets a 1. With Akan being the chosen language, we give an 8 for the Akan in the "Akan-Akan" cell. Let us say that for the Dagbani parent, education in Akan, under conditions of coordination, would yield 3, which is higher than noncoordination but lower than coordination in English. Under these circumstances the Dagbani player would have a dominant strategy to choose English, and the Akan player would rationally follow and choose English. The unique equilibrium is therefore "English × English." Given this situation, it would be impossible for a government to get noncoerced compliance for the promotion of any indigenous official language.

For coordination problems of this sort, game theorists have devised lotteries. For example, in the battle of the sexes, each player would prefer a coordinated coin flip to avoid the possibility of an uncoordinated outcome. Because game theorists rely on lotteries to solve coordination dilemmas, it is useful to think how such a device would work to solve the Tower of Babel

TABLE 2 The Akan-Dagbani Coordination Game under Conditions of a Lottery for National Language Choice

DAGBANI PARENT'S RESPONSE TO LANGUAGE LOTTERY	AKAN PARENT'S RESPONSE TO LANGUAGE LOTTERY			
	REJECT	ACCEPT		
Reject	5, 5	5, 5		
Accept	5, 5	(1 - p)y + p3, px + (1 - p)3		

Note: p = probability of Akan's winning lottery; 1 - p = probability of Dagbani's winning the lottery; x = utility to Akan speakers if Akan won the lottery; y = utility to Dagbani speakers if Dagbani won the lottery.

curse. Consider Table 2, where the Dagbani and the Akan parent are each asked to enter a language lottery in which a single Ghanaian language would be chosen as official. (In this case, the government would put chits into an urn, each labeled with a language, in proportion to the percentage of the population, and then choose a chit blindfolded.) Players can either accept or reject the lottery. If either rejects, the status quo of all-English is retained, in which case each player receives a score of 5.

The probability (p) that Akan will be chosen, given the higher percentage of Akan speakers, is greater than the probability (1 - p) that Dagbani will be chosen. However, the utility if Dagbani is chosen for a Dagbani (y), given the low percentage of Dagbani native speakers and the large employment opportunities available for those who have facility in the official language of state, is greater than the utility for an Akan (x) if Akan is the lottery winner. Assume a score of 3 for the lottery loser, which is lower than coordination in English, but higher than a failure at coordination. The expected utility for an Akan for playing the lottery is px + (1 - p)3. The expected utility for a Dagbani for playing the lottery is (1 - p)y+ p3. The lottery would be a rational outcome if both expressions yielded payoffs greater than 5. (If p = .7, x = 6, and y = 10, for example, players should rationally enter the lottery.)¹⁸

The problem with this lottery solution is that it assumes lottery players will respect its results. But how can either player credibly commit to accepting the lottery outcome? Why should any player believe that the loser would not subvert the lottery outcome after its announcement? Even if parents committed their children to matriculation in a government school as a precondition for playing the lottery, these parents could send future children to English language schools and subvert the lottery outcome in the long run. While the lottery principle is useful to unhook us from seeing the status quo as inevitable, it does not provide a compelling answer to the problem of coordination on an indigenous language in multilingual countries.

The 3 ± 1 Language Repertoire as a Politically Induced Equilibrium

Perhaps the dream of indigenous language promotion is quixotic? The logic of the tipping game, the probable backfire of economic incentives aimed to induce language shift, and the difficulty of assuring commitments in a language lottery all suggest the power of the status quo. Ghanaians, it seems, will continue to rely upon English for administrative, technical, and international communication, while using their vernacular languages for communication in informal domains with other Ghanaians who share that language.

Yet the models so far presented all assumed that there was a binary choice between English and some indigenous language. None of the models examined the strategic possibilities of multilingualism. For most of Africa, unlike America, multilingualism is the norm (Kashoki 1977). The de facto solution to the Tower of Babel curse has been the investment in multilingual repertoires. The final question that I shall address is whether a Ghanaian government could, in the context of a multilingual policy, promote a single indigenous language as official. 19

Indeed, respondents favored a multilingual context and were receptive to policies that promoted different languages in different domains of use. To be sure, they did not want a form of multilingualism where there would not be a common means of communication. When asked if they preferred for each group in Ghana to promote its own native language or whether Ghanaians should agree on a single Ghanaian language as the major language of official business, a majority (59% to 39%) chose the latter. But vernacular development, along with English as a lingua franca, was highly favored. When asked whether they preferred for English to become the dominant language in all walks of life or for English and the indigenous languages to share importance, a significant majority (89% to 9%) chose the latter. These respondents had a clear notion of how language domains should be ordered. For district council political administration, 72% favored the vernaculars as the official medium, where only 28% chose English. For medium of instruction in primary school, however, 87% favored English, while 10% favored the vernacular. While the political yearning for a unique national language could not be realized in the framework of a one-language state, perhaps it could be realized within a multilingual framework?

In light of these preferences, a plausible multilingual model for Ghana is that of India (Laitin 1989). Throughout postcolonial India, English remains the principal language of education, business, and political administration. However, the all-union (i.e., federal) government promotes Hindi, and this language is important for interstate official communications and popular culture (films, music, television). The state governments each promote state languages, and these languages are media of instruction in primary education and are used extensively in state-level

administration. Citizens need to know English, their state language, and Hindi to move in a variety of social, political, cultural, and economic circles. Those whose states rely on Hindi need to learn only two languages; and those who speak protected minority languages within states that have a different language as official need to learn four. This outcome can thus be called a 3 ± 1 formula.

Ghana, as we have seen, does not have a language such as Hindi to serve as a credible national language. Countries such as Indonesia (with Bahasa) or Kenya (with Swahili) are more obviously able to follow the Indian model. Pidgin might serve that role for a number of West African states but not (due to its limited use and extremely low prestige) in Ghana. Ghanaian, however, if given recognition by linguists, authors, and national politicians, might play such a role.

If Ghanaian is not seen as threatening to any group—with district leaders getting rents from the promotion of the regional vernaculars (by appointing officials literate in the vernacular giving vernacular speakers chances to provide translation services, and by advertising tenders in that language) and parents getting education in English for their children at government schools—the seeds might get planted for an indigenous official language. If Ghanaian were recognized, in a context in which district languages had important roles and where English remained crucial in technical and administrative domains, the macro outcome would be called a 3 + 1 formula (not 3 ± 1 , since no district language would be Ghanaian). To be sure, there is now no literature, no texts, and no name for this language; Ghanaian could not be accepted as a substitute for English in a binary choice atmosphere. It would have to emerge out of a long succession of micro choices.

Ghanaian would displace neither English nor the district languages in the short term but would be an outlet for artists, novelists, television scriptwriters, and translators, all of whom could be subsidized for their literary production. If Ghanaian is really the language of the growing urban popular classes, its chances of evolving into a national symbol are greater. It would need its Dante, or Webster, or perhaps Shakespeare for ultimate legitimation; but the government could set the stage for the emergence of such a figure.²⁰

This 3 + 1 equilibrium would give all Ghanaians the ability to communicate efficiently (without translators) with each other, and Ghanaians would study English sufficiently in school so that they could communicate internationally as well. The education costs for this equilibrium would be higher than the equilibrium at 100%-English, but there would be gains in human dignity (people using their own language in high-status domains) and in the creation of a national culture, which Ghanaians say they want, even though coordination dilemmas have up until now forestalled any effort to envisage how that culture could be created.

The Electoral Basis for a 3 + 1 Outcome

The 3 + 1 outcome could not result from a free market of language investments, without government interference. Even if it could be demonstrated that it was a Pareto superior outcome to the status quo (something that has not been demonstrated here), there would still need to be a government with the will and motivation to act. What evidence is there that such political engineering is likely, given the high incentive for any government to avoid the risk of intergroup antagonism by keeping the language issue off the political agenda?

In fact, the data in our survey point to the risks of such a program rather than its likelihood. Even those respondents whose children were disadvantaged by the all-English curriculum (in that children whose parents already spoke English had an easier time learning in school) wanted English as the medium of instruction in their children's school. They were willing to allow their vernaculars to be used in private domains, so that the strong respondent support of English along with vernaculars over the sole use of English reflects a desire not for equality between languages but rather for the symbolic recognition of the vernaculars. And most people fear the consequences of the arbitrary choice of one vernacular as the sole official language of state. English plays a role in Ghana similar to that of foreign kings invited to rule over small European states in the nineteenth century: it assures neutrality.

Nonetheless, support for an indigenous national language is a natural element in a populist opposition program. Populism can exploit a general feeling throughout a population that the only people who are profiting from the government are the bureaucrats and executives in multinational corporations and international agencies, all of them distinguished by their excellent command of English. Under these conditions, a populist contender might find that a program of cultural nationalism can capture the imagination of disgruntled voters. The dominant message would be a return to cultural and linguistic roots of Ghana. To be sure, populism in Africa for the most part has been associated with the political movements that celebrate the separate identity of particular language groups. Would the politicization of language issues in Africa promote just this sort of populism where first provinces and then districts would seek national sovereignty, leading in the limit to the absurdity of each idiolect's having its own country? Maybe so. However, there may exist populist strategies supporting the promotion of indigenous languages that are not divisive.

Suppose a populist challenger wins a national election in part on a platform of cultural independence and the need for a Ghanaian national language. Ghanaians might well vote for such a program (just as many Americans supported prohibition) with the full intention of subverting it privately. Such subversion would assure an English-medium education for their own children while all other children are

receiving a curriculum with an indigenous language playing a central role. Their own children would then be well equipped to land the best white-collar jobs in Ghana. The cumulative effect of such reasoning—which might be called the private subversion of a public good—would be the failure of the national program.

To implement such a program without mass subversion, the populist leader would need to assure district leaders that their languages would not be undermined by the promotion of a single indigenous language and to assure parents that English would remain central to the curriculum. One possible plan would be for the new leader initially to introduce a curriculum in the state schools that included English and district vernaculars as dual media of instruction. Those parents (constituting 89% of our respondents) who preferred English along with the vernacular over English alone would not likely withdraw their children from state schools as long as English remained central to the curriculum. Furthermore, district leaders would be pleased to implement the program if only because the promotion of district vernaculars would give local leaders patronage power (e.g., in purchasing text books) and the ability to keep local administration in the hands of the people who speak the district vernacular.

Meanwhile, the national leader could begin supporting the development of pedagogical materials in a national language, let us say Ghanaian. (This includes more than textbook production. National programs to promote a literature in Ghanaian would need to be implemented, say, by subsidizing books and newspapers that use it.) After a period in which the vernaculars had been institutionalized in district schools and materials developed in Ghanaian, the leader would be in a position to introduce the proposed national language into the curriculum. District leaders, who may have fought such an introduction in schools that relied only on English and fought the simultaneous introduction of a national language and vernaculars in fear that the latter would dominate the former, would be less inclined to fight against the introduction of Ghanaian when the schools were already promoting district languages. Parents who feared the development of district languages without a national language (59% of our respondents) would find this development a healthy one, as long as English remained dominant as a medium of instruction. And since Ghanaian represents no particular subgroup in Ghana, the communal animosities that appeared when we asked respondents about Akan or Ewe as a national language would be side-stepped. Few parents would have an incentive to take their children out of the state school system.

The long-term result of this strategic introduction of languages into the national educational curriculum could be a universally understood indigenous Ghanaian national language, one that was introduced without coercion, without intercommunal conflict, and without mass subversion of public institutions.

Much of my thrust here has been to demonstrate

the difficulty of attaining what may be a Pareto superior outcome for countries such as Ghana, where there is a strong popular desire for the implementation of a national language but an inability to do so, in large part due to the difficulty of reaching a consensus as to which of many vernaculars could serve as a national language. Even if the national language does not (at first) have high status, part of the solution must be in the choice of a neutral national language, largely because the use of a lottery to choose an already-established vernacular as the national language will break down. As a populist leader develops a neutral language as the national language, that leader can strategically work for its acceptance. The political program I have illustrated shows that the inchoate desires of many Ghanaians for an indigenous national language are not hopeless.

CONCLUSION

The curse of the Tower of Babel afflicts African states in general, and Ghana in particular, with great force. I have sought to think systematically about a solution that improves upon the market-induced outcome, which, from the point of view of many Ghanaians, is inefficient. I have assumed (reasonably, as the surveys show) that Ghanaians themselves would prefer coordination on a language from within the country over one of a previous colonial regime. I have shown the underlying reasons why coordination is such a problem. By doing so, I was able to suggest alternative strategies for reaching a coordination point preferable to the one that the status quo now offers. This is the 3 + 1 language outcome, in which an indigenous national language gets promoted and institutionalized, along with district vernaculars—all in the context of continued reliance in many domains on the language of former colonial rule. This outcome would be favored over the status quo by many people in countries like Ghana, where there is societal multilingualism and a coordination problem for choosing a national language. I have provided a strategic analysis of how coordination problems can be overcome to attain a 3 + 1 outcome. However, I have not here offered a definitive solution to the curse of Babel but rather provide an analytical representation of the problem that makes it more susceptible to solution.

Notes

This paper was originally prepared for the annual meeting of the American Political Science Association, Washington, 1991. The Spencer Foundation financially supported the fieldwork for the empirical research reported herein. Edward Mensah is my collaborator in the larger project concerning language in Ghana, of which this paper is a part. The survey project in Ghana was managed by A. Afrifa and Pwasanga Ataogye, and their expertise in psychology added depth to our interviews. James Fearon provided invaluable technical and theoretical support. Ronald Rogowski and Duncan Snidal

commented usefully on earlier versions. Eric Budd and Stathis Kalyvas provided research assistance.

1. It is unfortunate for me that Brams did not consider the Tower of Babel in his stimulating *Biblical Games* (1980). On issues of coordinating on an official language, Pool's models (1991) have been pioneering.

A lingua franca is a language of a certain group appropriated for intergroup communication. A pidgin is a mixed language that is not native to any group and is not passed on

intergenerationally as a first language.

- 3. Transaction cost concerns not only help us interpret the behavior of state rulers but also help explain language investments of individuals. In situations where there are pockets of monolingualism in a language different from the language of rule, certain individuals, by investing in an expanded language repertoire, have reduced transaction costs for their own affairs and have taken advantage of transactions barriers that others face by providing useful translation services (De Swaan 1988).
- 4. For the reasons why twentieth-century state building provides greater difficulties for rationalization, see Laitin 1992, 38–45. For the set of multilingual African countries without a common indigenous lingua franca, see Laitin 1992, 121–32.

5. Interview conducted by David Laitin with Kwamena Ahwoi, Provisional National Defense Council secretary for

local government, Accra, 29 October 1990.

- 6. For purposes of this study, I commissioned K. K. A. Anti to undertake a survey of 22 schools at all levels in Cape Coast, a city that often prides itself on having the most modern educational system in Ghana and one that they feel should serve as a model for all of Ghana. The wide variety of elite Ghanaians who send their children to boarding school there attests to the national acceptance of their claims.
- 7. Pidgin in West Africa is heavily influenced by English, but relies on indigenous language structures and vocabulary as well. It is socially perceived as an indigenous speech form.
- 8. Respondent numbers are indicated in parenthesis. The letter refers to the initial of the sample group's vernacular, to be identified later on in the text.
- 9. Code switching, according to Haugen is "the alternate use of two languages, including everything from the introduction of a single, unassimilated word up to a complete sentence or more into the context of another language" (1978, 21).
- 10. Schelling's style is to present interesting-looking payoff curves and then match the pictures with actual situations, even if "there is no guarantee that a pair of real choices exists somewhere that corresponds to some pair of curves that we might adopt on heuristic or architectural grounds" (1978, 219, 234). My approach is to draw the payoff curves consistent with my sense of the subjective utility of actors in a specific situation, even if the curves lack Schelling's cleanness. Two aspects of the curves in Figure 1 have interesting features: (1) the tipping point k is closer to 100%I than 100%E; and (2) in the movement toward the 100%I equilibrium, the declining marginal return for English bottoms out, and the value of E begins to rise as the society moves toward 100%I. Neither directly affects my argument here; I include these features in the figure as a reminder that the game is more complex than what can be portrayed here.
- 11. That is, the expected utility for speaker i is the sum for all members of k of the utility of each language if it were chosen as official multiplied by the probability of its being chosen. For Figure 1 to be empirically based, we would need data on expected utilities for all individuals at each point on the horizontal axis.
- 12. Dorian (1981) has developed a "tipping model" showing how as the number of domains (e.g., work, family, recreational reading, poetry) in which a language is used decreases, a dynamic leading to "language death" will likely be set in motion. Among the Ghanaian respondents to the survey recounted here, the tenacity concerning one's indigenous language (especially in the domains of family and community life) makes the "tip" toward death highly un-

likely. More than feelings of local pride are at stake. Spouse selection, ability to cement support networks in cosmopolitan centers, and the opportunity to get a chief's title in one's hometown are all in part contingent on maintaining facility in one's home language. The observation that local languages and dialects can serve well-demarcated needs over generations, without facing death, has been made by Fernandez (1986).

13. Another theoretical tack is to introduce sequencing, building on the assumption that certain individuals have higher-than-average payoff for I or lower-than-average payoff for E at some point to the left of E. Any individual who, by virtue of "switching," pushes the game closer to E could "trigger" the move of a second individual, whose payoff for E now is higher than that for E. A version of a sequencing model will be presented in the final section.

14. I use the word framing somewhat more broadly than do Tversky and Kahneman: They require that the alternatives have the same expected utility. Some of the respondents in the survey reconfigured the utility for certain options based on factors external to the situation presented to them. For this reason, my use of the frame concept is closer to Goffman's

than to Tversky and Kahneman's.

- 15. I do not here address the issue that while side payments may equalize costs, the provision of government sinecures as a side payment may have the effect of reducing significantly the gross national product and thereby reducing the average payoff for 100% I. Nor do I address the issue of the administration of side payments that may take on characteristics of welfare bureaucracies and thereby enrage the population. The specter of bureaucratic-linguistic tyranny could raise the subjective utility of the status quo at 100% E.
- 16. Rarely did these emotions surface until interviewers got to the question, at the end of the interview, about the tax proposal. But one exception was a Dagbani respondent who, in response to the question asking for a suggestion as to which language might serve as an indigenous national language, responded in anger. "For a long time now, the Akans think that we northerners are less human. If we adopt their language, our position is going to worsen" (D30).

17. This notion is by analogy from David Kreps's (1990) arguments providing a rationale for the investment in distinct

corporate cultures.

18. If utility is modeled as a linear function of group size, it would be possible to predict whether any group would rationally enter the lottery. The slope of the function would determine whether the risk were superior to the status quo for each group. Some functions would favor groups on the extremes (very large and small populations); other would favor groups that had population percentages closer to the median group.

19. In Laitin 1992, the model that follows is formalized and applied to a large set of postcolonial states.

20. Weinstein (1979) refers to such types as "language strategists."

CIVIC CULTURE AND DEMOCRACY: THE QUESTION OF CAUSAL RELATIONSHIPS

EDWARD N. MULLER University of Arizona MITCHELL A. SELIGSON University of Pittsburgh

causal model of relationships between structural properties of states, civic culture attitudes of the general public, and change in level of democracy is tested with cross-national data. The model permits inferences about the possibility of unidirectional or reciprocal causation between civic culture attitudes and democracy, controlling for macrosocietal variables such as economic development, income inequality, and subcultural pluralism. Most civic culture attitudes do not have any significant impact on change in democracy. One of them, interpersonal trust, appears clearly to be an effect rather than a cause of democracy. The exception is the percentage of the general public that prefers gradual reform of society instead of revolutionary change or intransigent defense of the status quo. Support for gradual reform has a positive impact on change in democracy, and it is unrelated to a country's years of continuous democracy—findings that support the hypothesis of a unidirectional civic culture effect on democracy.

n important unresolved question in the study of democratization is whether attitudes of the general public have a major causal effect on the establishment and stability of democratic regimes. The theory of civic culture proposed by Almond and Verba (1963) and further elaborated by Inglehart (1988, 1990) postulates that the viability of democratic institutions is affected powerfully by attitudes such as belief in one's ability to influence political decisions, feelings of positive affect for the political system, and the belief that other citizens are basically trustworthy. Countries with high levels of these civic culture attitudes are expected to be more likely to adopt and sustain democracy over time than countries with low levels, regardless of socioeconomic factors such as level of economic development. An alternative possibility is that civic culture attitudes are an effect rather than a cause of democracy. According to this line of argument, democracy typically is established for reasons other than civic culture attitudes of the general public, and the successful persistence of democracy over time is likely to cause increases in levels of civic culture attitudes because high levels of subjective political competence, pride in the political system, and interpersonal trust are a rational, learned response to the experience of living in a country that has a stable democratic regime (e.g., see Barry 1978, 50-52; Schmitter and Karl 1991, 82-83).

The hypothesis that democracy causes civic culture would seem a priori to be as plausible as the hypothesis that civic culture causes democracy. If so, causal models of the relationship between civic culture attitudes and democracy should be formulated to take into account the possibility of reciprocal causation between these variables. Until recently, it has been difficult to assess the relevance of attitudes of the general public for the establishment of stable democratic regimes because of lack of sufficient cross-

national data on attitudes. The pioneering study in this regard was conducted by Inglehart (1988, 1990), who was the first to compile data on attitudes of the general public for a sample of countries that was large enough to permit multivariate statistical analysis of the relative influence on democratization of micro political culture attitudes as compared with macro socioeconomic factors. Inglehart's causal model is grounded, however, in the assumption of unidirectional causation—that civic culture has an effect on democracy and that democracy does not have an effect on civic culture.

Inglehart's model consists of four variables: (1) a country's level of economic development in 1950, as measured by its gross national product (GNP) per capita; (2) the percentage of the labor force employed in the tertiary sector (no date given), which is interpreted as an indicator of the size of the middle class; (3) a composite measure of civic culture over 1981–86 that reflects an average for the general public of its level of life satisfaction, interpersonal trust, and lack of support for revolutionary change; and (4) a country's years of continuous democracy from 1900 to 1986. The model stipulates that economic development is a predetermined variable (which may have causal effects on the other three variables) and that the percentage of the labor force in service occupations (the tertiary sector) and the average level of civic culture are intervening or mediating variables, caused by variation in level of economic development, which, in turn, are causes of variation in a country's years of democracy. Estimates of the effects of the predetermined and intervening variables on democracy showed that economic development had no significant direct effect, that the labor force in services variable had a direct effect of +.36, and that the civic culture variable had a direct effect of +.74 (Inglehart 1990, 44). These results led Inglehart to

infer "that over half of the variance in the persistence of democratic institutions can be attributed to the effects of political culture alone" (p. 46). And he concluded more generally that this evidence "tends to confirm the basic thesis of *The Civic Culture*" (p. 48).

If Inglehart's causal inferences are valid, explanations of democratization that emphasize political culture attitudes must be given primacy over explanations that emphasize the importance of macro socioeconomic conditions. The problem is that the possibility of an effect of years of continuous democracy on civic culture attitudes is ignored. A proponent of the alternative hypothesis that democracy causes civic culture attitudes could reasonably argue that the supposed "effect" of civic culture on democracy is really an effect of democracy on civic culture. Indeed, because of the fact that a country's years of continuous democracy are calculated from 1900 up to the time of the measurement of the civic culture attitudes during 1981-86, this means that the temporal status of the years of continuous democracy variable is prior to the civic culture measurements. It would thus be more straightforward and plausible to interpret a strong association between civic culture 1981-86 and years of democracy 1900-1986 as reflecting the possibility of a strong causal effect of the persistence of democratic institutions on a country's level of civic culture.

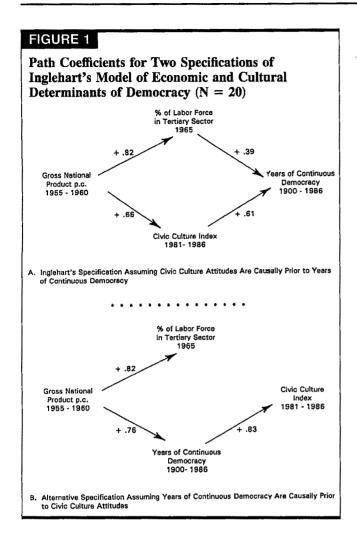

A second problem with Inglehart's analysis involves the conceptualization of civic culture, defined operationally by a composite index of life satisfaction, interpersonal trust, and lack of support for revolutionary change. Since life satisfaction is not a component of the civic culture concept originally proposed by Almond and Verba and since Inglehart does not provide a theoretical justification for why life satisfaction should be assumed to be part of a unidimensional syndrome of civic culture attitudes, one could argue that life satisfaction should be analyzed separately from interpersonal trust and lack of support for revolutionary change. Moreover, since these latter variables also are conceptually distinct and cannot be assumed on definitional or empirical grounds to be unidimensional, it would be useful to analyze them separately, too. Therefore, the more appropriate measurement strategy would be to "unpack" the composite index of civic culture and test hypotheses using each of the attitudinal variables

A potential third problem is that Inglehart's model may be subject to specification error. Inglehart assumes that the percentage of the labor force in service occupations is the only relevant macrosocietal determinant of democracy apart from level of economic development. Given the fact that the *labor force in services* variable has never been included previously in cross-national macro research on determinants of democracy, this strong assumption seems dubious. Omitted variables for which a compelling case can be made theoretically, following the analysis of Dahl (1971), include income inequality and subcultural

pluralism. Empirically, research focusing specifically on the stability of democracy over time has found that the extent to which income is distributed unequally is an extremely powerful negative influence that mediates the positive effect of economic development (Muller 1988). And research on determinants of crossnational variation in level of democracy has found that subcultural pluralism is one of the relevant noneconomic influences (Bollen and Jackman 1985). Income inequality and subcultural pluralism may thus be relevant omitted causes that could affect the estimates of causal influence in Inglehart's model.

Although we are critical of Inglehart's model specification and measurement procedures, we share his concern with assessing the relevance of attitudes of the general public for the establishment of stable democratic regimes. The step that needs to be taken now is to formulate a research design that enables one to address more effectively the question whether unidirectional or reciprocal causal relationships may obtain cross-nationally between civic culture attitudes and democracy, controlling for the influence of macrosocietal determinants. We shall test an alternative causal model in which the dependent variable is change in a country's average level of democracy from the 1972–80 period to the 1981–90 period. If civic culture attitudes have significant effects on change in democracy, such that high levels of civic culture attitudes are associated with increases in democracy and low levels are associated with decreases in democracy, then at least the possibility of civic culture causing democracy will be supported. By contrast, if civic culture attitudes do not have significant effects on change in democracy, then one can be skeptical about claims that civic culture attitudes are an important cause either of transitions from authoritarian rule to democracy or of the persistence of democracy over time. The possibility of a causal effect of democracy on civic culture attitudes will be taken into account by including a country's long-term experience of democracy in the model as a predetermined variable that could have an influence on civic culture attitudes independent of other macro socioeconomic conditions.

We begin our analysis by testing for causal relationships between civic culture attitudes and democracy using Inglehart's sample of primarily European (or European-heritage) countries. Then we test an alternative causal model with an expansion of Inglehart's data set. We have collected measurements of system affect (as inferred from attitudes about societal change) and interpersonal trust (elements of civic culture common to the conceptualizations of both Almond and Verba and Inglehart) from representative surveys conducted during 1990-91 of urban populations in the six Central American states: Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua, and Panama (see Appendix B). These data are added to the measurements used by Inglehart from surveys conducted during 1981–86 (see Appendix A).

CAUSAL MODELS OF ECONOMIC AND CULTURAL DETERMINANTS OF DEMOCRATIZATION

Estimates of causal path coefficients for versions of Inglehart's model of economic and cultural determinants of democracy are shown in Figure 1. The measure of civic culture is a composite index of life satisfaction, interpersonal trust, and opposition to revolutionary change constructed for 20 countries with information on all three variables.2 The results obtained for model A closely reproduce those reported by Inglehart (1990, fig. 1-6).3 In this model, the index of civic culture measured with data from 1981 to 1986 is assumed to have a unidirectional effect on a country's years of continuous democracy since 1900. Given that assumption, the path coefficients indicate that civic culture attitudes are by far the most important determinant of years of continuous democracy, that the percentage of the labor force in service occupations (the tertiary sector) has a much smaller direct effect on years of continuous democracy, and that the influence of level of economic development is entirely mediated by civic culture and the percentage of the labor force in services.

Model B shows the results when the temporal

ordering of civic culture and years of democracy is corrected so that years of continuous democracy from 1900 to 1986 precedes civic culture attitudes observed for 1981 to 1986. This model shows strong support for the alternative hypothesis that the experience of stable democracy produces high levels of civic culture. When the civic culture index is regressed on years of continuous democracy, percentage of the labor force in services, and economic development, only years of continuous democracy has a statistically significant effect. 4 Moreover, when years of continuous democracy is regressed on labor force in services and economic development, only GNP per capita has a significant effect. Model B thus corresponds to a very different pattern of causal inference than model A. From his estimates for model A, Inglehart concluded that "economic development per se does not necessarily lead to democracy. Only insofar as it brings appropriate changes in social structure and political culture does it enhance the viability of democratic institutions" (1990, 44). By contrast, if one makes a single change in the causal ordering of the variables, a change that reflects more correctly the temporal ordering of the measurements, one then finds that economic development enhances the viability of democratic institutions directly and that social structure is irrelevant. Moreover, the effect of economic development on civic culture attitudes becomes indirect, transmitted through the influence of economic development on producing stable democracy.

As they stand, we believe that model B is more defensible than model A, but neither model addresses the possibility of a causal effect of civic culture on change in level of democracy—the question that is at the heart of the civic culture thesis. If civic culture attitudes of the general public are a relevant determinant of democratization, then high levels of civic culture should produce increases in a country's level of democracy and low levels of civic culture should inhibit the development of democracy. In other words, civic culture attitudes should have a positive effect on change in level of democracy over time.

Currently, the most widely used indicators of the extent to which a country's political system is democratic or repressive are the ratings of political rights and civil liberties on seven-point scales developed by Raymond D. Gastil for Freedom House and reported annually since 1972. The political rights and civil liberties scales are based on check-lists that cover 11 and 14 different criteria, respectively (see Gastil 1991); and they appear to have good reliability as suggested by very high correlations between them and other conceptually similar measures available for particular years only (cf. Bollen 1986, 588; Banks 1986; Coppedge and Reinicke 1991). We use the average political rights and civil liberties ranking, converted to a scale of 0-100, as an index of a country's level of democracy in a given year and then compute a mean level of democracy score over two intervals, 1972–80 and 1981-90 (see Appendix A).

The regression equations reported in Table 1 test for the possibility of an effect of civic culture attitudes

on change in democracy from the 1972–80 interval to the 1981–90 interval. The dependent variable is a country's mean annual level of democracy during 1981–90; and since a country's mean annual level of democracy during 1972–80 is included in the equation, the effects of the civic culture variables are effects on change in democracy, that is, the level of current democracy *independent* of its previous level.

The equations in the upper panel of Table 1 test for

effects on change in democracy of the composite civic culture index and each of its components analyzed separately.⁶ Equation 1.1 shows that the composite index of civic culture has no significant effect on change in level of democracy. (Indeed, the coefficient on the composite index is smaller than its standard error.) Thus, if one uses only the composite index of civic culture, the causal inference of model B is supported: democracy has a strong positive effect on

^a South Africa excluded.

^b Mean of life satisfaction, interpersonal trust, and opposition to revolutionary change.

^c Norway excluded. *p ≤ .05, one-tailed.

the development of civic culture attitudes and civic culture attitudes have no effect on democracy.

When the civic culture index is unpacked, however, one finds that the components have different effects on change in democracy. Equation 1.2 shows that life satisfaction, which is conceptually distinct from Almond and Verba's notion of civic culture, has a negative effect on change in democracy. But the coefficient on life satisfaction is not sufficiently larger than its standard error to be statistically significant at the .05 level for a two-tailed test (or a for a one-tailed test), so we cannot reject the null hypothesis of no effect. Equation 1.3 shows that interpersonal trust has no significant effect on change in democracy. By contrast, Equation 1.4 shows that the percentage of the general public in favor of revolutionary change does have a significant negative effect (the expected direction) on change in democracy.

Inspection of the distribution of scores on support for revolutionary change in Inglehart's Europeanoriented sample reveals the presence of an extreme outlier: South Africa (see Table A-1). Support for revolutionary change in this country is at the 25% level, almost twice as great as the other relatively high scores of 14%, 13%, and 12% for Portugal, Argentina, and Mexico, respectively. South Africa also has the lowest levels of democracy for both intervals and the most negative change, so it is obviously a potentially influential case. Equation 1.5 shows that when South Africa is deleted, the coefficient on support for revolutionary change is radically reduced in size to a nonsignificant value that is smaller than its standard error. However, since there is neither a good theoretical reason for deleting South Africa nor any reason to suspect that the score of 25% is due to measurement error, deletion of South Africa is arbitrary. A preferable remedy is to reduce the influence of South Africa's extreme score by logging the scores on the revolutionary change variable. Equation 1.6 shows that across all cases in the European-oriented sample, logged (base e) revolutionary change has no significant effect on change in democracy. So one may conclude that the significant negative effect of revolutionary change in equation 1.4 is an artifact of the extreme distance between South Africa's score and the other scores.7 Consequently, analysis of the components of the civic culture index only reinforces the inference that civic culture attitudes do not have a causal effect on democracy.

There is still one more avenue to explore, however, with the available cross-national data on civic culture attitudes. Support for revolutionary change is one of three options that respondents were asked to choose between in describing their attitude about social change (see Appendix A). The other choices were to defend the status quo against subversive forces or to improve society gradually by reforms. The problem with using support for revolutionary change as an indicator of a civic culture attitude is as follows. First, one has to ask what kind of civic culture attitude is being measured by support for revolutionary change. Although Inglehart (1988, 1990) does not address this

question, it is presumably system affect: support for revolutionary change implies a strong rejection of the existing political system and a preference for achieving societal change by the use of force and violence. Since violent rebellion has hardly ever resulted in the establishment of a democratic regime and since high levels of political violence are incompatible with stable democracy support for revolutionary change clearly is an attitude that is not supportive of democratic political institutions (Huntington 1984, 213-14; Powell 1982, 168-70). But lack of support for revolutionary change does not necessarily imply support for democratic institutions. Respondents who do not favor revolutionary change may prefer the option of defending their society against subversive forces. This kind of extremely conservative attitude about societal change implies support for repression of dissent, which could inhibit a country from establishing or maintaining a high level of democracy. Thus, the expected inverse relationship between support for revolutionary change and democratization will be weakened by the fact that people who oppose revolutionary change may not necessarily support democracy. Indeed, as can be seen from the distribution of scores on the defend society against subversives option (see Table A-1), sizable minorities of them endorse this conservative option; and this kind of attitude implies support for repressive measures by the state to suppress dissent, which would hinder democratization.

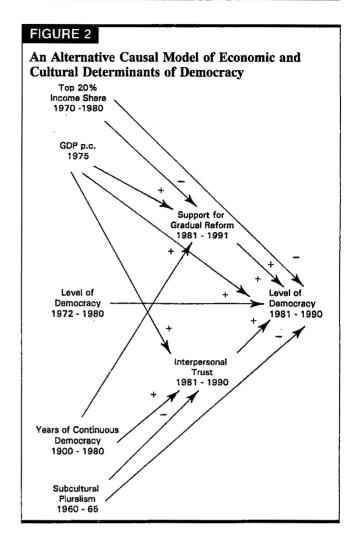

The *support* for gradual reform option is the attitude about societal change that in our view is most unambiguously supportive of democratic procedures. We assume that citizens who support democratic norms and institutions will prefer the gradual improvement of society by reforms over either revolutionary change or intransigent defense of the status quo. Therefore, we think that the system affect component of the civic culture concept is measured best by the percentage of the general public that supports gradual reform. A high level of support for gradual reform among the general public necessarily implies relatively low levels of support for the radical option of revolutionary change and the conservative option of defending society; a low level of support for gradual reform necessarily implies that either or both support for revolutionary change and intransigent defense of the status quo are relatively high. Therefore, we hypothesize that support for gradual reform will have a positive effect on change in democracy and that this positive effect will be much sharper than the negative effects of support for revolutionary change and defending the status quo.

The regression equations in the lower panel of Table 1 take the other attitudes about societal change into account. We focus first on the percentage of the general public that favors defending society against subversive forces. We expect that this attitude about societal change will have a negative but relatively weak effect on change in level of democracy. Equation 1.7 shows support for our hypothesis. Norway, however, is an extreme outlier (see Table A-1). An

unusually large proportion (49%) of the Norwegian general public favors defending society against subversive forces. This seems odd given the fact that only 16% of Swedes and 28% of Danes expressed support for the defend society option, so one might wonder if Norway's exceptionally high score is a result of measurement error. Therefore, equation 1.8 reestimates equation 1.7, with Norway excluded. Although the coefficient on defend society with Norway deleted almost doubles in size, it still is not significant for a one-tailed test (the t-ratio is -1.57). Thus, despite the possibility of measurement error in the Norwegian case, the negative relationship between support for intransigent defense of the status quo and change in democracy remains weak and nonsignificant.

Equations 1.9–12 include support for gradual reform as a determinant of change in level of democracy. In equation 1.9, the coefficient on support for gradual reform is positive and statistically significant, which supports our hypothesis. Although inspection of the distribution of scores on support for gradual reform does not reveal any extreme outliers (see Table A-1), Norway has the lowest score (49%). The relatively low level of support for gradual reform in Norway is due to the very large proportion of Norwegians who favor defending the status quo against subversive forces. If this is a reflection of measurement error, then inclusion of Norway may exert a downward bias on the regression coefficient for the support for gradual reform variable. Norway is therefore excluded in equation 1.10. As expected, the coefficient on gradual reform is larger (by approximately 50%) with Norway deleted, and its t-ratio is 3.0 instead of 2.29 with Norway included. Thus, exclusion of Norway favors our hypothesis even more strongly.

In equations 1.11 and 1.12, we introduce macrosocietal variables and retain Norway, since it would be arbitrary to exclude Norway on the suspicion of measurement error without having examined the actual wording in Norwegian of the question on attitude about societal change. Equation 1.11 shows that none of the macrosocietal variables in Inglehart's model has a significant effect on change in democracy, whereas the positive effect of support for gradual reform remains significant. Equation 1.12 includes income inequality (see Appendix B) and an indicator of the concept of subcultural pluralism, the index of ethnic and linguistic fractionalization (Taylor and Hudson 1971; tbl. 4.15, col. 3; original scores expressed as fractions between 0 and 1 are multiplied by 100). These two macrosocietal variables were omitted from Inglehart's model, but they have significant negative effects on change in democracy, as expected.⁸ The coefficient on support for gradual reform remains significant when income inequality and ethnolinguistic fractionalization are taken into account. The results of equations 1.11 and 1.12 thus show that the positive effect of support for gradual reform on change in democracy is not a spurious reflection of macrosocietal causes.

An Alternative Macro-Micro Causal Model

An alternative to Inglehart's causal model of economic and cultural determinants of democracy is shown in Figure 2. The important differences between Inglehart's model (Figure 1, model A) and ours are as follows. First, Inglehart's dependent variable (years of continuous democracy) is a predetermined independent variable in our model. This avoids the untenable assumption that civic culture attitudes measured in the 1980s cause previous years of continuous democracy. Our dependent variable is change in a country's average level of democracy from 1972-80 to 1981-90, that is, level of democracy during the 1980s independent of level of democracy during the 1970s. It is plausible to assume a priori that level of civic culture attitudes in the 1980s could be a cause of change in level of democracy from the 1970s to the 1980s. And the possibility of a reciprocal causal effect of experience of democracy on civic culture attitudes is incorporated into our model by inclusion of the years of continuous democracy variable as an antecedent cause of civic culture attitudes.

Second, the concept of civic culture is measured only by attitude about societal change and interpersonal trust. Life satisfaction (which is neither an attitude of specifically political culture nor a component of Almond and Verba's conceptualization of civic culture) is excluded. Also, instead of combining civic culture attitudes into a composite measure, we allow for the possibility that the relationships between these variables and change in democracy might differ in magnitude and significance. Furthermore, we replace support for revolutionary change with support for gradual reform because we think that the latter attitude about societal change is a much more unambiguous indicator of the kind of system affect that is most conducive to democracy.

Third, the percentage of the labor force employed in the tertiary sector is not included in our model because (1) we are skeptical about its validity as a proxy for the size of the middle class, (2) there is no evidence from large-sample quantitative cross-national research to indicate that it is a relevant determinant of variation in level of democracy, and (3) it is irrelevant either as a predictor of years of continuous democracy in model B (see Figure 1) or as a predictor of change in level of democracy (see equation 1.11). Instead, the alternative model includes—in addition to level of economic development-income inequality and subcultural pluralism, the two macrosocietal variables that we hypothesize are relevant causes of democratization omitted from Inglehart's model (equation 1.12 supports this hypothesis). Income inequality and subcultural pluralism are predicted to have negative effects on change in level of democracy. Also, support for gradual reform is expected to be higher in countries with lower levels of income inequality, while interpersonal trust is expected to be higher in homogeneous than in heterogeneous societies. And we include the possibility that level of economic development may have a positive effect on each of these civic culture attitudes.

Fourth, we treat the macrosocietal variables that are antecedent in time to level of democracy in 1981-90 as predetermined variables. Since our sample is limited by the small number of cases with information on civic culture attitudes, it is inappropriate for addressing the question of causal relationships between the macrosocietal variables, and this question is not relevant to our concern with linkages between structural characteristics of societies, civic culture attitudes, and democracy. The macroeconomic variables—income inequality and gross domestic product (GDP) per capita—are measured for the 1970s (see Appendix A). The ethnolinguistic fractionalization indicator of subcultural pluralism is available only for 1960-65. Years of continuous democracy is Inglehart's index dated to 1980. This variable should be highly correlated with level of democracy over 1972-80, as well as with the predetermined macroeconomic variables; but we do not expect it to have a direct influence on change in level of democracy that is independent of the other determinants of change in level of democracy.

The hypotheses to be tested are represented by the arrows of causation between the predetermined macrosocietal variables, the civic culture attitudes, and change in level of democracy. Support for Inglehart's

(1988, 1990) assumption that civic culture attitudes are a powerful unidirectional determinant of democracy will be found if support for gradual reform and/or interpersonal trust have strong effects on change in level of democracy, while long-term experience of democracy (years of continuous democracy, 1900-1980) does not have an effect on civic culture attitudes. Support for the hypothesis of reciprocal causation between civic culture and democracy, which Almond (1980) argues was the original hypothesis of The Civic Culture (Almond and Verba 1963), will be found if long-term experience of democracy has a positive effect on civic culture attitudes, and civic culture attitudes, in turn, have positive effects on change in level of democracy. Support for Barry's (1978) hypothesis that civic culture attitudes are primarily an effect rather than a cause of democracy will be found if long-term experience of democracy has a positive effect on civic culture attitudes and civic culture attitudes have no effect on change in level of democracy.

For the sake of simplicity, our causal model entails the assumption that there is no simultaneous causal effect of level of democracy during 1981–90 on civic culture attitudes during 1981–91. The validity of this assumption can be tested, however. If we find evidence of an effect of a civic culture attitude on change in democracy, then we will test for the possibility that the effect on change is inflated by simultaneity bias.

Determinants of Change in Level of Democracy

During the 1980s democracy expanded dramatically in the world. Many countries either inaugurated a democratic regime for the first time or else reestablished democratic rule after a previous lapse, and countries that had previously established stable democratic rule maintained it. Our data set-limited as it is mainly to European, North American, and Latin American countries—nevertheless reflects the global trend of the decade (see Appendix A). Four countries in our sample (Argentina, Greece, Spain, and Portugal) established stable democracy during the 1980s. In this group, the mean level of democracy during the 1970s had ranged from 42 to 68, and the mean level of democracy during the 1980s increased to a range of between 79 and 92. A fifth country, Honduras, came close to reaching the upper quarter of the democracy range (75 to 100), as its mean score changed from 43 over the 1970s to 73 over the 1980s. In addition to these instances of substantial gains in democratization, 16 countries maintained a high, stable mean level of democracy in the range of 83 to 100, with change in the range of less than ± 10 points. Only 6 countries did not either achieve or maintain a relatively high level of democracy. One of them, Panama, registered a gain in mean level of democracy of more than 10 points, but in this instance the change was from a very low level of democracy during the 1970s (20) to a relatively low level during the 1980s (39). The other five countries that remained at intermediate-tolow mean levels of democracy during the 1970s and

Note: Entries are unstandardized regression coefficients (standard errors in parentheses).

1980s were El Salvador, Guatemala, Mexico, Nicaragua, and South Africa, where slight decreases occurred. The largest decrease was in South Africa, which declined from a mean democracy score of 34 over the 1970s to a mean of 27 over the 1980s.

We use the expanded sample of 27 countries to test the hypotheses of our alternative causal model. Inclusion of the six Central American countries substantially increases variation on the measures of democracy, since, with the exception of Costa Rica, these countries have low-to-intermediate scores on level of democracy during 1972–80 and 1981–90, and no years of continuous democracy from 1900 to 1980. Variation on the macroeconomic variables is also increased substantially, especially in regard to GDP per capita, since all of the Central American countries have lower levels of this indicator of economic development than any of the countries in Inglehart's sample.

The predictions of the alternative causal model about determinants of change in level of democracy are tested by the regression equations reported in Table 2.9 Equation 2.1 includes all of the explanatory variables except for income inequality, which is omitted because of missing data for Greece and Luxembourg. First, in regard to the civic culture attitudes, the coefficient on support for gradual reform is posi-

tive as expected and statistically significant. By contrast, the coefficient on interpersonal trust is not significant. These results are consistent with the findings from Inglehart's smaller European-oriented sample of no effect of interpersonal trust on change in democracy (equation 1.3) but a positive effect of support for gradual reform (equations 1.9-12). Variation in the percentage of the general public with high interpersonal trust thus appears to be irrelevant for democratization; whereas democratization is facilitated by the extent to which the general public favors gradual reform. 10 Second, in regard to the macrosocietal variables, years of continuous democracy does not have a significant direct effect on change in level of democracy, as we expected; but the coefficients on GDP per capita and ethnolinguistic fractionalization are significant and in the expected direction. The finding of a significant positive effect of level of economic development on change in democracy for the expanded sample differs from the finding of no effect for the European-oriented sample (see equation 1.11). This difference appears to be due to the fact that the expanded sample has greater variation in level of economic development than the Europeanoriented sample.11

Equation 2.2 includes income inequality. The coefficient on this variable is negative as expected; and it

[&]quot; Greece included.

^b Norway excluded.

^{*} $p \le .05$, one-tailed.

is more than three times as large as its standard error (t-ratio of -3.23), indicative of a strong inverse influence of income inequality on change in level of democracy. Also, when income inequality is taken into account, the coefficient on GDP per capita is reduced effectively to zero. There is a strong negative correlation between GDP per capita and income inequality (r = -.838); and the results of equation 2.2 indicate that income inequality is the variable with direct causal influence on democratization, while the effect of GDP per capita is indirect through its association with income inequality. This inference appears to be valid, despite the high correlation between these variables. If multicollinearity were a serious problem, then both of the parameter estimates would be imprecise and nonsignificant because their standard errors would be high. This is clearly not the case in regard to equation 2.2, however, since the coefficient on income inequality is much higher than its standard error. Another consequence of multicollinearity (if it is a problem) is that parameter estimates are unstable in the face of slight variations in the data matrix due to addition or deletion of observations or variables. This possibility is addressed in equations 2.3-5, which also focus on other concerns.

The two obviously irrelevant variables, interpersonal trust and years of continuous democracy, are deleted in equation 2.3; and we add two omitted variables, the percentage of the labor force in service occupations and the percentage of the population that is Protestant. 12 This equation is a test for the possibility of omitted-variable bias. The labor force in services variable was excluded a priori for the reasons given in our discussion of the alternative causal model (see Figure 2). Also, although Protestantism historically has been associated positively with a country's level of democracy (see Bollen and Jackman 1985), we do not think that Protestantism is relevant for explaining change in democracy from the 1970s to the 1980s because by this time all Protestant countries were stable democracies and the Catholic Church had become quite supportive of democracy. The results of equation 2.3 support our assumptions about the irrelevance of the labor force in services and Protestantism, since these variables do not have significant effects on change in level of democracy. Moreover, inclusion of them in the equation does not alter the pattern of effects observed in equation 2.2 for the highly correlated variables, income inequality, and GDP per capita.

Equation 2.1 was estimated across the full sample of 27 cases, but equation 2.2 could be estimated for only 25 cases because Greece and Luxembourg are missing data on income inequality for circa 1970–80. Equation 2.4 addresses the question of whether the absence of these cases affects the parameter estimates. Since income distribution in Luxembourg has never been measured to our knowledge, it is not possible to include that case. But in the case of Greece it is possible to substitute a 1957 measurement of the share received by the upper quintile of households

(49.5%) reported by Paukert (1973). We observe that when the circa 1960 income inequality score for Greece is included, the coefficient on income inequality is significant and the coefficient on GDP per capita is not significant, just as in equations 2.2 and 2.3. Also, support for gradual reform again has a significant positive effect on change in democracy. Thus missing data does not seem to be affecting the parameter estimates.

Equation 2.5 tests for the possibility that the parameter estimates could be affected by the case of Norway, where the comparatively very low score on support for gradual reform may be a reflection of measurement error. When Norway is deleted, the coefficient on gradual reform is higher than in the equations that include Norway (as expected), but the difference is relatively slight; and the other parameter estimates are quite similar. The possibility of measurement error in the Norwegian case thus has no significant influence on the results.

The irrelevant GDP per capita variable is deleted in equation 2.6, which is the best "trimmed" equation for predicting change in democracy from the 1970s to the 1980s. It explains 87% of the variance in change in level of democracy. The coefficients on the explanatory variables appear to be reliable estimates, since they are all more than twice their standard error and do not appear to be sensitive to multicollinearity, omitted variable bias, or measurement error. The most interesting substantive finding is the positive effect of the percentage of the general public that supports gradual reform on change in level of democracy, which supports the inference that variation in civic culture, at least as measured by this kind of attitude, may have causal influence on democratization. Now we need to address the question of whether the magnitude of this effect might be inflated by the possibility of a simultaneous reciprocal effect of level of democracy during 1980-90 on level of support for gradual reform during 1981-91. For level of democracy during 1981-90 to have an effect on level of support for gradual reform during 1981-91, a significant positive correlation must obtain between these variables. But that is not the case. The correlation between support for gradual reform during 1981-91 and level of democracy during 1981-90 is very close to zero (r = +.058). Therefore, the assumption that we made of no simultaneous reciprocal causation is supported.

Another important question to address in regard to the trimmed equation is the robustness of the direct effects of support for gradual reform, income inequality, and ethnolinguistic fractionalization on change in level of democracy. Given the relatively small number of cases even in the expanded sample, it is possible that the ordinary least squares (OLS) parameter estimates could be unreliable due to nonnormal residuals reflecting the presence of outliers, otherwise influential cases, and heteroscedastic distributions on the variables. Diagnostics can be used to detect the presence of specific cases that might be unusually influential. And there are alternative esti-

mation techniques that correct for violations of OLS assumptions.

A casewise plot of the standardized residuals from equation 2.6 is shown in Figure 3 along with each country's DFITS value. Velleman and Welsch suggest

that for small samples, a case with a DFITS value greater than three times the absolute magnitude of the square root of the ratio of parameters to cases is potentially influential (1981, 236–37). This cutoff point for equation 2.6 is 1.34. The only case with a DFITS value above 1.34 is Honduras (1.69). An alternative criterion is a change in fit greater than the absolute magnitude of the standard error (1.0) of fitted values (see Moon and Dixon 1992, 208). In addition to Honduras, Nicaragua has a DFITS value (-1.06) that exceeds this criterion. 13 These cases have the highest standardized residuals (2.04 and -2.06, respectively); but they are not severe outliers and in fact are relatively well predicted, since their residuals are very close to the range of ± 2 . The other cases are quite well predicted by equation 2.6.

The equations reported in Table 3 compare the OLS results for 2.6 (col. 1) with a variety of alternative estimation methods. First, we calculate the coefficients and their standard errors by bootstrapping, a nonparametric method of estimation that does not depend on the distributional assumptions of OLS (see e.g., Dietz, Frey, and Kaloff 1987; Golden 1993). The bootstrapped estimates derived from 200 replications are reported in equation 3.1. They are either identical or very similar to the OLS estimates. Second, we adjust for the possibility of heteroscedasticity by using a heteroscedasticity-consistent covariance matrix to calculate standard errors of the OLS regression coefficients (see Moon and Dixon 1992). The standard errors calculated by this method are reported in equation 3.2. They are quite similar to the OLS standard errors. Third, we use the least absolute error method for calculating "robust" estimators that are insensitive to nonnormal residuals (see, e.g., Dietz, Frey, and Kaloff 1987; Moon and Dixon 1992). The least absolute error estimators are reported in equation 3.3. Here we observe that the coefficients on

support for gradual reform and ethnolinguistic fractionalization are reduced somewhat; but since these coefficients are still much larger than their standard errors, the differences are inconsequential substantively. Fourth, we use bounded influence estimators that reduce the influence of cases with high DFFITS values (see Moon and Dixon 1992). The bounded influence estimators reported in equation 3.4 are slightly smaller than the OLS estimators for support for gradual reform and ethnolinguistic fractionalization, and they are somewhat higher for income inequality and ethnolinguistic fractionalization. But again there are no substantive differences. In sum, the results of equations 3.1–4 indicate that the OLS parameter estimates of equation 2.6 are robust.

Determinants of Civic Culture Attitudes

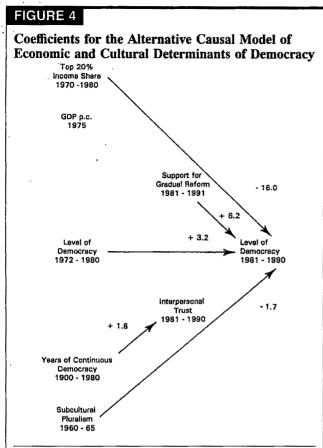

We now turn to the question of the influence of democracy on civic culture attitudes. The predictions of the alternative causal model about determinants of civic culture attitudes are tested by the regression equations reported in Table 4. These equations assume that there are no simultaneous causal relationships between support for gradual reform and interpersonal trust. That assumption is supported by the fact that these variables are uncorrelated both in the full extended sample (r = -.153, N = 27) and in the extended sample of 25 cases with information on all variables (r = -.122).

The first prediction equation for support for gradual reform (equation 4.1) is estimated across all 27 cases and excludes income inequality because of missing data. None of the macrosocietal variables have significant effects on support for gradual reform. This is because there are no significant bivariate correlations between any of the macrosocietal variables and support for gradual reform. ¹⁴ Equation 4.2 shows that the macrosocietal variables also do not have significant effects on support for gradual reform when income inequality is included as a predictor. Again, this reflects the absence of significant bivariate association between the macrosocietal variables and support for gradual reform. ¹⁵ Equation 4.3 excludes Norway due to the possibility of measurement error, but deletion of Norway has no appreciable effect on the results.

Interpersonal trust, by contrast, is correlated significantly and positively with level of democracy (1972–80) and years of continuous democracy (1900–80) in the full extended sample; ¹⁶ and it is correlated significantly and positively with these variables and significantly and negatively with income inequality in the extended sample of 25 cases. ¹⁷ Equations 4.4 and 4.5 show that in the multivariate context the only significant predictor of interpersonal trust is years of continuous democracy. Equation 4.6 is the trimmed equation (nonsignificant variables deleted) for interpersonal trust estimated across the sample with information on all the variables in the causal model.

Estimates of Causal Impact

Figure 4 shows the estimates of causal impact for our causal model of relationships between macrosocietal structural variables, civic culture attitudes of the general public, and democracy. ¹⁸ The results of testing this model of change in level of democracy do not support the argument that civic culture attitudes are the most important determinant of democratization.

Note: The coefficients are the ordinary least squares regression coefficients for equations with variables having nonsignificant coefficients deleted, where each coefficient is multiplied by 10 to show the impact of a change of 10 units in the independent variable on the dependent variable.

For this sample, the most important determinant is income inequality, which has a strong negative effect on change in level of democracy; that is, an increase of 10 percentage points in the size of the upperquintile income share is associated with a decrease of 16 points in level of democracy. The other macroeconomic variable—level of economic development as measured by GDP per capita—has no direct effect on change in level of democracy. Since there is a strong inverse correlation between GDP per capita and the size of the upper quintile income share, economic development is relevant to democratization indirectly, through its association with income inequality. The other structural variable that is directly relevant to democratization—ethnolinguistic fractionalization —has a small negative effect on change in level of democracy; that is, an increase of 10 points in a country's level of ethnolinguistic fractionalization is associated with a decrease of only 1.7 points in its level of democracy.

Our argument about the importance of analyzing the two civic culture attitudes separately is strongly supported. The percentage of the general public that supports gradual reform is empirically unrelated to the percentage with high interpersonal trust; and these variables also have very different relationships with democracy. Support for gradual reform has a positive effect on change in level of democracy (i.e., an increase of 10 percentage points in the general public supporting gradual reform is associated with an increase of 6.2 points in a country's level of democracy) and is unrelated to long-term experience of democracy. The findings regarding support for gradual reform thus support the hypothesis of a unidirectional effect of civic culture on democracy. By contrast, the findings regarding interpersonal trust support the hypothesis of a unidirectional effect of democracy on civic culture. This is because interpersonal trust is unrelated to change in level of democracy but long-term experience of democracy has a positive effect on interpersonal trust; that is, an increase of 10 years of continuous democracy is associated with an increase of 1.8 percentage points in the proportion of the general public with high interpersonal trust.

CONCLUSION

We addressed the question of the relevance of attitudes of the general public for the establishment of stable democratic regimes by testing a causal model of macrosocietal and microattitudinal determinants of change in level of democracy. The model was designed to enable us to draw inferences about the possibility of unidirectional or reciprocal causation between civic culture attitudes and democracy. Although our sample of countries for testing the model is restricted to a maximum of 27 cases with data on civic culture attitudes, it nevertheless contains reasonably large variation on change in democracy that corresponds to the global trend of the 1970s and 1980s. So, despite its limitations, our data set affords an opportunity to go beyond speculation and actually test hypotheses about the relative importance of civic culture attitudes for democratization.

Interpersonal trust is one kind of civic culture attitude that has been assumed by many scholars to be an important attitudinal prerequisite of the establishment of stable democracy (e.g., Almond and Verba 1963; Dahl 1971; Inglehart 1988, 1990). However, we found that variation in the percentage of the general public with a high level of interpersonal trust is unrelated to change in a country's level of democracy. Low levels of interpersonal trust thus do not appear to be an impediment to democratization: Argentina, Portugal, and Spain registered substantial increases in level of democracy from the 1970s to the 1980s despite relatively low interpersonal trust levels of 21%, 28%, and 35%, respectively; and Belgium, France, and Italy were able to maintain high levels of stable democracy despite low interpersonal trust levels of 29%, 26%, and 27%, respectively. Relatively high levels of interpersonal trust also do not necessarily promote democratization. Neither Guatemala nor Panama were able to move above intermediate levels of democracy despite above-average interpersonal trust levels of 40% and 43%, respectively. (The

average level of interpersonal trust for all 27 countries was 39%.)

Interpersonal trust is not unrelated to democracy, however. A country's long-term experience of democracy (as measured by its years of continuous democracy since 1900) is estimated to have a positive effect of moderate magnitude on the percentage of the general public with a high level of interpersonal trust. In our view, this is not surprising. Democracy works in practice through the peaceful collective action of groups of citizens; and because peaceful collective action is grounded in a spirit of cooperation, the institutional opportunities for peaceful collective action afforded by democratic regimes could be expected to promote relatively high levels of interpersonal trust.

Although interpersonal trust appears to be a product of democracy rather than a cause of it, there is one kind of attitude that supports the civic culture thesis. This is the percentage of the general public that prefers to change society by gradual reform instead of changing it by revolutionary action or defending it staunchly against subversive forces. Support for gradual reform has a positive effect on change in level of democracy, and it is unrelated to long-term experience of democracy. Thus the strong assumption made by Inglehart (1988, 1990) of a unidirectional causal effect of civic culture on democracy is supported in this instance.

There is an interesting implication of the fact that support for gradual reform not only is not a function of prior experience of democracy but also is not associated with any of the other structural variables in our causal model. The level of support for gradual reform in a country is independent of (and so is not constrained by) its level of economic development, the extent to which income is distributed unequally, and the subcultural heterogeneity of its population. Therefore, a high level of support for gradual reform could compensate for the presence of levels of these structural variables that are not conducive to democratization. A case in point is Honduras. Honduras has the lowest level of economic development of all the countries in our sample, and it has the highest level of income inequality. But in Honduras, 85% of the general public prefers gradual reform to revolutionary change or defending the status quo, which is the highest level of support for gradual reform of all the countries in our sample. It is possible that the very high level of support for gradual reform among the Honduran general public could have had a strong or even decisive influence on the transition from authoritarian rule to democracy in this country whose prospect for democracy from the perspective of macroeconomic preconditions was quite poor.

Although support for gradual reform appears to be an important civic culture attitude because it can promote democratization even in countries that lack conducive structural properties, nevertheless, in evaluating the civic culture theory one must keep the following caveats in mind. First, the magnitude of the positive effect of support for gradual reform on change in democracy is relatively small in comparison with the magnitude of the negative effect of income inequality. Second, the other variables included by Inglehart under the rubric of civic culture do not have statistically significant effects on change in democracy. Thus, overall, the results of our analysis of causal linkages between levels of civic culture attitudes and change in level of democracy are not supportive of the thesis that civic culture attitudes are the principal or even a major cause of democracy.

Our conclusion about the causal relevance of civic culture attitudes for democracy is thus at odds with Inglehart's (1988, 1990) conclusion. Since we are confident that our findings are robust statistically, we doubt that relationships more supportive of the civic culture thesis will be found with larger and more geographically diverse samples. However, it is certainly possible that the single-item indicators of civic culture attitudes used by us and by Inglehart are too crude and that stronger causal relationships might be found with potentially more reliable multiitem indexes.

The single most important explanatory variable in our causal model of determinants of democratization is not an attitude of the general public but rather a macroeconomic variable—income inequality. The size of the income share of the richest quintile of households in a country was found to have a relatively strong negative effect on change in level of democracy from the 1970s to the 1980s. The transitions from authoritarian rule to stable democracy (so far) in Argentina, Portugal, and Spain appear to have been facilitated by the existence of relatively egalitarian distributions of income (upper-quintile income shares in the range of 41% to 50%). By contrast, the continuation of relatively low levels of democracy during the 1970s and 1980s in El Salvador, Guatemala, Mexico, Nicaragua, Panama, and South Africa has gone hand-in-hand with extremely inegalitarian distributions of income (upper-quintile income shares in the range of 57% to 61%). We think that there is a compelling causal logic for why high levels of income inequality would make it difficult to sustain a high mean level of democracy for very long. High levels of income inequality are likely to produce either a high level of rebellious political conflict (Muller and Seligson 1987) or else the perception among elites of a threat of rebellious political conflict and lower-class revolution. Therefore, executive or military coups to quell mass rebellion and preserve elite privileges are likely to occur in countries with inegalitarian distributions of income that attempt to establish de-

In future macro-micro research designs a useful new direction to take may be to shift the focus at the micro level from attitudes of the general public to attitudes of elites. Since elites have greater opportunity and ability than the general public to influence the kind of regime a country will have, their attitudes should be given special emphasis in political culture models. Dahl (1971) attributes great importance to the attitudes of political activists and leaders as a cause of the establishment and stability of democracy. Higley

and Burton (1989) make the even stronger argument that the single critical determinant of the stability of democratic regimes is consensus among elites in general on support for democratic institutions and values.

Empirical support for an emphasis on elite attitudes is provided by the pioneering study of Gibson (1988), which is limited however to secondary analysis of relatively old data collected in the mid-1950s for only a single country, the United States. Gibson tested a causal model of relationships between attitudes of political tolerance in the general public, political tolerance of elites, and repressive political legislation of state governments. He found statistical support for the inference that variation in the extent of repressive legislation against communists during the late 1940s and 1950s was an inverse function of the level of elite political intolerance and that the level of political intolerance among the general public was not directly relevant (although it was highly correlated with the level of elite intolerance). In the context of the causal model tested here, an important open question is whether change in the repressiveness of the political system, as measured by change in level of democracy, is affected by the level of support for gradual reform among the general public when variation in elite support for gradual reform is taken into account.²¹ Thus, a final caveat in regard to the civic culture thesis is that we do not know whether the apparent positive influence on change in democracy of support for gradual reform among the general public is a genuine effect or is a spurious reflection of association between general public attitudes and elite attitudes, which might be the operative causal variable.

APPENDIX A: DATA

Scores on the democracy, macroeconomic, and civic culture variables are reported in Table A-1 for the 27 countries with information on attitudes about social change and interpersonal trust. The countries are listed in descending order of their level of gross domestic product per capita in 1975. The six Central American countries all have gross domestic product per capita scores below that of Portugal, the poorest country in Inglehart's European-oriented sample,

which dramatically increases the variability on gross domestic product per capita.

The measurements of mean level of democracy over 1981-90 and 1972-80 are given in columns 1 and 2. These scores are derived from annual Freedom House rankings of political rights and civil liberties, converted to a scale of 0-100 (see Freedom House publications Freedom at Issue, Jan./Feb. 1990 and Freedom Review 22, no. 1 [1990]; see also Gastil 1986, 1988).²² The 1980s were a decade of expansion of democracy throughout the world, and our sample of primarily European and Latin American states reflects this trend. The expansion trend began in the late 1970s with transitions from authoritarian to democratic rule in Portugal and Spain. In Latin America, where almost all states were governed by authoritarian regimes in the mid-1970s, there was an extraordinary shift to democracy in the 1980s, so that by 1990 almost all Latin American states were under democratic rule or close to it. The old European and European-heritage democracies (plus Japan) in our sample maintained very high levels of democracy during the 1970s and 1980s; the Southern European states Portugal and Spain increased their level of democracy substantially from the 1970s to the 1980s; and the level of democracy in two Latin American states, Argentina and Honduras, also increased substantially. Declines in democracy of five points (rounded) or more occurred only in El Salvador, Germany, Guatemala, and South Africa.

Scores on the macroeconomic variables are listed in the third and fourth columns of Table A-1. Income inequality is measured by the size of the income share received by the upper quintile of households, averaged for circa 1970 and circa 1980.²³ Greece and Luxembourg are missing data on income inequality. Economic development is measured by real gross domestic product per capita in 1975 (Summers and Heston 1988).

Data on attitude about societal change are listed in Table A-1, columns 5-7. The percentage of respondents in each country who chose the first of three options is listed in the column 5, the percentage that chose the second option is listed in the column 6, and the percentage that chose the third option is listed in the column 7. The options were presented as follows:

On this card are three basic kinds of attitudes concerning the kind of society we live in. Please choose the one that best describes your own opinion:

- 1. The entire way our society is organized must be radically changed by revolutionary action.
- 2. Our society must be gradually improved by reforms.
- Our present society must be valiantly defended against all subversive forces.

Support for revolutionary change among the general public is very low in most of the countries in our sample. It is below the 10% level in 20 countries, marginally above 10% in four countries (Nicaragua, Mexico, Argentina, and Portugal), and reaches a level of 25% only in the case of South Africa. Support for gradual reform is quite high in Honduras (85%), El

Salvador (82.3%), Spain (82%), and Sweden (80%); it is comparatively low in Panama (65%), Germany (59%), South Africa (54%), and Norway (49%). Support for defending the status quo against subversive forces ranges from a low of 10% in Argentina and Spain to highs of 38% and 49% in Germany and Norway, respectively.

Table A-1, column 8 is the percentage of respondents who believe that most people in their country are either fairly or very trustworthy. There is considerable cross-national variation in levels of interpersonal trust. Interpersonal trust is highest in the Scandinavian countries (Denmark, Norway, and Sweden), where the level of trust in one's compatriots ranges between 52.5% and 60%. The lowest levels of interpersonal trust are found in Argentina, France, and Mexico, where one-quarter or less of the general public think that others in their country are fairly or very trustworthy.

APPENDIX B: THE CENTRAL AMERICAN PUBLIC OPINION PROJECT

The Central American Public Opinion Project of the University of Pittsburgh²⁴ was designed to measure the opinion of Central Americans on a wide variety of issues and included the interpersonal trust and system affect questions used here. The samples drawn from each country were designed to be representative of the urban population.²⁵ The decision to focus on urban areas was made in order to avoid the high cost of interviewing in rural areas, which, in these countries, are often not easily accessible.

Country samples were of area probability design. In each country, the most recent population census data were used. Within each stratum, census maps were used to select, at random, an appropriate number of political subdivisions (e.g., districts), and within each subdivision, the census maps were used to select an appropriate number of segments from which to draw the interviews. Within the household, all voting-age residents were eligible for selection, and one was chosen at random (using either the "next birthday system" or a sex/age quota system).

Costa Rica was designated as the country for the pilot test of the survey items. That sample was gathered in fall 1990. The surveys in the other five countries were then conducted during the summer of 1991 and the winter of 1991–92. The design called for samples of at least 500 up to a maximum of 1,000 respondents from each country. The sample sizes for each country are as follows: Guatemala, 904; El Salvador, 910; Honduras, 566; Nicaragua, 704; Costa Rica, 597; and Panama, 500.

Notes

An earlier version of this paper was presented at the 1993 meeting of the Midwest Political Science Association, Chicago, and as a public lecture in Managua, Nicaragua that same

year sponsored by the Centro de Educacion para la Democracia. We are grateful for the helpful comments that we received at these presentations. We also would like to thank Hortense Dicker, coordinator of the Nicaragua Education for Democracy Project of the American Federation of Teachers, for her assistance in arranging the lecture in Managua.

1. In responding to Barry's counterhypothesis, Almond emphasizes that in *The Civic Culture* the relationship between civic culture and democracy was conceptualized as entailing reciprocal causation: "political culture is treated as both an independent and a dependent variable, as causing structure and as being caused by it" (1980, 29).

- 2. Inglehart's article reports the number of cases as 24 (1988, 1219); but his book reports the number of cases as 22 (1990, 45). From the data reported in the book we find only 20 countries with scores on all three components of civic culture. These are the first 21 countries listed in Table A-1, except for Mexico (which is missing information on life satisfaction). We constructed the composite civic culture index by (1) subtracting scores on the support for revolutionary change variable from 100 so that scores are the percentage who oppose revolutionary change, (2) multiplying life satisfaction scores (originally on a 0-10 scale) by 10 so that the range of the scale is the same as for opposition to revolutionary change and interpersonal trust (0-100), and (3) computing the mean of the three variables. Gross national product per capita is the average for 1955 and 1960 if data are available for both years; otherwise it is either 1955 or 1960. Gross national product per capita and the percentage of the labor force in the tertiary sector in 1965 are from the data tape for the second edition of The World Handbook of Social and Political Indicators (Taylor and Hudson 1972).
- 3. Inglehart used LISREL to estimate path coefficients, whereas we use ordinary least squares regression. The path coefficients are standardized regression coefficients or beta weights.
- 4. The coefficient on years of continuous democracy is \pm .16 with a standard error of .04 (t-ratio of 3.83), the coefficient on labor force in the tertiary sector is \pm .16 with a standard error of .20 (t-ratio of \pm .81), and the coefficient on GNP per capita is \pm .0018 with a standard error of .0025 (t-ratio of .74). When the nonsignificant variables are trimmed from the equation, the standardized regression coefficient of \pm .83 for years of continuous democracy is the same as the bivariate correlation between years of continuous democracy and civic culture.
- 5. The coefficient on labor force in the tertiary sector is 1.40 with a standard error of 1.08 (t-ratio of 1.30) and the coefficient on GNP per capita is +.024 with a standard error of .013 (t-ratio of 1.85). The coefficient on GNP per capita is significant at the .05 level for a one-tailed test.
- 6. The number of cases for the separate components of the civic culture index is greater than 20 because an additional five countries have information on one or two (but not all three) of the components. Austria and Switzerland have information on life satisfaction only, Finland and Hungary have information on life satisfaction and interpersonal trust, and Mexico has information on interpersonal trust and support for revolutionary change. Thus the number of cases is 24 for life satisfaction, 23 for interpersonal trust, and 21 for support for revolutionary change.
- 7. South África's logged support for revolutionary change score is 3.22, and the other countries with support for revolutionary change of 10% or more have logged scores of 2.64 (Portugal), 2.56 (Argentina), and 2.48 (Mexico). The negative effect of support for revolutionary change washes out when logged scores are used because in contrast to the decline in level of democracy experienced by South Africa, the other countries with high logged scores that are close to that of South Africa experienced either substantial increases in democracy (Portugal and Argentina) or little change (Mexico).
- 8. The number of cases is 19 because Greece and Luxembourg are missing data on income inequality.
- 9. Since level of democracy 1972–80 is included in these equations, the effects of the other independent variables on level of democracy 1981–90 are effects on change in democ-

racy (i.e., the level of current democracy independent of its previous level).

10. We also tested for the possibility that support for revolutionary change might have a negative effect on change in level of democracy. If support for gradual reform is replaced by support for revolutionary change in equation 2.1, the coefficient on support for revolutionary change is -.27, and its standard error is .76; support for revolutionary change thus has no significant effect on change in democracy in the larger sample, even with the extreme score of South Africa included. Alternatively, if logged support for revolutionary change is used, the coefficient on this variable is extremely small relative to its standard error (-.22 and 6.60, respectively). These findings for the larger sample reinforce our conclusion from the results of equations 1.5 and 1.6 that variation in the level of support for revolutionary change has no significant effect on change in level of democracy; and they thus support the assumption of our alternative causal model that the attitude about social change relevant for democratization is support for gradual reform rather than support for revolutionary change.

11. If equation 2.1 is estimated only for the 21 cases in the European-oriented sample, the coefficient on GDP per capita in 1975 is not significant (.05 level, one-tailed test), whereas the coefficients on support for gradual reform and ethnolinguistic fractionalization remain significant. Therefore, it must be the difference in variation of GDP per capita between the two samples that is responsible for the different effects instead of differences in model specification or in the indicator of level of economic development (GDP vs. GNP) or its timing (1975 vs. 1955–60).

12. Data on the percentage of the labor force in services for 1977 is from Taylor and Jodice 1983 vol. 1, tbl. 6.3. Data on the percentage of the population that is Protestant circa 1964 is from Taylor and Hudson 1972, tbl. 4.16.

13. If equation 2.6 is reestimated with Honduras deleted, adjusted R-squared increases to .90 and all of the coefficients on the explanatory variables remain significant at the .05 level (one-tailed) and are greater than twice their standard error. If Nicaragua is deleted, adjusted R-squared is approximately the same (.88), and the explanatory variables again remain significant and greater than twice their standard error. The only notable consequence of deleting Honduras is that the coefficient on income inequality becomes 5, instead of 4 times its standard error, while the only notable consequence of deleting Nicaragua is that the coefficient on ethnolinguistic fractionalization becomes 3 instead of 2 times its standard error. Thus these cases do not appear to be substantively influential.

14. The correlations for N=27 between support for gradual reform and level of democracy, 1972–80; years of continuous democracy, 1900–1980; GDP per capita 1975; and ethnolinguistic fractionalization 1960–65 are -.116, -.150, -.283, and +.007, respectively.

15. The correlations for N = 25 between support for gradual reform and level of democracy, 1972–80; years of continuous democracy, 1900–1980; top 20% income share; GDP per capita 1975; and ethnolinguistic fractionalization 1960–65 are –129, –189, +.191, –.320, and –.025, respectively.

16. The correlations for N=27 between interpersonal trust and level of democracy, 1972–80; years of continuous democracy, 1900–1980; GDP per capita, 1975; and ethnolinguistic fractionalization, 1960–65 are +.351, +.480, +.222, and -.196, respectively.

17. The correlations for N=25 between interpersonal trust and level of democracy, 1972–80; years of continuous democracy, 1900–1980; top 20% income share; GDP per capita 1975; and ethnolinguistic fractionalization, 1960–65 are +.397, +.582, -.347, +.294, and -.188, respectively.

18. Since the determinants of level of democracy, 1981–90, are measured by scales that range theoretically from zero to one hundred, their relative importance can be compared using the OLS regression coefficients from equation 2.6. Since none of the predetermined macrosocietal variables are correlated significantly with support for gradual reform, no impact coefficients for them are shown. The impact coefficient for the

effect of years of continuous democracy on interpersonal trust is the OLS regression coefficient from equation 4.6.

19. In addition to interpersonal trust, life satisfaction (analyzed for the European-oriented sample only) and support for revolutionary change (analyzed for the European-oriented sample and the extended sample) were found to be irrelevant to change in level of democracy.

20. Muller (1988) found a very strong relationship between income inequality and the likelihood of a country maintaining stable democracy during 1961-80 for a sample of 33 countries but no significant relationship between income inequality and the likelihood of a country inaugurating democracy during 1945-61 for a sample of 27 countries. In regard to the latter sample, only four of these countries had relatively egalitarian distributions of income (an upper quintile share of 50% or less). Three of them did inaugurate democracy (Italy, Malaysia, and West Germany) and one did not (Chad). By contrast, among the 13 countries with very inegalitarian distributions of income (an upper quintile share of 55% or more), six did not inaugurate democracy (Colombia, Gabon, Iraq, Madagascar, Mexico, and Senegal) but seven did inaugurate it (Brazil, Costa Rica, Guatemala, Jamaica, Lebanon, Panama, and Peru). The absence of a relationship between income inequality and the likelihood of inaugurating democracy is therefore due primarily to the fact that a majority of the countries with very inegalitarian distributions of income nevertheless did attempt to establish democratic regimes. Most of them were unsuccessful, however, as breakdowns of democracy due to military coup and/or civil war occurred in Brazil, Lebanon, Guatemala, Panama, and Peru. Thus the inauguration of democracy may be facilitated by relatively low levels of income inequality, although there can be exceptions-perhaps especially if a country is very poor, like Chad. High levels of income inequality do not necessarily appear to inhibit the inauguration of democracy; however, they do make it unlikely that a country will maintain a high, stable level of democracy for very long.

21. There are several cases in our sample that suggest the possibility that the level of elite support for gradual reform might be as important as (or even more important than) the level of support for gradual reform in the general public. The countries with the lowest levels of support for gradual reform are Norway, South Africa, and Germany, where gradual reform is supported by 49%, 54%, and 59% of the general public, respectively. In the case of Norway, the comparatively very low level of support for gradual reform is due to an unusually high level of support for defending the status quo against subversive forces, which could of course reflect measurement error. Alternatively, in a stable democracy like Norway, elite support for gradual reform might be much higher than the level found in the general public. In Germany, the relatively low level of support for gradual reform among the general public also is due to a relatively high level of support for defending the status quo against subversives; and the stability of German democracy also might depend more on elite attitudes. In the case of South Africa, the very low level of support for gradual reform in the general public coincided with a low level of democracy during the 1970s that declined to an even lower level in the 1980s; but South Africa currently is in the process of attempting to establish a democratic regime. We doubt that support for gradual reform among the general public recently has undergone any sudden, dramatic increase. Rather, our guess is that there must be considerably greater support for gradual reform among South African elites than among the general public and that elite preference for gradual reform over revolutionary change or staunch defense of the status quo is the driving force behind the movement for democracy in South Africa, which also could have the effect of gradually raising the level of support for gradual reform among the general public. Thus, if we had information on elite support for gradual reform, it is possible that this variable could have an independent positive effect on change in level of democracy that might be stronger than that of support for gradual reform in the general public and consequently would provide stronger support for the role of attitudes as a determinant of democratization.

22. In Freedom in the World, ratings listed for years 1973–82 are for the previous year, and ratings listed for 1983 to 1987 are for the current year (Gastil 1986, tbl. 6; idem 1988, tbl. 6).

23. The sources of these data are the World Bank (Ahluwalia 1976; World Bank 1979, 1984, 1989, 1990); the United Nations Economic Commission for Latin America (Comisión Económica para América Latina 1983); the Organization for Economic Development and Cooperation (Sawyer 1976); and the International Labor Organization (Lecaillon et al. 1984)-W, U, O, and I, respectively. Data for circa 1970 encompass the interval 1964–74, and data for circa 1980 encompass the interval 1975–84. If multiple observations were available, the one for the year closest to the midpoint of the interval was used. The sources and years (with circa 1970 and circa 1980 scores in parentheses in the case of averages) are as follows for each country: Argentina, W:70 (no data for circa 1980); Australia, average of W:66–67 (38.8) and W:75–76 (47.1); Belgium, average of W:74–75 (39.8) and W:78–79 (36.0); Canada, average of W:69 (41.0) and W:81 (40.0); Costa Rica, average of U:70 (50.6) and U:80 (49.0); Denmark, W:81 (no data for circa 1970); El Salvador, average of U:70 (50.8) and U:80 (66.6); France, average of W:70 (46.9) and W:79 (40.8); Germany, average of O:70 (45.6) and W:78 (39.5); Guatemala, average of U:70 (58.8) and U:80 (54.1); Honduras, average of U:70 (67.7) and U:80 (59.3); Ireland, W:73 (no data for circa 1980); Italy, average of W:69 (46.5) and W:77 (43.9); Japan, average of W:69 (41.0) and W:79 (37.5); Mexico, average of W:69 (64.0) and W:77 (57.7); Netherlands, average of W:67 (42.9) and W:81 (36.2); Nicaragua, average of U:70 (60.0) and U:80 (58.0); Norway, average of W:70 (37.3) and W:82 (38.2); Panama, average of U:70 (61.2) and U:80 (60.3); Portugal, W:73-74 (no data for circa 1980); South Africa, I:65 (no data for circa 1980); Spain, average of W:74 (42.2) and W:80-81 (40.0); Sweden, average of W:72 (37.0) and W:81 (41.7); United Kingdom, average of O:72 (39.4) and W:79 (39.7); United States, average of W:72 (42.8) and W:80 (39.9).

24. This project is funded by the Andrew Mellon Foundation, the Tinker Foundation, the Howard Heinz Endowment, the University of Pittsburgh Central Research Small Grant Fund, and the Instituto de Estudios Latinoamericanos. The collaborating institutions in Central America were, for Guatemala, Asociación de Investigación y Estudios Sociales; for El Salvador, Instituto de Estudios Latinoamericanos; for Honduras, Centro de Estudio y Promoción del Desarrollo and Centro de Documentación de Honduras; for Nicaragua, Centro de Estudios Internacionales and the Escuela de Sociología, Universidad Centroamericana; for Costa Rica, Universidad de Costa Rica; and for Panama, Centro de Estudios Latinoamericanos "Justo Arosemena." Collaborating doctoral students in Political Science at the University of Pittsburgh were Ricardo Córdova (El Salvador), Anabelle Conroy (Honduras), Orlando Pérez (Panama), and Andrew Stein (Nicaragua). Collaborating faculty were John Booth, University of North Texas (Nicaragua and Guatemala), and Jon Hurwitz, University of

Pittsburgh (Costa Rica).

25. Official census definitions are of little help in defining urban areas, because they include population concentrations so low as barely to make them distinguishable from rural villages. For example, in some countries populations over twenty-five hundred are considered urban when, in fact, these places are at best no more than very small towns. We sought to narrow our definition of urban to include the areas of major population agglomeration. In Guatemala, this meant Guatemala City, Esquintla, Quezaltenango, and other major concentrations. In El Salvador, it meant greater metropolitan San Salvador, including the city of San Salvador (divided into 14 zones) and the eight surrounding municipios: Soyapango, Cuscatancingo, Ciudad Delgado, Mejicanos, Nueva San Salvador, San Marcos, Ilopango, and Antiguo Cuscatlán. In Honduras, it meant the nation's two large metropolitan areas, Tegucigalpa (the capital) and San Pedro Sula. In Nicaragua, this definition included Managua (the capital) and the regional cities of Leon, Granada, and Masaya. In Costa Rica, the

sample covered the greater metropolitan region, incorporating San José (the nation's capital) and the provincial capitals of the meseta central (Cartago, Heredia, and Alajuela). The Panama sample was confined to the metropolitan Panama City атеа.

26. In Central America, census bureaus divide the census maps into small areas designed to be covered by a single census taker. The maps are sufficiently detailed to show all of the dwelling units. In places like Panama City, where there are a large number of apartment buildings, lists are available that show the number of dwelling units within each building. In the larger buildings this sometimes results in more than one census segment per building. In El Salvador census maps completed two years prior to the survey were available, but the census itself had not yet been taken. The maps were not of sufficient detail to show each dwelling unit, but they did show the major streets and landmarks (e.g., churches) and did provide a housing count for each census segment.

ON THE IDEA OF THE MORAL ECONOMY

WILLIAM JAMES BOOTH McGill University

he moral economic school, which has flourished among anthropologists, economic historians, and classicists, has received only limited attention from political scientists. This is perplexing, since at its core is to be found an intersection of debates over rational choice theory, the character of modern and premarket societies, and the normative standing of the market—in other words, over issues of formidable importance to our discipline. I seek to correct that neglect by mapping out and critically analyzing the moral economists' conception of modernity, their critique of the economic approach to human behavior and institutions, and their attempt to formulate an Aristotelian theory of the economy. These projects, though flawed, together are more than rich enough to provide fertile ground for political scientists and philosophers. I conclude with a discussion of the moral economists' effort to develop a normative theory of the economy together with a related critique of the market.

Though familiar territory among anthropologists, economic historians, and classicists, the cluster of theories grouped under the heading moral economy is as yet largely uncharted terrain for political scientists and political philosophers. This is puzzling, for there is much to recommend them to our attention. They (1) offer a characterization of modernity—and of the transition from traditional societies to the present epoch—that meshes well with and fills out such provocative readings as Habermas on system and "lifeworld"; (2) are engaged in the controversy over the "economic approach to human behavior," over rational choice and related theories, and especially over the understanding of nonmarket societies; (3) emerge in part from the Gemeinschaft critique of modernity and offer a non-Marxist critique of the liberal valuation of market society and thereby an economic extension of the communitarian/liberal dispute; and (4) can be read as an attempt to sketch the outlines of a (loosely) Aristotelian economic theory in opposition to the rights-based arguments that at present command the horizon of normative economic theorizing.2 It is obviously not feasible on the small stage of an essay to enter into the full detail of each of these areas. I propose, therefore, to reconstruct and criticize the core elements of the moral economic approach and then develop its normative dimension more extensively. First, I sketch the ideas of the embedded and disembedded economies along their institutional, explanatory, and normative dimensions. Then I critically analyze this approach while also seeking to assess, at least provisionally, its normative heart.

THE EMBEDDED ECONOMY

The theoretical center of the moral economic approach is the defining dichotomy of the embedded economy and the disembedded, or autonomous, market. This is played out as (1) the basis of an historical account distinguishing between two grand

classes of economic regime, two ways in which the economy is integrated into society; (2) the core of a higher-order debate over the proper theoretical path to be taken in understanding market and nonmarket societies; and (3) the foundation of a critique of modernity in the light of certain properties of the preor nonmarket world and as the framework for an alternative approach to the normative valuation of economic regimes. The idea of the embedded economy is the master concept uniting these varied facets of the theory of the moral economy, and it will serve throughout as my guiding thread.

At the most basic level, the claim that premarket economies were embedded means that the human interchange with nature was "submerged" in social relations (Polanyi 1957c, 46; idem 1960, 329; idem 1968, 65). Unfolded further, this amounts to the assertion that historically the provisioning of humans—the securing of their livelihood—was located in, or integrated through, noneconomic institutions (e.g., kinship, religion, and politics). According to Evans-Pritchard's study, The Nuer, for example, Nuer economic relations "always form part of direct social relationships of a general kind" (1940, 90). The specific forms of economic integration may vary (reciprocity, redistribution, exchange), but what they have in common is that they are molded, in their ends and instruments, by noneconomic forces. Where the economy is embedded, it is Gemeinschaftthe institutions, traditions, and norms of the community—that governs it. We could put this differently by saying that before modernity, the securing of human livelihood had no separateness—no boundary line that marked it out as distinct from the enveloping society's institutions and values (Polanyi 1977, 55; see also Polanyi 1957a, 70; idem 1957b, 250; Hopkins 1957, 299). The economy is thus limited not in its substantive signification (that humans must produce and distribute the means of their livelihood) but in its independence and so in its distinctiveness and visibility as well. We can see the sum of these propositions concerning the theoretical indistinctness of the

economy—its embeddedness in direct social relations "of a general kind" and the normative gloss on those relations—in Habermas's observation that "in the nonmonetarized economic activities of archaic societies, the mechanism of exchange has so little detached itself from normative contexts that a clear separation between economic and noneconomic values is hardly possible" (1987, 163).

Consider these two illustrations of how the moral economic argument deploys the principle that before modernity much of the provisioning of human beings was embedded in noneconomic institutions and values. First the koinōnia, or community, encroached so heavily upon the lives of the ancient Greeks that "economic" phenomena such as investment, land acquisition, exchange, and trade were indissolubly ethical and political matters (Austin and Vidal-Naquet 1977, 113-14; Finley 1974, 32, 49; Polanyi 1977, 145–276). For example, the low level of productive reinvestment in Athens is explained by the demands of full-time citizenship and by the inferior status of those engaged in business; the limited market in land by the demands of community cohesiveness; and the hostile attitude toward trade by an anticosmopolitanism born of a fear for the solidarity of the community. Seemingly economic activities were not purely such but rather were infused with the demands of status, citizenship, and so on (Austin and Vidal-Naquet 1977, 9; Humphreys 1978, 137, 143-44; Polanyi 1957a, 79; Vidal-Naquet 1965, 136; Will 1954b, 17-18).4 The oikos, or household, with its noneconomic social gradations and purposes (both rooted in its sense of justice and the good) was the ideal type in the light of which the city economy was understood. The city's emporium, though something needful, was an object of suspicion and contempt, controlled and kept away from the heart of community: "Athens had need of merchants and slaves. But neither merchants nor slaves were Athens; they were an elsewhere of democracy, an elsewhere which made it possible" (Vidal-Naquet 1990, 15; see also Mossé 1983, 58–62; Vidal-Naquet 1981, 214).

Similar principles are applied by James Scott to the study of modern peasant villages. Scott's work focuses on the organization of these communities around the objective of securing the subsistence needs of their members. The peasant village is here said to be constituted so as to minimize risks to its members' (uncertain) subsistence. With that starting proposition, Scott's analysis could easily be cast as presenting the economic form of the village as a type of risk insurance, reciprocity and charity as devices useful for evening out the fluctuations of the family's food supply, and institutions such as the commons as a rational response to ecologically generated vulnerabilities (1976, 3, 6, 24, 29, 40–41). Yet Scott appears to reject this sort of material welfare explanation, opting instead for something closer to the moral economic argument. The economy of these villages, he says, is embedded in a moral universe in which justice (construed as the right to subsistence) is central, as is also the notion of a just price. It is this moral universe-

and the location of the economy within it-that accounts for "peculiar" village practices and for the performance standards imposed by the community on its wealthy members. There is, in other words, a moral expectation based on the right to subsistence that leads to redistribution within the community. The market challenges this governing right-to-subsistence ethos, together with its norms of reciprocity and charity, and in so doing brings on a revolutionary response (ibid., 4, 42, 167, 170, 176-77, 189, 192). In short, all important aspects of the village economyits use of land, patterns of redistribution, and ultimately its response to exogenous forces of changeare to be explained by reference to its being embedded in a noneconomic, moral universe of solidarity and the right to subsistence. From the moral economic vantage point, these otherwise disparate communities—the oikos and the peasant village—have in common the dominance of noneconomic norms and institutions.

I now wish to move to some of the key explanatory claims of the moral economic approach. I begin here by picking up the threads of the idea of the embedded economy. Central to that notion is the relative invisibility of the embedded economy. Invisibility means roughly that core aspects of the economy (division of labor, patterns of distribution, agent motivations and purposes) are so intermingled with noneconomic values and institutions as not to constitute a distinct theoretical sphere. More exactly, it suggests that because there are no theoretically visible boundary lines demarcating that realm from its surrounding social locus, "to speak of 'the economy' of a primitive society is an exercise in unreality. Structurally, 'the economy' does not exist. Rather than a distinct and specialized organization, the 'economy' is something that generalized social groups and relations, notably kinship groups and relations do" (Sahlins 1972, 76, emphasis original; see also Finley 1974, 49; Polanyi 1957a, 71; idem 1977, 44, 55; Vidal-Naquet 1965, 136; idem 1981, 211-221). What we take to be an economic category is there "charged with a plurality of unquantifiable, incommensurable functions, among which the economic function is never isolated and constituted as such"; consequently, it has a determination that "escapes the realm of the economy" and so cannot constitute a part of an economic discourse (Bourdieu 1979, 43; Tribe 1978, 33–36).

Thus when Socrates discusses oikonomikē (household management, or economics) with Ischomachos (in Xenophon's Oeconomicus), they converse about matters such as shirking and discipline, but in a manner that makes them inseparable from ethical questions of the good life, from gender-based divisions, and from a concern with rulership and politics. The concept of the division of labor provides a good illustration of this. To be sure, labor in the ancient economy was divided, its tasks distributed, but the principles and purposes governing that allocation indicate (to the moral economist) that it cannot be considered as an "economizing" practice. Principles dictating the allocation of function typically included

gender (e.g., the norm of *erga gunaikōn*, or women's work) and citizenship status, and its purpose was likely to be the creation of something more beautiful or the preservation of the appropriate order of the human community, household or city, rather than the production of more things or of things more cheaply—as in the division of labor in Adam Smith's pin factory (Finley 1982, 186–87; Hodges 1970, 216; Vernant 1969, 211) It is the institutional and value-embeddedness of the economy—the fact that it is lost in the totality of social phenomena—that renders it theoretically indistinct.

This (not, as Schumpeter maintained, the primitive and pretheoretical cast of ancient economics) explains the remarkable ethical-political quality of those writings. It invites the most basic questions of cultural interpretation: How are we to interrogate these societies about our word-concept the economy, which would scarcely be translatable into their idiom. Thus arises the debate with rational choice and similar approaches, for the moral economists hold that the cluster of concepts that together constitute the groundwork of modern economic theory are radically distorting when applied outside of market societies. Such applications, it is said, will produce a picture of institutions and behavior that is profoundly false, transforming persons into homo oeconomicus on the market model and their society into a prop for that economy (as it is in our age). What is in fact invisible will be given the illusory appearance of visibility: we will think we see in ancient Greece or in the peasant villages of the developing world something called the economy, with suitably motivated actors and with the institutions that sustain their activities. The moral economist's claim, then, is that modern economic theory, born of market society, cannot be used to analyze nonmarket communities (Dalton 1961, 1, 7; Polanyi 1966, xviii; idem 1977, 19-20). The reasons given are various but of a common stock. Scott, for example, argues that approaches that are too materialistic and individualistic, focusing on peasant budgets and goals, miss the vital component of the village economy, which is its moral vision, its sense of justice, its sense of subsistence rights, obligations to charity, and so forth. And analysts concerned with the ancient world maintain that economic concepts are singularly ill suited to understanding economic life in classical Greece because of the "heavy encroachment" there of the political with the resulting absence of an autonomous economic sphere (Finley 1965, 33; Scott 1976, 165-67, 188-89; Will 1954a, 209).

Polanyi, Sahlins, and others push these claims one step further: in so far as economic theory (and the economic approach to human behavior) rests on assumptions of economizing behavior—of scarcity-driven optimizing choices—it is for that reason, too, the product of our society, faithfully mirroring it but causing us to see nonmarket societies as if in a camera obscura (Bourdieu 1979, 1–7; Sahlins 1972, 2–39; Dalton 1961, 7; Pearson 1957, 320; Polanyi 1957b, 243–44; idem 1977). This amounts to the assertion that scarcity, surplus, and the economizing rationality that

they are said to induce, the "formal" idea of the economy (and other social phenomena), are not universals but historically and culturally bounded. The range of formal theory is thereby limited to one era, the one that first gave rise to it. In other times, there may have been no conception of available choice among means, the logic of maximizing calculation may have been displaced by the demands of solidarity, or the definition of the human condition as one marked by scarcity and the endless growth of needs may have been explicitly rejected (as it was by Aristotle and is, according to Sahlins [1972, 2, 13, 37], in the "original affluent" societies). Surplus, scarcity, and economizing choices are useful analytical tools only for societies that name them as such, where they can constitute an economic discourse and that, the moral economists tell us, has not been the case for much of human history (ibid. 2, 13, 37; see also Polanyi 1957b, 243; idem 1977, 29-30). What they call the "substantive" economy-human beings provisioning themselves in an ongoing interchange with nature—converges with the "formal" conception of society and economy only in modernity.

So far, we have seen the idea of the moral, or embedded, economy as it plays out along two dimensions; institutional and explanatory. Now I also observed that the moral economic argument has a third, normative, side. Indeed, the very appellation under which this group of writings is gathered points directly to that ethical dimension. Reserving a full discussion of these facets, I shall for now simply mention some of the normatively oriented properties that these authors attribute to nonmarket societies. Once more the idea of the embedded economy will provide us the guiding thread, and following Polanyi, I shall privilege its (Aristotelian) "householding" variant: "[Aristotle's] famous distinction of householding proper and money-making . . . was probably the most prophetic pointer ever made in the realm of the social sciences. . . . In denouncing the principle of production for gain 'as not natural to man', as boundless and limitless, Aristotle was, in effect, aiming at the crucial point, namely the divorcedness of a separate economic motive from the social relations in which these limitations inhere" (Polanyi 1957c, 53-54). What draws the moral economist to this idea of the household is already suggestive of a normative and critical intent, for the household is seen as a nonmarket community, antiacquisitive, the "highest form of economic sociability," in which "man [is] the end of production" (Sahlins 1972, 76, 84, 86, 94; see also MacIntyre 1984, 227).

One ready way to construe that valuation is that in the embedded economy, the production and distribution of the means of human livelihood are subordinated to the pursuit of the good life broadly understood, a subordination that expresses the economy's governed character. The invisibility of the economy and of its characteristic ends is an index of this governance and of the extent to which these other goals dominate. The latter goals might include Aristotle's notion of the good life, the possibility of which

presupposes the containment of provisioning activity; the bonds of community against the atomism of market society; Scott's moral universe of the peasant village's subsistence rights and corresponding sense of justice; Thompson's related observations on the English crowd; and altruism and gift economies (Mauss 1967, 66; Polanyi 1957a, 71; idem 1977, xlvii; Scott 1976, 5, 13, 33, 42, 167, 176-77, 189; Thompson 1971; Titmuss 1971). What unites them is the thesis that these humane attributes are a function of the subordination (embeddedness) of the economy in premarket societies. This estimation is sometimes qualified, as in Scott's warning against idealizing village practices and Polanyi's observations on gender-based divisions of labor and the importance of status in premodern communities. Even with these reservations, however, there is no mistaking the conclusion that for the moral economists, the move from Gemeinschaft to Gesellschaft entailed a loss of a certain vital human quality that typified earlier societies. As Evans-Pritchard observes, Mauss and others are telling us "how much we have lost, whatever we may have otherwise gained, by the substitution of a rational economic system for a system in which the exchange of goods was not a mechanical but a moral transaction" (Evans-Pritchard 1967, ix).

THE WORLD OF THE MARKET

Central to the moral economic account is that the transition from the embedded economy to market society marked a radical watershed in human history: "[We] go into Gesellschaft as into a foreign place." (Tönnies 1979, 4). Polanyi argues that nothing comparable to market society has ever before been witnessed. Of course, markets predate modernity, but for the most part, they were marginal, often heavily administered. In domestic markets, we still find the dominance of nonmarket institutions and relations. Thus exchanges within the community are governed by the same "general social relationships" that mold that association as a whole: the exchangers are not equal, commodity-owning ciphers but members of a particular household, male or female, young or old, and so on, with each attribute carrying a social meaning that bears upon all their transactions. Markets did not integrate society or even that part of it taken up with provisioning human beings (Dalton 1961, 9; Polanyi 1977, 7; see also Evans-Pritchard 1940, 91).6

Till now we have discussed only the embedded economy. In the following pages, I want to move into some of the institutional, explanatory, and normative detail of the "great transformation" that modernity is said to have wrought. At the core of this idea of a watershed change are two related claims: (1) that in modernity, the economy is disembedded, that is, it is an autonomous sphere governed by laws of its own and (2) that the disembedded economy presses outward, tending to become integrative not only of those domains concerned with our livelihood but of society

as a whole. The first of these ideas is the institutional thesis, fundamental for the moral economists, of the autonomous, "self-regulating" character of markets in modernity (Hopkins 1957, 299; Polanyi 1957a, 68; Polanyi 1957c, 41, 71; Polanyi 1977, 10, 47). That, they argue, is the most striking feature of modern markets—and so it must appear, given their background theory of the embedded economy. For the first time in human history, the economy is not located in the enveloping and determining noneconomic context of the *oikos*, the city, the royal household, and so on. Institutionalized in the self-regulating market, it breaks free from the embrace of the sovereign community, becoming autonomous and therefore purely economic.

The second component of the idea of the disembedded economy is that of the market as pervasive. We saw that the moral economist holds that earlier societies were integrated through noneconomic institutions. Characteristic of modernity on the other hand is that the market threatens to become the dominant mechanism integrating the entirety of society (Polanyi 1957c, 57, 69; idem 1966, xvi; idem 1977, 9). The magnitude of the market's reach can be measured by the extent of commodification, by the range of goods subject to commercial traffic. In particular, the case for the pervasiveness of the market in modernity rests on the commodification of land and labor. When nature and persons, the world and human activity, are made into objects of sale—when that is the dominant mode for their transaction—the remaining barriers to marketization must be frail indeed. The former world is turned inside out, and now a whole society becomes embedded in the self-regulating mechanism of its own economy; the economy envelops society, refashioning its ethos and relations after its own image.

Unlike its predecessors, the disembedded economy is theoretically visible. Thus with modernity was born the concept of the economy (Polanyi 1977, 6). Before our age there was no "separateness" to much of the economy, no condition of existing apart from politics or other noneconomic institutions. Consequently, it could have no separate phenomenology. With the emergence of the disembedded economy as an autonomous sphere and with institutions, motives, and laws that are specifically economic, a lawlike and independent science of the economy construed as the "allocation of material goods to satisfy material wants" becomes possible for the first time (Jonas 1958; Polanyi 1977, 12, 47). But something else happens as well, for with market society comes the possibility of economics extending its explanatory range beyond the economy as just defined. Drawing on the "basic analytical tools" of rational maximizing behavior, markets, and prices, an economic approach to the whole of human behavior becomes feasible, one that makes visible the "implicit economic structure" of even such seemingly affectional communities as the family: monogamy is understood as "the most efficient marital form," and children as commodities 'presumed to have modest price elasticities because

they do not have close substitutes" (see Becker 1974, 300–301, 305; idem 1981, 106; idem 1976, 5–8, 14; Coase 1978, 207–8; idem 1988, 1–3; Posner 1983, 1, 3, 5).

With society embedded in the self-regulating market, economic society and homo oeconomicus are not distorting overlays but rather the most adequate expression of modernity. In a mirror image of the premodern world, the economy, wrenched from its (former) embedded location, merges once again with society, now not because of its saturation by the noneconomic norms and institutions of the community but as a result of its very pervasiveness, a condition captured in the phrase "market society." Assumptions concerning the pursuit of material gain, calculation, and a certain atomism or selfishness are privileged by this approach—and rightly so, for market society does generate ever new wants, giving the impression that there never can be a state of sufficiency, and induces economizing behavior of just the sort depicted in formal theory. But the formal or economic approach goes further, on this account of it, and argues that in all times and places human beings face and act on the basis of scarcity constraints that engender economizing behavior (Dalton 1961, 4-5; Pearson 1957, 320, 330; Polanyi 1957b, 244; idem 1968, 64; idem 1977, 19-25). The pretension that these concepts are of universal applicability is, as we shall see, a major part of what the moral economist faults it for. Here-but here alone-that approach has explanatory power.

The moral economist's reflection on modernity has its institutional and theoretical dimensions, but it is powerfully motivated by evaluative issues as well. What Evans-Pritchard says of Mauss speaks also for the approach as a whole: "[He] is asking himself not only how we can understand these archaic institutions but also how an understanding of them helps us the better to understand our own, and perhaps to improve them" (1967, ix). What sort of society, the moral economist asks, would be amenable to such an explanation? A society in which the economy but not the community is self-regulating; in which contract becomes the cement of an atomized world; in which no ends other than (market) economic ones are pursued. Once more, the key notion is the disembedded economy, understood in the first instance as self-regulating and therefore purely economic. When the moral economists assert that the modern market is self-regulating and all-embracing, they mean, among other things, that it has escaped the control of the community. That opening move in the moral economist's normative argument can branch out along an array of critical avenues, including: (1) a quasi-Marxian critique of the autonomy of the market as a source of unfreedom; (2) a Gemeinschaft-type, communitarian sense of the loss of solidarity in market society and its replacement by an economically generated atomism; (3) a critique based on the idea of the good and its radical displacement in market modernity. Let me say a few words about each of these.

Critique 1. We saw that the notion of the self-regulating market was central both to the moral economist's description of the characteristic institutional arrangements of modernity and to the claim that only in our era is a lawlike account of strictly economic phenomena possible. More radically still, market society makes the entirety of human behaviors and institutions available to the economic approach. In earlier times, the economy was an instrument of society's purposes—the subsistence of its members or the possibility of a good life. It was a tool and, like all tools, subordinate to its users' ends. Today, conversely, it is the economy and its self-generated ends that govern and with a power such as to transform society's order and purposes and to substitute for them the logic of calculation and maximization. Not only is it extraordinarily thorough in dissolving the traditional community and its bonds, but its sway is so great that it reaches down into even the micro level, inducing choices and behavior consistent with its ends. Never has an economic system compelled individuals so universally and with such necessity (Wolf 1971, 278-79; Polanyi 1957c, 73; idem 1968, 62-63). The market, in short, extends the reach of the economy in controlling individuals, and that in turn is made possible by its disembedded, self-regulating quality. One measure of this transformation is the array of perverse effects attributed to the pervasive market, for example, effects on subsistence, labor, and the environment.8

Critique 2. There is a group of ideas broadly related to the Gemeinschaft view of modernity as the withering of community, an argument associated with the writings of, among others, Tönnies.9 Here the critical anchor is the concept of market society as "economized," as one in which the relations and goals associated with the acquisitive economy triumph over higher ends and more human bonds, for among those things that have been lost in the great transformation is the tightly woven fabric of community, the mesh of obligations and expectations that overrode self-interest and made each person a part of a greater whole, whether as a member of a household or kinship group or as a citizen. In its stead emerged an atomized society in which the interdependency of individuals was not mediated through political, social, or religious institutions but via the market and contract. The noneconomic bonds of the world before modernity were supplanted by those forged from economic self-interest, creating thereby something very much like the community of traders, the rootless, floating world of the cash nexus, so much despised in ancient societies (Mauss 1967, 63-81; Wolf 1971, xviii, 279, 282-83; on atomism and individualism, see Polanyi 1957c, 163).

Critique 3. The contrast between economic and other (presumably superior) goods is suggested by the dominant motif of the moral economic approach, that is, the juxtaposition of economized modernity and the noneconomic premodern world. Need, fear, and

The Moral Economy September 1994

acquisitiveness are the forces that here govern behavior to an extent previously unheard of: everything and everyone must be viewed as a possible object of gain or as a competitor for goods. Little room is left thereby for purposes other than those stamped in the mold of the market. The market, in other words, through its extensive presence and its capacity to structure choices, creates a situation in which pleonexia, the ancient malaise of the acquisitive soul, becomes a systemic property driving out goods other than its own. From that vantage point, the moral economic history of modernity can be read as a reaction to these perverse effects, as a struggle between the market and society's efforts to regain governance, to assert goods other than those of the self-regulating market. For the moral economist, modernity as market society is virtually from the moment of its birth a contested form, to be queried in its theoretical expression (the economic approach to human behavior) and challenged politically. The former we see in the work of the moral economists themselves and above all in their efforts to keep alive the memory of an economic order different from our own; the latter is evident in peasant rebellions against the encroaching market-rebellions sometimes seeking the preservation of the structures of traditional society and at other times venturing novel forms of the embedded economy (Wolf 1971, 282). It is also expressed in the emergence of both socialist politics and antimodern movements on the Right and in the creation of institutions that reassert society's governance over both the production and distribution of the means of its own livelihood and the consequences of the market for its other concerns. Such projects for reembedding the economy flow naturally from the picture of market society as ruled over by a disembedded, self-legislating economy coupled with the critical estimation of that society. They are the fitting terminus of a theory that offers us an account of nonmarket societies, not out of antiquarian or anthropological interest alone but as pointing to alternative ways in which the economy could be integrated into society. Perhaps because the idea of the moral economy has in our times been developed, for the most part, by anthropologists and others for whom the most pressing task was the Methodenstreit, the normative facets of their argument cannot be unfolded directly from the texts we are considering. I therefore postpone my discussion of it until the concluding section of the essay, where I draw on other writings related to this tradition.

EVALUATING THE MORAL ECONOMY

I now want to turn to an assessment of the moral economic approach, then to a reconstruction of its normative center. First, as even their critics are prepared to allow, the moral economists' most important achievements are their underscoring that markets have not always been the dominant institutional mode of economic transaction and their offering of an

alternative typology of economic regimes (Hechter 1983, 173; North 1977, 706). The challenge to the moral economic school turns around the explanation of these nonmarket forms. Polanyi, we recall, argued that these societies resist analysis in terms of scarcity and an economizing rationality, a form of analysis that must inevitably dislodge their economy from its informing social nexus. This claim faces a number of competitors and counters. One maps a theory thatwhile rejecting an anachronistic employment of theories rooted in contemporary society—nevertheless accords primacy to economic forces broadly construed in the explanation of nonmarket societies. Marxism is one such possibility, and it employs the familiar conceptual tools of technology, scarcity, classes, states, and exploitation (see North 1981, 61–63). A second approach begins with the presence, even in market society, of institutions whose internal working are not marketlike (e.g., firm, family, government). A theory that can account for that presence may also be of use in explaining entire societies organized in a similar manner. On this view, the existence of nonmarket economies, contemporary or historical, may be understood in the light of the transaction costs associated with markets. Because of enforcement, measurement, information, and other costs, markets may, under certain conditions, simply be more expensive than nonmarket regimes. This approach is also able to provide a causal story for economic regime change as a consequence of (among other things) altered costs. 10

And that points to one of the major inadequacies of the moral economic model, namely, that it has only thin theoretical resources with which to explain economic change—why economic regimes come into being and pass away. In particular, it is hard to see what non-ad hoc explanation would be used to account for the emergence of markets out of embedded economies. And while it certainly offers an explanation for the demise of the entirely unfettered market, it does not tell us the causal story behind the failures of the "invisible hand" (Godelier 1974, 1371-72; Hechter 1983, 183, 187; North 1977, 715). The moral economic approach is, in other words, oriented toward the static state and is therefore less valuable when the question is of change across time. That in turn awakens the suspicion that its account even of stable states may be inadequate, for if it is unable to explain their demise, it may well not have an adequate understanding of the sources of their stability either.

Let me pause here to focus on the extension of the transaction cost approach. This is a natural target for the moral economist, who might answer that in using the theory of the firm as our foundation, we are led to read back into the premodern world a sort of implicit market made up of just those kinds of institutions and motivations that were virtually absent from it, for the manager of the firm can be seen as driven by market-generated imperatives to regulate the internal workings of his organization in the most efficient manner. And because that behavior-inducing struc-

ture is absent in nonmarket communities, theories of the firm will give a misleading picture of the foundations of the premodern rejection of markets, making them appear more economic than they in fact were. This retort offers a useful cautionary note, telling us that we must attend to the institutional specificity of the economy and to how it is understood by those for whom it is a part of their enveloping horizon. In short, it tells us that both in its being and in the type of explanation it calls for, a firm whose command-type hierarchical arrangement is shaped by market pressures is something quite different from, for example, the redistributionist kingly households of the archaic Mediterranean world or, for that matter, a modern family.

But perhaps the moral economic argument adopts too narrow a conception of the economic and economizing, which, in turn, is the result of its attempt to deny the choice-theoretic approach access to nonmarket societies by challenging the usefulness of notions of scarcity, scarcity-induced choice, and so on. To say that market-type scarcity, surplus, and the sorts of behavior that they help to structure are largely absent before modernity is, even if accurate, not to prove the case that economizing behavior does not exist there at all or that it is not an important explanatory device for understanding those societies. The economic approach may well provide an interpretative key to such societies so long as it is attentive to their defining institutional and motivational differences (Bates 1983, 139–40). 11 Scarcity, surplus, and economizing are wrongly defined if they are restricted to their market form and if that is the barrier to understanding important institutions and behaviors in nonmarket societies as economic at their root, then what is needed is to go beyond the too-pinched conception of the economic offered by the moral economists (Hechter 1983, 165n; LeClair 1962, 1180-1185; Smelser 1959, 176–77).

Indeed, when we consider core aspects of the behaviors they put forward as illustrative of the noneconomic character of these societies, we see the extent to which they lend themselves to retranslation into the vocabulary of the economic approach. 12 Take Scott's argument that peasant villages are moral economies because their governing objective is not individual maximization of wealth but the protection of the community as a whole against a collapse of subsistence. The end is "moral" and so, presumably, inaccessible to economic reasoning. Yet if we look at Scott's analysis of these villages, it becomes apparent that many of their behaviors and institutional forms are economizing responses to a situation of severe risk in regard to subsistence goods. They may well subscribe to the proposition that justice demands that all be preserved from hunger, but it is the scarcity of means to ward off this ill that produces their economizing decisions, including their resistance to the intrusions of the market with its threatening fluctuations and unacceptable distributive outcomes. Alter those scarcity constraints (through, e.g., state-led social assistance programs), and the structure of the village becomes redundant. The village, in short, is governed by risk aversion (a stance, Scott notes, not absent from capitalist corporations), and it economizes around its principal constraints. The specification of the end is, to be sure, a matter of "moral vision," of a certain perception of justice. But given that end and the scarcity situation that confronts the village, the resulting choices are amenable to economic analysis (broadly understood), as also is the study of their unintended consequences. Scott himself seems virtually to invite this sort of retranslation, saying that "peasant economics is better understood as a special case of what standard microeconomic theory would predict" (Scott 1976, 14).¹³

Alternately, we might consider that other focal point of the moral economic argument, classical Greece. Here again, the economy and its typical behaviors are arguably quite visible: scarcity and economizing are fully in evidence, though located in a nonmarket context. To see this, we might reflect on one of the most extensive ancient discussions of labor discipline and the division of labor—that set out in Xenophon's Oeconomicus. Socrates wants to learn how Ischomachos, a wealthy estate owner, has acquired the means to be able to engage in the affairs of his city and friends. In other words, how has Ischomachos arranged it so that he is not bound down by penury or excessive need? Ischomachos is not seeking to maximize wealth without limit but rather to be leisured, to find a way to escape from economic activity altogether. Much of their discussion centers on the managerial role of the wife in the oikos economy, the need for overseers, and (in an ancient version of the principal-agent problem) the issue of how to motivate the wife and overseer to do the master's work efficiently. The Oeconomicus, then, abounds in discussions of shirking, discipline, and motivational problems within the household that would not seem out of place in a modern text, with one exception. What leads Ischomachos to reflect carefully on the internal organization of his economy, to employ his work force most efficiently, is an ethical-political conception of the good life that requires him to maximize one very scarce good—time for the sake of a life given over to free praxis. Scarcity, maximizing, choice of technique: all can be discerned in that distant conversation between Socrates and Ischomachos, and we should not be blinded to them by too cramped an understanding of the economic as identical with its market expression.14

Still, even if it seems that this issue can readily be brought to closure (as it arguably can if the moral economist's case rests solely on an excessively restrictive understanding of the economy), there nevertheless remains a concern that in this sort of translation of the idiom of the nonmarket world into our own, it may happen that "things get lost"—perhaps some very important things (Geertz 1983, 10). My tone has suggested that we could readily speak about, say, Ischomachos's maximizing rationality as expressed in the use of his wife and servants. But now turn the table and consider what Ischomachos would have

answered to a query about his oikonomike, his economic prowess. He might well have explained it as part of the "total social phenomena" of his household—tied it to his status as a citizen of this Athenian polis and to his being male and of a certain age. Were we to answer him, "No, we mean tell us about your economic skills," his response would be the same, and he would be bewildered at our pressing him to hive off whatever this "economy" is from the rest of the relations of his oikos and its place in the city. Or, still within the "total social phenomena" of his world (i.e., looking from within its ethical and political architecture), he might, like Odysseus take offence, thinking that we were calling him a trader, one of those marginal people, the metics, whose only fatherland is profit, and who therefore are the "elsewhere" of the city (Odyssey 8.158-68). Evans-Pritchard's Nuer would probably be similarly perplexed were we to speak about exchanges apart from (for example) kinship ties. The (arguably) jarring and counterintuitive quality of the account of the family as a community of traders intimates something of this loss, as (on a wider canvas) does Émile Benveniste's observation that "everything having to do with economic notions is bound up with much greater representations that call into play the ensemble of human relations, or of relations with the gods" (1969, 202).

Would Ischomachos' and the Nuer's perplexity be diminished if we were to inform them that what we meant by economic was a "science of human choice," of choices made by rational, self-interested maximizers-if, that is, we replaced the cramped concept of the economy by a more expansive, choice-theoretic approach? For we who live in a world suffused by calculation and by a rationality disposed toward a future as a realm of possibilities to be exploited, such a view of choice may come as naturally as the air we breathe. But in the moral economic account, that is a disposition "insensibly acquired . . . and taken for granted," which is peculiar to us and foreign to members of other civilizations for whom these specific ideas of the future, time, and rational calculation are largely absent (Bourdieu 1979, 4-8). What these ambiguities illustrate is that this part of the debate virtually calls out to be carried one step further—into fundamental questions of language and interpretation across cultures addressed to the proponents of the economic approach. Anthropologists, drawing on (or paralleling) Wittgenstein and Winch among others, have already traveled down much of this road. In thinking about the interpretation of the economy, about rational choice and related theories, we might well profit from their reflections—not necessarily from their conclusions, but at least in their questioning and challenges.

How does the idea of the premodern embedded economy provide a critical fulcrum against market society? As important as the normative valuation of nonmarket societies is to the moral economic argument, it is very difficult to get a purchase on it, because, as I have said, it is even more thinly developed in this literature than is the basis of their re-

pudiation of market society. A promising starting point, however, is the idea of embeddedness. This notion contains a normative clause grounded in the claim that in nonmarket societies it is the community that absorbs the economy—directs it or infuses it with its values—rather than, as in modernity, being ruled by it. When we unfold the notion of the economy embedded in or under the governance of the community, what we find is the "domination moment" as central to the community and the encroachment of status and other forms of hierarchical gradation upon society and economy (Brunner 1956, 43-44; Finley 1974, 49). These aspects are not mere scarifications on an otherwise noble edifice but are crucial to the workings of many of those communities and to the shape of the economy within them. While similar properties have been observed in some peasant communities (see Bates and Curry 1992; Popkin 1979, 28, 61), I shall focus here on the concept of embeddedness in ancient Greek society.

We might begin by observing that the oikos, or household economy, literature was, at its birth in classical Greece, bound up with a critique of both markets and democracy for their indifference to the rank ordering of persons and of the goods that ought to be pursued (Humphreys 1983, 12). By contrast, the embedded economy was located in the koinonia—in its affective bonds, in its proportional equality (hierarchy)—and was subject to its ruling ends. In this world, the economy did not disrupt the rank order of human beings but rewarded each according to his worth. Persons there are not the ciphers they will become in markets but individuals whose different worth shapes exchanges between them (Finley 1974, 34; Godelier 1986, 231). Embedded also means, in this context, that each does what is proper to his or her status-male and female, freeman and slave, adult and child. And it signified the tight solidarity of the community against the universalism of commerce (see, e.g., Aristotle, Politics 1258a39-1258b8; Demosthenes, Private Orations 37.52; Lysias, Orations 22.14, 31.6-7). Finally, embedded conveyed the sense of "subordinate to the proper ends or purposes"-not the Midas or animallike passions of the many, not the "cloak of many colors" (as Plato in Republic 557c mockingly calls the diversity of goods under democratic regimes) but the pursuit of ta kala, the beautiful life made possible by detachment from provisioning activity, a detachment secured in its turn by domination over others. Both of the two defining elements of the ancient idea of the embedded economy, as located within the framework of the community and made instrumental to the pursuit of the good life, are suffused with hierarchy—the good rank-ordering of ends and persons. The location of the economy—the form of its embeddedness-would have been incomprehensible to them without that cosmos. What the moral economist calls the disembedded economy of the market was condemned (as was democracy) from the standpoint of the oikos (and the best regime) for its egalitarianism and indifference to rank order, its neglect of the best life, and its openness to something

outside of the tight bonds of the community's hierarchical solidarity.

We may suspect, then, that the moral economic reading of the embedded economy is colored by a certain romanticism (Godelier 1986, 181; on a similar temptation in communitarian political philosophy, see Kymlicka 1991, 85-90; Humphreys 1978, 38). Were this simply, in Habermas' wonderful turn of phrase, "the melancholy charm of irretrievable pasts and the radiance of nostalgic remembrance of what had been sacrificed to modernization" (1987, 329), then the moral economists' starry-eyed appreciation of the world before markets would be less troubling. But they mean to use that world as a mirror in which we may more readily see the flaws of our own, and in the course of doing that, they abstract from its particular binding cement, from its hierarchy and domination. In other words, they seem to have put to one side their insistence on sensitivity to the historical and institutional context. Yet embeddedness is hardly intelligible apart from that context, and once it is extracted from its specificity it loses much of its conceptual substance, becoming an ill-defined, if seductive, perception of a "thick" community. And as a countermodel to the market, that world sheds its lustre the moment its mode of embeddedness is unpacked. By leaving unsaid how the economy was subordinated and contained, this approach also causes us to miss something crucial about the theory of market society, namely the extent to which it too is a moral economics, developed in response to the embedded premodern household model.15 I now want to examine critically the notion of the disembedded market and its normative implications.

As we saw, the governing juxtaposition of the moral economic argument—the embedded economy as opposed to the self-regulating juggernaut market—also yields a picture of market society ruled over by its disembedded economic institutions. There is, however, something misleading and false in this account—at least as misleading as its corollary claim that there is no recognizable economic behavior in premarket societies, for surely the market is embedded in both significations of that term: institutional and normative. The institutional context is evident and I shall not dwell on it here. It consists, among other things, of a mesh of property rights made operative in the form of law, of contracts and their enforcement and so on. The market, in other words, flourishes only amidst an array of "external" institutional supports. 16 When it is said that markets are institutionally disembedded, therefore, it is unclear what precisely is meant-except, perhaps, that they are not (wholly) regulated from above, as if by a very visible hand. That last way of speaking of their embeddedness permits us to see their ethical locale, for it suggests that we can think of markets as being one institutional outcome of the normative shift from status to contract. I shall develop that thought in order to suggest how the embedded/disembedded language may easily be seen as misconstruing the normative character of modernity.

The mode of producing and distributing the means for human sustenance embodied in the market is expressive not of a human propensity to truck, trade, and barter or of the desire to acquire ever more things but rather of a moral redrawing of the community and of the place of the economy within it. What that transition yields is a new form of moral embeddedness for the economy. The attributes claimed for it are familiar: an economy whose actors are considered equals and a system indifferent to their noneconomic attributes; a contractarian, voluntaristic institutional context for exchanges; and the view that the public authority should not decide among preferences—that one is entitled to live one's life "from the inside," selecting and ordering one's preferences according to the good as one understands it and seeking to engage the voluntary cooperation of others in one's pursuit of them. At its foundation, this redrawing involves a shift away from the patriarchal household model, with its hierarchal and unfree core. To say that the "world we lost" was characterized by the subordination of the economy to the noneconomic values and norms of the community whereas market society has freed the economy from those moorings is to misrepresent the meaning of modernity, a meaning that has to be located in no small measure in a rejection of the household model in the economic sphere and its close analogues at the political level and in an attempt to fashion a new community and economy. 17

Consider, as an application of this argument, that in market society, labor and land have been made into commodities, a proposition that is intended to show the degree to which the self-regulating market has taken hold of-and economized-society, even down to the level of such "fictitious" commodities as nature and human activity. A more natural construction of this process of "commodification" is that land and labor are removed from their status-determined, nonconsensual location in the social hierarchy. Land is freed from its attachment to patrimonial lineage, with (as Tocqueville observed) the resulting democratization of the agrarian economy. Labor is taken from its servile status (determined by gender and other ascriptive factors) and made a part of the self-ownership of the person, something to be freely disposed of. Viewed in that light, it is once again inaccurate to characterize the "great transformation" as one from a society in which noneconomic, human values ruled to a modern order in which the primary determinants are the all-embracing and purely economic laws of the juggernaut market. There was indeed a great transformation, but it might be better expressed as a move from a community and its economy (heavily encroached upon by hierarchy and status) to a society in which a certain equality and autonomy were accorded primacy.

A similarly contestable reading is at work in the way the embedded/disembedded distinction is used to weave the moral history of modernity as the battle between the self-regulating juggernaut market and a society trying to impose a certain humaneness upon it. A less tendentious reading is that voluntary (con-

tractual) relations among persons, whether in economic or other matters, represent a central good in liberal market society and that therefore any interdiction of what is voluntarily agreed to among persons must be taken, in the first instance, as a prima facie evil. However, this is not to say that voluntary agreements are the only good to be secured, at whatever cost to other values society may wish to advance. It is to assert, however, that the interdiction of freely made agreements must be understood as a normative loss and weighed accordingly against the expected benefits. The many ways in which society now regulates contracts and markets represent not a reembedding of a purely economic sphere but the seeking of a balance among competing goods, one of which is the importance attached to the market as a forum composed of voluntary contracts that can, despite their importance, also on occasion be restricted so as allow for other goods to be realized. We could say then that what the moral economists call the reembedding of the economy is better explained as the workings of a society possessing a plurality of goods. In Michael Walzer's terms, the market is one sphere of justice, and when its operations "abut" on different spheres with other principles of justice, society may decide to limit its effects by regulating it in various ways (Walzer 1983). The embedded/disembedded conceptual framework obscures the character of market society by simultaneously understating the presence of recognizable and distinct economic behavior in archaic societies and insisting on too radical a detachment of the modern economy from its sustaining institutional and normative nexus.18

THE MORAL THEORY OF THE EMBEDDED ECONOMY

Here is roughly where we stand: the moral economists are committed to a theory of the radical exceptionalism of market society, a view that entails (so they maintain) that the mode of explanation of modernity must be similarly novel. Some are also given to the use of premodern (householding) models—the classical Greek especially (half of Polanyi's last major work, The Livelihood of Man, is devoted to ancient Greece)—as part of a critical apparatus employed against the world of the market. For reasons already suggested, I take the latter to be largely unsustainable in the late twentieth century; the former is a valuable invitation to further exploration of the issues surrounding the interpretation of economic forms. While acknowledging the difficulties to which the foundational embedded/disembedded contrast gives rise, what I wish to pursue further is the claim that far from being unserviceable, this approach suggests a powerful (and debatable) way of thinking normatively about the economy.

At the center of this part of the reconstruction of the moral economic argument is the idea of the embedded economy, and while, as I just said, that

idea is not uniquely specified by the particular structure of the classical Greek oikos, the latter is nevertheless a good starting point. Because in linking oikos and oikonomikē, "household" and "economics," it intimates another understanding of the economy as located in the mesh of family (or community) relations and purposes. 19 We can approach this idea by unfolding it into the two parts of the meaning of Aristotle's idea of the economy en tais koinōniais, "in the framework of the community." The first suggests that the provisioning of human beings is embedded or submerged in a nexus of relations—relations of justice, if you will. For example, on certain holidays, members of families give gifts to one another, and those exchanges are embedded in the framework of their community—their religious beliefs, their norms of deference and of reciprocal obligation between parents and children and so forth. By the same token, in a political community of equals who prize freedom above all, relations of distribution and of production will adapt to that overarching pattern. So, likewise, in a society that recognizes deep inequalities among its members, the economy will most probably take on yet another form. The economy, in short, is suffused by the norms of the community of which it is a part, and we would expect that where divergence occurs either economic relations will be refashioned so as to bring them into harmony with the community or the latter's values will, in a process of reflective equilibrium, undergo change. In this sense, and contrary to Polanyi-type arguments, all economies, including the near-topervasive-market economies, are moral economies, embedded in the (ethical) framework of their communities.

A second (and related) way of unpacking the concept of the economy en tais koinoniais is as a part of the view that all communities aim at some good, the perception of which informs the life of that association in its many and varies aspects (Aristotle, Politics 1252a1-5). We have just seen one manner of speaking about that claim, and the language of aiming or "being directed to" suggests another. From that perspective, the economy is understood as instrumental to the good, and that claim marks the beginning of a teleological inquiry about the good and about the place of the economy in relation to it. Here is a schematic version of this aspect of the classical theory as it proceeds from the starting point of the household. Wealth is an instrument or tool: Aristotle speaks of "wealth . . . and instruments generally" and again of property as "tools for the purpose of life," and Xenophon has Socrates discuss "the instrument wealth" (organa chrēmata; see Xenophon, Oeconomicus 2.13; Aristotle, Nicomachean Ethics 1987a28; idem, Politics 1253b31-32). Like all instruments, it has an end or purpose external to itself and in light of which its worth is judged. Wealth not governed by such ends does not constitute a good for human beings, because it has lost its telos-directed nature. Instead, it becomes a dead weight, a thing to be borne but that does not serve its proper end; or worse, it causes that peculiar corruption of the soul, pleonexia, the unlimited desire for things, a Midas-like passion that (as was the case with Midas himself) deprives those whom it afflicts of the ability to use properly the things they have.

So knowledge of the purpose that wealth ought to serve is essential to its character as an instrument in the service of the good—essential, in other words, to its being wealth at all. We do not recognize wealth as wealth (much less know how to organize and deploy it) before we have answered the query what end it serves-and not what derivative ends but, rather, what highest end for the person or the community. A plow is an instrument, and the slave is a "living tool" in the service of the oikos master, as also are his wife and overseers (Aristotle, Nicomachean ethics 1161b3-5; idem Politics 1253b24-54a8, 1255b30-40; Xenophon, Oeconomicus vii. 10-17, xii.12-20). They create material things for him (food, clothes, etc.) and by carrying the burden of direct production and supervision allow him time for higher activities. Yet none of these are wealth (at least not yet), for they await an answer to the question of how they are to be used, of the final good in relation to which they are but so many instruments. The person who is truly a good economist, who possesses oikonomikē, is the one who can answer that question. It surprises us perhaps, but not them, that Socrates, poor, pale, and shoeless, should lead Xenophon's discussion of economics; for he was, after all, "the chief of helpers in the quest of virtue" (Xenophon, Memorabilia 4.8.11).

Any human community—the household or the city-has thus to ask itself this primordial question concerning the location of the economy in its hierarchy of goods. Not to subordinate the economy to those rank-ordered goods is, in a basic sense, to render the community incoherent from the point of view of justice—to cause perverse distributions of things and to allow wealth itself to become the chief good. Classical Greek philosophers saw this subordination as directed to the master's leisure and praxis and those in turn to the possibility of philosophic or citizen activity. The classical city, for its part, intervened in the economy for the sake of securing food supplies but also to allow for the participation of poor citizens in democratic institutions.21 In both cases, the embedded economy could be seen as the practical conclusion to an inquiry concerning the end or purpose of economic activity. Economics as the science of wealth-its acquisition and employment-must be guided by the question of wealth's purpose or render itself radically incomplete. It presupposes another science, a moral or political one, just as the object of its study, the specific institutional form of the economy, presupposes our common answer to the question, "To what end?"

The answers ventured by the ancients to this question, a rentier life for the *oikos* master and for the city, are now museum pieces, valuable primarily as a warning against romanticism. However, as I have just suggested, it is possible to tease out of those arguments the materials for an alternative framework

within which to think about the economy. Because that framework makes economics—unavoidably and at the outset—an ethical inquiry, it is a worthwhile antidote to what Amartya Sen has called the "engineering" approach to economics, an approach that seems at times almost to revel in its nonethical character (Sen 1987, 2). For this framework points to two related paths, reflecting the dual types of inquiry that emerged from our analysis of en tais koinoniais. In the first place, it says that economic science is incomplete if it does not embed its studies in an overarching account of the location of the economy in the wider architecture of the community, of which the economy is simply one moment. Second, it tells us that this overarching account must be centrally informed by the question of the good to which the economy and its sustaining institutional nexus are, or ought to be, subordinate. In so doing, it directs us beyond the language of rights, self-ownership, and in general the liberal way of framing the normative study of the economy, for the question "To what end?" leads us to see the limits of a theory grounded in exclusionary rights and neutrality, a theory that (from the standpoint of the moral economy) neglects the most basic of queries as to what good is served by the economy. Taken in its entirety, this theory insists on the study of the community and its institutions grounded in the ethos that invests them with their life and form as central to an adequate and complete account of the economy. It insists, in other words, on the economy as something that we do, that involves us in certain patterns of relations with our fellow human beings and with nature, and for a purpose or end. The question "What good is thereby served?" is essential to understanding what we do when we do the things called economic—much more essential than grasping the most efficient way of doing them.

I said that the institutional and teleological senses of en tais koinōniais are related, and that relationship is evident in what we have just discussed. The end the good aimed at-informs the institutional structure of the community, including the character and location of the economy within it. But the householdmodel teleological theory that we have been considering does not simply want to map out a (normative) form of explanation. Its interrogative path defined by the question "For what purpose?" and emphasizing the instrumentality of wealth in the light of that question was meant precisely to call into doubt the market and democracy as forms for the economic and political integration of the community and to challenge them as ways of life (see Booth 1994; Humphreys 1983, 12). We have already spoken of one dimension of this. The good oikos represented a regulated economy, hierarchically organized according to the respective worth (proportional equality) of its members, husband, wife, children, free servants, and slaves and subordinated to a sovereign good. The world of the emporium by contrast was anarchical, indifferent to the community and its order, and bound together by the pursuit of money alone. Democracy, like the market, is blind to the necessary

The Moral Economy September 1994

closedness of community (Plato, Republic 563a) and to all but a narrow and partial facet of the good.

We can generalize this still further by observing again that that type of inquiry was intended to display the (related) limits of the market and democracy. This it does by driving the question of the good towards a telos, a ruling good (or goods).²² Whether by the dramatic and ascending path of Socratic dialogue or in the more mundane Aristotelian variant, conceptions of the good are challenged and undermined until that terminus is attained. Their thrust is to show that not all goods (or lives) are equal and that a failure to perceive and to be governed by the highest possible good produces a radical deficiency. Neutrality and an egalitarian pluralism are the hallmarks of that deficiency, yet they are institutionally enshrined as the virtues of the market and democracy. This, in brief, is how the critique of them in its classical form is worked through. Democracy, like money, tends to make all things alike, for both are in their different ways egalitarian and thus oblivious of ranked distinction-the one to the worth of the person, the other to the use value of the thing for the attaining of the human telos. One result is that unequal things and persons are rendered (conventionally) equal by democratic citizenship and money respectively (Aristotle, Nicomachean Ethics 1131a25-33, 1133a20-23; idem, Politics 1280a8-17, 1281a-8, 1317b4-9; Plato, Republic 558c). Mirrored in the lives we lead as members of a democracy (and presumably of the emporium), our characters become, Aristotle writes, like masterless (adespotois) households in which one can do whatever one wants (Nicomachean Ethics 1161a8–9; Politics 1317b10; see also Plato, Republic 557b). One does as he wishes because the idea of a sovereign good (the master) is absent and in its absence all desires and pleasures, all life plans, are treated and honored equally. In other words, this equality and indifference as among persons and ways of life is possible where, in Plato's words, "the acropolis [of the soul is] empty" (Republic 560b, 561bc). For Aristotle as for Plato, that is an empty soul and city, a failed life and an inferior community, and its root cause is that the question of the telos, of the good life for citizen and human being, has been neglected. The "cloak of many colors," the celebration of the multiplicity and diversity of lives and ends, is testimony to the incompleteness of these institutions (and souls), evidence that they have not only not come to the end of the interrogative path "For what purpose?" but that they have lost sight of it altogether.

Here then is the nub of the dilemma for contemporary moral economists who wish to travel down that path. There is an answer to the question, "For what end is the economy in this specific, market, form?" The answer might be expressed, "So that within this sphere I may do with my things, my labor, and so on as I wish, consistent with a recognition of the right of others to do likewise; in short, so that as far as is possible under conditions of interdependency, I may lead my life 'from the inside'." Such an answer, when completely developed, is very likely

to issue in some variant of a theory of institutional neutrality among those life plans rooted in, for example, liberal conversational constraints that rule out attempts to legitimate power through claims to a knowledge of the good or to a personal superiority, in the idea of a modus vivendi in the face of moral heterogeneity or in the notion of an overlapping consensus (see, e.g., Ackerman 1980, 8–12; Larmore 1987, 129–30; Rawls 1993). If the moral economist allows the interrogative path to end there, what she has accepted is (arguably) a more reflective form of liberalism—guided by the question of the good rather than by a theory of rights alone, but a liberalism nonetheless.

If, however, she follows that road as far it was meant to be followed and as far as its internal logic suggests it ought to be, pluralism (the "cloak of many colors") and neutrality or an overlapping consensus in place of a comprehensive and sovereign good (the "empty acropolis") will not be satisfactory. What then presses onto the philosophical stage is (something very much like) a theory of the good as over against the shadow world of the market and democracy, the world structured so as to allow for a plurality of life-plans lived from the inside (see Rawls 1993, 134-135, 146n). In other words, because neutrality among competing life plans is (from this standpoint) at best a chimerical answer to the question of the good and of wealth and the economy as instruments in its service, the moral economist will be led beyond the threshold of liberal conversation. In brief, it is difficult to see a via media by which this part of the project can be pursued and not end up in a challenge to a social pluralism of ends and the norm of choosing one's own life plans. Yet even if that is so, there is still much to be learned from an engagement with the moral economic argument. For their writings draw us into a way of thinking about the economy that is radically at odds with both the economic approach to human behavior and institutions and with the rightsbased theorizing that has long commanded the conceptual heights of normative economics. They invite us-political scientists and philosophers-to place the economy in a larger cosmos of human goods, to see it as permeated by the norms of the enveloping society and thus to look at it in a light different from the one that we are accustomed to. That, I would suggest, makes the encounter with the moral economists worthwhile, however far we may choose to follow them along the road they marked out.

Notes

1. For recent social-scientific discussions, see Bates 1983; Bates and Curry 1992; Hechter 1983; North 1977; Popkin 1979; Scott 1976; Taylor 1993.

^{2.} The German terms Gemeinschaft and Gesellschaft, best known from Tönnies's (1979) study, resist translation into English, because our nearest equivalents, "community" and "society," are so close in meaning as to smudge just those distinctions that the German usage was meant to capture. The difficulty is not merely terminological, however, for the no-

tion, central to the moral economic argument, of a radical separation between two great epochs, their corresponding normative structures, and the theories needed to explain them is (as we shall see) questionable. Among contemporary communitarians, Alasdair MacIntyre recognizes the affinity of his own work with the moral economic school but does not develop it (1988, 211; see also MacIntyre 1984, 227-28)

- 3. Finley (1975) is critical of parts of Polanyi's project. Some of the classical historians cited in this essay (e.g., Vidal-Naquet and Will) develop arguments similar to those of the moral economists without, however, directly employing their writings; others such as Humphreys and Finley address them explicitly. Above all, many of them share with the moral economists a suspicion of the economic approach to the analysis of these societies. To the best of my knowledge, they have not engaged in the normative/critical dimensions of the moral economic project. Other classical historians are sharply critical of the moral economic school (Ste. Croix 1959-60; Veyne 1974, 1976). I shall draw on their writings to fill out points only thinly developed in the canonical "moral economy" literature, and these references should not therefore be taken as including them among the members of this school (if that designation is even appropriate for such a heterogeneous cluster of theories).
- 4. On the complexities of understanding investment in the classical Greek world, see Millet 1983.
- 5. For a canonical statement of the debate over the limits of scarcity, cf. Aristotle, Politics 1257b28 and 1323b7-10 and
- Menger 1976, 94–96, 98–99, 100–101, 289–90.
 6. To see the quite different interpretations given to the phenomenon of premodern trade, compare Mancur Olson's commentary on Herodotus' The History 4.196 describing trade between Carthage and native peoples (1992, 60-61) and Polanyi's gloss on the same passage (1968, 243; cf. 238-39, 241, 258). In general Polanyi emphasizes the administered character of premodern trade, the absence of an economic rationality, and the distinction between markets and trade. Olson's reading underscores the view that the "gains from trade are often huge" even in "the most difficult and primitive circumstances," rejects value-based explanations of the presence of markets, and suggests that the absence of a vital institutional nexus (e.g., courts and a legal system) prevents further such gains.

- 8. On subsistence, see Evans-Pritchard 1940, 84-85; Scott 1976; Thompson 1971. On labor, see Polanyi 1957c, 82-83; Thompson 1967. On the environment, see Polanyi 1957c, 73, 130; Wolf 1971, 277, 279–80.
- 9. Tönnies was wary, however, of what he took to be a romantic misappropriation of his book, one emphasizing a
- "social pessimism" about modernity.

 10. On this and related issues, see Coase 1988, 3; North 1977, 708–11, 713; idem 1981, 20–33, 42–43, 106, 181; Posner 1983, 146-173.
- 11. I develop a critique of this aspect of the moral economic argument in Booth 1993a, 76-92.

 12. On kinship groups as "insurance companies" and on
- open fields in peasant agriculture, see, e.g., Bates 1983, 7-20; Becker 1981, 238; Popkin 1979; Posner 1983, 146-173
- 13. On Scott's mode of explanation, see Booth 1993b; Taylor 1993, 109-10.
- 14. For nonmoral economic readings of the ancient economy, see Lowry 1979; Gunderson 1982; Veyne 1976, esp. 69-74 (critique of Polanyi).
- 15. For a parallel critique of communitarian political philos-
- ophy, see Homes 1993, 190–97.

 16. See Desai 1986, 8, On Marx though his comments are equally applicable to the moral economy argument. The difficulties encountered by the emerging market economies of the former Soviet bloc illustrate just how important this sustaining institutional framework is; see Clague and Rausser
- 17. A comparison of the Gemeinschaft to Gesellschaft estimation of this watershed with Maine's (1864, xl, 163) positive

valuation of the shift from status to contract is instructive in this regard.

- 18. For an explanation of the firm as an embedded institution, see Granovetter 1985, 487-504. This article is a powerful sociological critique of both the economic and embedded approaches.
 - 19. On the philological background to this, see Singer 1958.
- 20. I follow Will's suggestion and translate Aristotle's en ... tais koinōniais (Nicomachean Ethics 1132b32) by "framework of the community" (1954a, 215). Aristotle is here discussing reciprocity, but the idea clearly informs the entire economic discussion of book 5, as well as the analysis of the household in the Politics, book 1.
- 21. On food policy, see Garnsey 1988; on civic salaries, see Will 1975.
- 22. For analyses suggesting a range of goods in Aristotle, rather than a single "grand end," see Broadie 1991, 198–202; Nussbaum 1986, 352–53, 498, n. 20; Salkever 1990; Saxonhouse 1992, 185–232. Relatedly, see Yack 1985, 94, 99, 109; 1002, 207 (constitutions) idem 1993, 25–87 (community, esp. 43–50), 106 (democracy), 170–71 (political dialogue and the common good). Rawls 1993, 134-35 (and even more so MacIntyre 1984, 146-64) stress the more restrictive perfectionist reading, though needless to say with very different conclusions.

THE PIETY OF THOUGHT IN PLATO'S REPUBLIC, BOOK 1

DARRELL DOBBS Marquette University

In the opening sentence of the Republic, Socrates recounts his intention to combine the operations of piety and theoretical speculation. Nevertheless, many readers regard Cephalus' subsequent abandonment of rational inquiry to perform certain sacred rites as a definitive indication of Plato's opinion that piety and philosophy are fundamentally incompatible. I find this interpretation untenable inasmuch as it depends upon the misidentification of Cephalus as the dialogue's representative of piety. I suggest that the true nature and philosophical significance of piety are indicated instead in Socrates' conversation with Cephalus' son, Polemarchus. As this conversation unfolds, Polemarchus' pious inclinations culminate in a perception of the dearness of the unknown good. Inspired by this piety, Socrates and Polemarchus defend the conventional paragon Simonides and, at the same time, launch a truly philosophical inquiry into justice.

lato's Republic is reputed to be one among a handful of the greatest works ever written on the theme of social justice and personal happiness. Yet if we should wish to verify this judgment, and to derive the benefit of its insight for ourselves, we would confront an extraordinary challenge in the complexity and sheer size of the work. This challenge might seem to outrun every endeavor, for the better acquainted one becomes with the Republic, the more time-consuming becomes the consideration of any given section of it. The pace of successive readings tends to slow. Eventually one opens the text only to ponder at length the significance of a single phrase or dramatic event. Such a meditation can be exquisitely pleasant. But what is there to prevent so closely focused a study from losing its bearings? How might the student keep from losing sight of the forest for the trees?

It would be incongruous, to say the least, were a professional academic to deny the relevance of this dilemma to the study of Plato's Republic. For it is the achievement of synopsis (the capacity to see simultaneously both the forest and the trees) that the Republic submits as evidence of a dialectical nature and thus as testimony of one's being qualified to undertake advanced studies in the first place (537b8-c7). So it is incumbent upon every reader, when approaching this dialogue, to consider how the forester's dilemma might be resolved. Now, Socrates himself offers a key to the resolution of this dilemma in his remarks on the art of writing (Phaedrus 264c2-266c1). In a properly constructed composition, he maintains, one finds something like the integrity of a living body. Where such integrity obtains, the natural articulations or joints of a composition mark off segments that are intelligible precisely as parts of a whole. We may say, then, that the very divisions that call for detailed study also summon, at the same time, a recollection of the whole. By concentrating attention on such divisions, the student is able to think and to talk about the most minute textual details in a wholly nonreductive manner. Plato's Eleatic Stranger, expert in the art of dialectic, invites us to call such divisions *eidetic* or *ponderable* parts in order to distinguish them from the mere pieces into which any whole may be thoughtlessly—or even methodically—broken (*Statesman* 262c8–263b11).

In such passages Plato encourages the practice of dialectical analysis upon his own writings. But on what basis may we undertake the dialectical task of dividing Plato's Republic into ponderable parts? Clearly, some grasp of the dialogue as a whole is required before one can reasonably venture upon such a division. But whence comes this division-initiating understanding of the whole? Surely, it cannot originate in a concentrated study of ponderable parts, for this begs the question of which parts are correctly identified as ponderable. Neither can it derive from blind trust in the judgment of more experienced students, for this begs the question of the basis of the more experienced student's understanding. The only escape from this impasse lies in the possibility that the understanding needed to guide the division of the dialogue into ponderable parts is somehow accessible even to the novice upon an initial reading of the entire work.2 The contours of the very surface of the work might then be said to reveal its natural articulations. Leo Strauss put it well when he declared in the case of such a work that "the problem inherent in the surface of things, and only in the surface of things, is the heart of things" (1958, 13).

Plato employs his luminous poetic talent accordingly, to epitomize the profoundest themes of his philosophical compositions. One of his customary devices in this undertaking is the ethological mime, the representation of an action in which all pretense is stripped away and an interlocutor reveals himself both in character and in thought (see Klein 1965, 18). The first example of such a *mimēsis* in the *Republic* reaches a climax early in book 1, with the departure of Cephalus. The importance of Cephalus' departure is further highlighted by its conspicuous reversal of the dialogue's dramatic momentum. In the beginning, Socrates and Glaucon are together. These two are

soon joined by Polemarchus, Adeimantus, Niceratus, and some others. This ensemble then makes its way to Polemarchus' house, where await Lysias, Euthydemus, Thrasymachus, Charmantides, Cleitophon, and Cephalus, the father of Polemarchus. A conversation is presently launched concerning the nature of justice. Although this conversation continues into the early hours of the morning, not a single member of the congregation is said to depart, except for Cephalus. Cephalus abandons the inquiry in its infancy. The old man departs because, as he says, "the time is come when I must tend to the sacred things" (331d7).

Cephalus' departure surely stands as one of the most striking dramatic events in the dialogue. As such, it invites comparison with the violent eruption of Thrasymachus, who hurls himself at Socrates and Polemarchus "like a wild beast" (336b5-6). But the antagonism represented by Thrasymachus' outburst is composed in the course of the conversation. Socrates later states that he and Thrasymachus have become friends, though they were not even enemies before (498c6-d1). Cephalus' departure, on the other hand, is final. He never returns. So if even Thrasymachus (the sometime champion of might over right) can be reconciled to Socrates, it would seem that Cephalus' complete break with Socrates and the community of inquiry must portend an issue of considerable importance. Following the clue of Cephalus' parting words, we may infer that this issue somehow concerns the divergence of philosophical inquiry and attendance to "the sacred things." Cephalus' departure somehow manifests Plato's understanding of the tension that exists between the interrogatory motion characteristic of the philosophical life and the magisterial stability characteristic of revelation and fundamental law. Strauss characterizes this tension—the philosopher's "theologicopolitical predicament"—as nothing less than "the secret of the vitality of Western civilization" (1989, 270).3 Of course, one need not agree with Strauss's specific interpretation of the character of this tension to agree with his estimate of its vital importance. But any attempt to propose a different interpretation must account for precisely such testimony as is presented by Plato's rendition of the departure of Cephalus. We may begin to offer such an account by noting that Cephalus' schism constitutes the seismic epicenter of a passage bounded by the opening of the dialogue on one end and by the closing of Socrates' conversation with Polemarchus on the other. As we shall see, this passage must be considered in its entirety if we are to arrive at an accurate assessment of Plato's conception of the relationship between piety and philosophy.

THE DIVERGENCE OF PRAYERFUL REVERENCE AND SPECULATIVE SCRUTINY

Let us begin then at the beginning, for Cephalus' parting words are not the first indication in the

Republic of a concern for the relationship of piety and inquiry. In the dialogue's opening sentence, Socrates reports his own intention of combining these divergent operations. To appreciate the full significance of this remark, however, we must keep in mind that the Republic is, in form, a narrated dialogue-and a particular kind of narrated dialogue at that. Plato assigns the role of narrator in the Republic to Socrates. In this role, Socrates reports not only what he and others said and did on the preceding day but also what he thought then and what he thinks now, with the benefit of hindsight, of those words and deeds. So Plato puts Socrates forward as a uniquely authoritative commentator on the conversation reported in the Republic. Nevertheless, even in his narration Socrates leaves many things unexplained. For example, the occasion of his recapitulation of the previous day's doings is not itself described. Nor is there any indication of the existence (much less the identity) of any auditor or auditors. Socrates, to all appearances, is talking to himself. Of course, we readers are the intended audience—ultimately. But within the frame of the dialogue, Socrates addresses his rehearsal to no one but himself. The reader evidently is witness to an exercise in personal recollection, a soliloquy. 5 Now a soliloquy is a speech spoken with a level of candor not to be expected in the public discourse of a prudent man. So Socrates' narrative remarks will be more directly indicative of his own views than much of what he reports having said in direct discourse with his interlocutors, whose dispositions might on occasion be expected to skew, to some extent, his choice of words.6 We are well advised, then, to consider carefully Socrates' opening statement of purpose: "Down I went yesterday into Piraeus with Glaucon, Ariston's son, both in order to pray to the goddess and at the same time because I wanted to see in what manner they would conduct the festival, inasmuch as this was the first time they were holding it" (327a1-3).

In this narrative opening, Socrates cites a thoughtprovoking linkage between the two reasons that draw him toward Piraeus. He descends "both in order to pray . . . and at the same time because [he] wanted to see" (te . . . kai hama). It is important that we understand the significance of this linkage correctly. For some might suppose that Socrates is interested in nothing more than "killing two birds with one stone," in the sense of indulging his personal intellectual curiosity (theasasthai 327a3, theōrēsantes 327b1) while merely appearing to satisfy certain social expectations concerning his acknowledgment of the goddess. But Socrates does not say that he intended to be seen praying; what he says is that he intended to pray (proseuxomenos 327a2). Nevertheless, many readers will be inclined to maintain that any show of devotion on Socrates' part must be construed as nothing more than the window dressing required if the philosopher is to escape persecution by an intolerant, closed society.8 On this interpretation, Socrates bows not to the goddess but merely to his own theologicopolitical predicament.

This interpretation deserves to be taken seriously, for the Republic certainly presents convincing evidence that Socrates rejects many points of theology popularized by Homer and Hesiod. There is also the matter of his claim to possess a personal daimonion, which undoubtedly overshot the boundaries of Greek religious convention (albeit in the manner of evidence of Socrates' acknowledgment of the existence and the providence of the divine). But these considerations by no means preclude the possibility that Socrates finds himself obliged to the graciousness of certain other divinities, not all of which were utterly unrecognized by the customary religion (see, e.g., Phaedrus 279b8-c3, Republic 451a4-5). Indeed, other factors besides the candor of his narrative remarks corroborate the sincerity of Socrates' avowed intention to pray to "the goddess." For the goddess in question is Bendis, as seems clear from the sequel (354a10-11). Bendis is the Thracian persona of Hekate (a.k.a. Artemis), leader of souls in the underworld and goddess of crossroads (Pauly-Wissowa 1937, 3:269; Brann 1967, 111, n.4; Burkert 1985, 171; Morgan 1990, 21). Such a goddess might well be reckoned a patroness of Socratic political philosophy, for in one of the most celebrated metaphors in all the works of Plato, Socrates likens the political realm to an underground abode, a cave, which he in turn compares to Hades (514a-15a5, 516c8-e7). Socrates "goes down" into Piraeus, just as Heracles went down into Hades to perform certain labors (Brann 1967, 3-6) and as the philosopher king is later said to go down into politics (540b5-6; see Dobbs 1985, 812-21). Socrates makes this descent with Glaucon, a young man who stands at a moral crossroads. Glaucon faces a choice between justice and injustice, a choice that will determine the course of his life and the salvation of his soul (347e2-7, 352d4-6, 621b8-c2; see Dobbs 1994).

Moreover, if Bendis does represent some aspect of the true divinity (the one necessary and eternal being, recognized by philosophers of every era), Socrates' prayers to the goddess would naturally express and comport with his own acknowledgment of mankind's finitude and contingency. An appreciation of the limits of the human condition is crucial to the understanding of Socrates. Socratic wisdom is not divine wisdom. Yet Socrates also holds that human beings are capable of partaking in the heavenly spark of divine intelligence (e.g., 590c8-d6). For Socrates, then, the human condition is twofold in nature. Consequently, a pair of prerequisites must be satisfied for a human being truly to know himself: each of us must acknowledge the gulf separating himself from the divine and, at the same time, honor his own capacity for divine intelligence by developing it to its highest peak of excellence. Such self-knowledge would expose the mortification of ascetics and the pride of intellectuals as inadequate and merely piecemeal responses to the human condition. For what the human condition calls for is both reverential and intellectual endeavor, not merely severally or alternately but at the same time. So Socrates' twofold intention—both to pray and at the same time to

see—is indicative of the character of an ordinate and (I hazard to say) just response to the essential human calling. Of course, it remains to be seen whether and how far such a response is practicable.

What, then, are the prospects for the satisfactory realization of Socrates' intention? It seems evident that the operations of reason and reverence may collide. Piety is as demanding in its call for commitment as critical judgment is in its requirement for detachment. Each would appear ultimately to exclude the other. If we take into consideration the conversation occasioned by Socrates' descent into Piraeus, we find that Cephalus' abandonment of Socrates' inquiry into justice—at the very moment that inquiry appears to intrude upon his service to the divine—dramatizes this conflict and suggests the possibility that piety and rational inquiry are fundamentally incompatible. This possibility shades increasingly into a certainty as one looks upon Cephalus as the embodiment of genuine piety. If Cephalus does stand for piety, then one might well conclude that it is simply impossible for the same person to do justice to both aspects of the human condition (Strauss 1989, 269-70).

But it is by no means clear that this is Socrates' view, or Plato's. Certainly, one cannot leave unexamined the possibility that it is Socrates, rather than Cephalus, who practices genuine piety. In fact, Socrates' disclosure of intent in the narrative opening of the Republic corroborates the public testimony he offers later at his trial on the charge of impiety. In this testimony, Socrates answers the Athenians' notorious indictment by portraying his customary crossexamination of fellow citizens as a service to god. He explains, however, that this pious service involves, at the same time, a scrutinization (elexon) of the divine oracle itself (Apology 21b1-23c1). In other words, Socrates interprets his divinely sanctioned vocation as one that requires a combination of piety and rational scrutiny. 10 Plato's illumination in the Republic of the quality by virtue of which Socrates can achieve this combination will succeed, however, only if certain pretenders to the status of reverence and reasonableness are first unmasked. This, to state the matter concisely, is the guiding purpose informing his composition of Socrates' conversation with Cephalus.

THE EXPOSURE OF RATIONALISM IN CEPHALUS' FALSE PIETY

As Socrates and Glaucon head homeward from the sacred processions, they are intercepted by Polemarchus' servant. Polemarchus and Adeimantus arrive presently and prevail upon Glaucon and Socrates to go to Polemarchus' house. There Socrates meets with Polemarchus' father, Cephalus, who has just come from performing some sacred rite himself. Cephalus greets Socrates warmly. Pleading his own inability to make the journey up to the city, Cephalus urges Socrates to come to the Piraeus more frequently.

Socrates says he delights in conversing with his elders, for it permits him to inquire about the path that he, too, may have to travel one day. So he asks Cephalus, "Is it a hard time of life or what?" Cephalus' answer is heartening. This old man discounts the many complaints one ordinarily hears from old men. Their nostalgia for the faculties and pleasures of youth is especially mistaken, according to Cephalus. As against such complaints, Cephalus notes that even the tragedian Sophocles, high priest of the Dionysian celebration of eros, regards the dwindling of sexual appetite as a liberation from a raging tyrant. To mourn such a liberation is absurd. The complaints and the troubles of the aged must be blamed, then, not on old age but on bad ways (329d2-6). After all, if it were old age itself that caused such trouble, Cephalus reasons, he would suffer from such difficulties as much as the next man.

Socrates marvels at Cephalus' saying this and desires to hear more. He notes provocatively that many would be likely to dismiss Cephalus' testimony altogether; they would credit his brave words to the possession of wealth. Cephalus concedes that wealth is important, though not so important as the multitude may suppose. By way of explanation, he recounts a saying of the illustrious Themistocles. It seems that a certain "Seriphian detractor"-a man embittered by his own obscurity, which he blames on the political insignificance of his native city-once insisted that it was only thanks to Themistocles' being an Athenian that he had achieved glory. In reply, Themistocles acknowledged that if he too had been a Seriphian, he would never have become renowned; but neither would this detractor ever have become renowned, even if he had been an Athenian! Cephalus thus suggests an analogy between his own conception of great wealth and Themistocles' conception of great politics. Cephalus no more regards wealth as an assurance that one will possess the greatest good than Themistocles so regarded citizenship in a great polity. Socrates surmises that Cephalus has inherited his wealth, because he does not seem in what he is saying to be overly fond of money (330b8-c1). Those who earn their own wealth, in contrast to those who are given it, resemble parents or poets. The latter cherish their children or poems not only insofar as these are good or serviceable (kata tēn chreian) but also because they are their own (330c3-6). Socrates thus remarks on the absence in Cephalus of a vehement (sphodra) love of his own. It seems then that the Themistocles analogy may run deeper than Cephalus had intended, for, as we know, Themistocles betrayed his own country, showing himself in the end to be indifferent as between the equally serviceable political communities of Athens and Persia. Cephalus, we may say, is similarly indifferent as to the source of his wealth, provided only that it proves to be of service to him. The precise character of Cephalus' understanding of the serviceability of wealth remains, then, to be considered. So far, Cephalus has suggested that wealth is some sort of prerequisite to the enjoyment of happiness.

One wonders in what sense wealth is prerequisite to happiness. In Cephalus' case, the relationship between wealth and citizenship exceeds the analogical and approaches the literal, for as a resident alien, or metic, Cephalus is not eligible to participate in the politics of Athens. For all practical purposes, Cephalus' wealth is his country. 11 But to Socrates, who proclaims that he never left Athens except to fight in her defense and who suggestively adverts to the riches of his own ten-thousand-fold poverty, Cephalus' likening of wealth to citizenship must appear questionable. So Socrates invites Cephalus to name what it is that he takes to be the "greatest good he has enjoyed from his abundant wealth" (330d2-3). Cephalus declares that thanks to his wealth he has not been forced "to cheat or to deceive anyone, or to depart for that next place in fear, on account of owing some sacrifices to god or money to a man" (331b1-4). Of course, Cephalus stipulates that wealth does not provide this benefit for just any man but only for one who is decent and orderly (tōi epieikei kai kosmiōi). Couched in this qualification, Cephalus' evaluation of wealth might seem innocuous enough. One is almost tempted to equate it with Aristotle's appraisal of wealth as the "necessary equipment" of a happy life (Nicomachean Ethics 1101a14-16). But we must tread carefully here, for Cephalus values great wealth not as an instrument employed in the exercise of an already confirmed disposition to virtue but rather as a necessary means to confirm such a disposition in the first place. Its possession provides insulation from circumstances that Cephalus assumes will drive any man to crime. But for Aristotle it is precisely character that keeps a decent man "in character." As it happens the decency stipulated by Cephalus is not a matter of character (ēthos) in the strict sense at all. Instead, it is in his own words merely a tropos, that is, an inclination or tendency (see 329d3-4). Wealth, according to Cephalus, is the functional equivalent of

Once this has come to light, Socrates admiration for Cephalus gives way to thinly veiled irony. 12 Nevertheless, Cephalus' words and deeds continue to demonstrate that he is a man very much concerned (one might even say preoccupied) with ultimate or eschatological matters. This does not, of course, establish his piety or righteousness. On the contrary, the aged Cephalus experiences what may be described as a servile, rather than a reverential, fear of the gods. It is only due to anxiety at the prospect of retribution in the afterlife for his crimes in his present life that the anerotic Cephalus even takes notice of the gods: "Know well, Socrates, that when one is gripped by the thought that his end is near, he is possessed by fear and concern for things that never occupied him before. The stories, which he used to ridicule, about what goes on in Hades—that the man committing injustice here must pay the penalty there—now torment his soul for fear they might be (330d4-e2). (A truly erotic soul, however, would not require the prick of such anxiety to seek the divine [see, e.g., Phaedrus 248d2-249e4].) Of

course, Cephalus is uncertain whether his newfound interest in sacred matters is a function of some special perspective vouchsafed the aged by virtue of their proximity to death or is merely a function of the infirmities of old age (330d7-e5). But he does acknowledge that he finds security in assuming the worst as regards the eschatological facts of life. Cephalus compares what he has to lose if he mistakenly disregards the warnings of traditional theology with the value of the money required to carry out the customary, propitiatory oblations. He decides to sacrifice his superfluous wealth, which he takes to be all except enough to leave his heirs a little more than what his own spendthrift father left him after wasting a good portion of the family inheritance (330b6-7). In other words, Cephalus makes his gamble on the same terms as the famous wager, which, we may be assured, Pascal contrived to demonstrate the untenability of the rationalist criticism of piety, rather than to induce genuine faith (Pascal 1986, §418 and §110). Hence, Cephalus' turn to religious ceremony is hardly pious in itself; it is merely indicative of a certain talent for calculation that is pressed into the service of anxiety concerning the afterlife. It follows that Cephalus is better understood as a representative of rationalism—which holds that rational calculation suffices for the resolution of all questions of human affairs—than as the spokesman for piety. 13

Of course, there can be no question but that Cephalus embodies the mercenary tendency that the vulgarization of Orphic writings and religious practice had taken in his time (see, e.g., 363c3-365a3, 365d7e6). In this sense, one may speak with some propriety of Cephalus as representative of a decadent piety. But traditional piety in its decadence is by no means to be confused with traditional piety in its prime (see, e.g., Morgan 1990, 108-14). Hence, I suggest that Cephalus' divine service bears roughly the same relation to traditional Greek piety that Macy's Christmas parade bears to the pilgrimage of the Three Wise Men. To be sure, Cephalus' departure from the conversation indicates the incompatibility of a decadent piety with Socratic philosophy, but it in no way settles the question whether or not Socratic philosophy is at odds with uncorrupted piety. Therefore, if, as Bloom says, "Socrates must induce Cephalus to leave the scene because Cephalus is beyond reason" (1991, 312), we must add that it is not due to piety that Cephalus is beyond reason. We may grant that Cephalus leaves because he is beyond reason, but he is beyond reason only because there is something unreasonable in being a rationalist.

In the course of answering Socrates' question concerning the greatest good that derives from his possession of great wealth, Cephalus had occasion to imply that it is unjust to cheat or lie to any man or to fail to render to gods or men the sacrifices or things they are owed (331b2–3). Picking up on this suggestion, Socrates now asks whether we should pronounce "the opposite of these things, namely the truth and the rendering back of what one has received from another, to be justice or righteousness

itself; or should we say that it is just in some cases and unjust in others to do these very same things? (331c1-5). Cephalus does not respond. He has not taken the trouble to formulate definitively his understanding of righteousness, whether in relation to other human beings or to the gods. What he has is a rule of thumb. But Socrates pursues the inquiry. He proposes a thought experiment that may help Cephalus to sort out the essential from the merely accidental characteristics of acts of justice. Socrates supposes that everyone (pas 331c5) would agree that it would not be just or right to return a borrowed weapon to its owner, if the owner were to demand it in a fit of madness. Cephalus acknowledges, in response, that Socrates speaks correctly (331d1). Hence, there can be no question but that Cephalus correctly judges the force of Socrates' counterexample. The most we can say is that Cephalus fails to follow up this correct judgment with an attempt to formulate more adequately his understanding of justice itself.

Cephalus, in other words, is complacent in the face of the manifest inadequacy of the definition that Socrates has cobbled out of his rule of thumb. But this is neither irrational nor contrary to expectation. The fact of the matter is that Cephalus correctly judges the test case. (Of course, this is no great claim, since Socrates is willing to assume that it is true of everyone. We shall consider Polemarchus' taking exception with this momentarily.) In other words, Cephalus rightly perceives that the situation described by Socrates does not properly fall under the jurisdiction of his rule of thumb. But a genuine refutation would require that Socrates devise a case in which Cephalus errs either in applying or in failing to apply his rule of thumb. Socrates does not do this. Logically (but only logically), then, Socrates and Cephalus are quits. Polemarchus steps in at this point, oddly enough, to defend his father's rule of thumb as if it were a definition (horos 331d2–5). Polemarchus' initiative provides Cephalus with an opening to depart. The old man speaks of handing the argument down to the assembled company (hymin, 331d6). But Polemarchus persists in taking matters into his own hands: "Then am I not the heir of what is yours?" (ego, cf. toutoisin 330b6). Cephalus laughs at his son's enthusiasm, uttering something like, "It's all yours, such as it is" (Pany ge 331d9), as he departs to attend to the sacrifices.

The palpable contrast between Cephalus' appreciation of the force of Socrates' counterexample and his son's zeal to defend the indefensible suggests that the shortcoming of Cephalus, anyway, is hardly one of rationality. Moreover, as we have already noted, Socrates does not refute Cephalus. What Socrates does accomplish in their exchange is to reveal with perfect clarity the nature of Cephalus' temperament. This revelation is a critical step in the disclosure of Plato's understanding of the relationship of piety and philosophy, for Cephalus represents a common vulgarization and misunderstanding of piety. As long as Cephalus stands as a representative of piety, the relationship of piety and philosophy will be miscon-

strued. Plato corrects this misunderstanding through his ethological mime, in which he strips away Cephalus' pretense to piety and reveals that Cephalus' turn to religious ceremony is thoroughly mercenary, not reverent. Hence, we may conclude that Cephalus' departure from the dialogue in no way dramatizes the incompatibility of reason and piety. If anything, his departure is indicative of the divergence of rationalism from the virtue of reasonableness. Rationalism, thus understood, is an obstruction to the mutual opening of reason and reverence. With the departure of rationalism, this obstacle is removed.

THE PLACE OF REVERENCE IN POLEMARCHUS' TURN TO PHILOSOPHY

Cephalus, as already noted, does not attempt to universalize his rule of thumb. But Polemarchus rushes in where his father is too shrewd to tread. Polemarchus holds that his father's formulation does provide an adequate definition of justice, "at least if we are to be persuaded by [or to obey] Simonides" (331d5). Polemarchus thus acknowledges a requirement (chrē) to defer to Simonides. Socrates by no means disputes this requirement; he grants that Simonides is a man of wisdom and godliness (331e6). So he invites Polemarchus to identify "what it is you suppose that Simonides said correctly in speaking about justice" (331e1-2). Polemarchus thinks Simonides speaks not just correctly but nobly (kalōs) when he states that justice is rendering to each what is owed (331e3-4). We must note, however, that what Polemarchus espouses here is an unwarrantedly literal-minded interpretation of the poet. By the term "what is owed," Polemarchus evidently assumes that Simonides means exactly what another has lent him. Hence, Polemarchus deems superfluous the question of the mental capacity of the man in Socrates' thought experiment, the relevance of which even his father had appreciated. On this basis, he holds that his father's rule of thumb may be enforced over the entire range of just actions. Polemarchus maintains that it is just and right, regardless of circumstances, to return a borrowed weapon to its original owner, because such a weapon is plainly owed to its owner and because justice consists in returning what is

But before we go too far in disparaging Polemarchus' literal-minded veneration of Simonides, we must pause to ponder the significance of the manner of Socrates' questioning. Socrates asks no more of the young man than to declare what it is that he supposes Simonides says correctly. In other words, Socrates does not impose upon his interlocutor the Cartesian burden of proving beyond all possible doubt the truth of what Simonides says. Socrates thus avoids calling the wisdom of Simonides into question (see Adam 1902, 1:13; Bloom 1991, 316). But the significance of this insulation of Simonides from the rigors of

Socratic elenchus is commonly mistaken. Many readers see in it no more than the tact (and perhaps the tactic) of a philosopher who prudently camouflages his own awareness of the shortcomings of a conventional paragon, which an intellectually inferior interlocutor is supposedly incapable of appreciating. Such a view, however, assumes more than an inequality between the interlocutors; it posits a discontinuity between what Socrates knows in this matter and what lies within the capacity of Polemarchus to understand. It presumes that Polemarchus is unable to learn what Socrates can already discern. (The reader may wish to consider the extent to which this view implies a certain dogmatization of the essentially negative character of Socratic wisdom.) As an alternative to this view, I would simply suggest that Socrates' respectful treatment of Simonides is informed by his appreciation of the possibility that Simonides might well be right and by his collateral desire to help Polemarchus to acquire a similarly thoughtful appreciation. In other words, I am suggesting that Socrates reads Simonides in the way we have undertaken to read Plato. Socrates' mode of questioning Polemarchus encourages the lad's confidence in the poet's wisdom and, at the same time, calls upon him to exercise his critical abilities in identifying the formulation that best expresses this wisdom. We should note that Socrates endorses such a combination of conviction and discrimination throughout this dialogue on justice. He holds that this combination will ensure that inquirers will be, as he puts it, "both judges and advocates at the same time" (348b3-4). Socrates' locution, "both judges and advocates at the same time," recapitulates the linkage of the divergent operations of piety and reason, advocacy and criticism, which was suggested in the dialogue's opening sentence. But it is Socrates' own conduct in the inquiry that most strikingly dramatizes the correlation of these divergent operations, for he steadfastly advocates the cause of justice as sacred (368b7-c2) even as he conducts a searching investigation of its nature and goodness.14 It is no surprise, then, that Socrates proceeds as he does in his questioning of Polemarchus. He summons Polemarchus to be both an advocate and a discriminating judge of Simonides. By responding as Socrates directs, Polemarchus becomes a full participant in Socratic in-

So rather than ridiculing Polemarchus' literal-minded veneration of Simonides, Socrates attempts to encourage its development. He indicates that the phrase "to each what is owed" cannot be meant literally, for no one would say that a borrowed item is to be returned to anyone whatsoever, should its owner make such a demand when out of his mind (331e3-4). Socrates' nudge opens Polemarchus' eyes. It must mean "something else, by Zeus," Polemarchus now realizes, "for [Simonides] thinks that it is owed to friends to accomplish good and nothing bad" (332a9-10). Polemarchus reasons that if something bad results from returning a weapon to a friend who is out of his mind, it cannot be right to have returned what

one has borrowed. Polemarchus' devotion to friends works as a lever to dislodge him from the grip of a narrowly literal and unwarrantedly dogmatic interpretation of Simonides. Interestingly, his recollection of friendly solidarity has made it possible for him to exercise critical thought. Polemarchus now judges that it is the poet's statement on friendship—that it is owed to friends to accomplish good and nothing bad-that is his most important dictum. Consequently, the lad abandons his literal interpretation of "what is owed" without in the least abandoning Simonides. Polemarchus merely exercises the prerogative of interpreting Simonides out of Simonides, just as the classical formula for sound exegesis recommends. If attention to the whole of an authoritative body of writings demonstrates more respect for an author than does mere proof-texting, we may say that Socrates has already succeeded in bringing about an improvement in the quality of reverence Polemarchus is prepared to show Simonides.

As we have noted, this refinement in Polemarchus' reverence follows upon his own recollection of friendly solidarity. A hearty concern for that which is dear (to philon) is characteristic of the psychic capacity that Socrates terms spiritedness (thymos). 15 Polemarchus, whose name evokes the fiery spirit of a warlord, momentarily overlooked the special claims of friendship when he formulated his argument for the justice of returning deposits always and everywhere. He quite naturally swears an oath as he recovers himself and corrects this oversight. Polemarchus' vehemence combines anger for the past affront to friendship and zeal for its present correction. Socrates invites Polemarchus to complete the formulation of his understanding of Simonides' saying concerning justice, now that he has the special claims of friend-ship clearly in mind. "What about enemies," Socrates asks, "are we to render whatever it is that happens to be owed to them?" (332b5) "By all means," Polemarchus replies, "we are to render to them exactly what is owed, which I take to be the very thing that suits [prosēkei] an enemy from an enemy, namely something bad [kakon]" (332b6–8). So, according to Polemarchus' revised interpretation: (1) Simonides' phrase "what is owed" is best understood not literally but rather analogically, as the suitable or the fitting and (2) the suitable or fitting in the case of enemies is something bad. Polemarchus thus proposes that what Simonides means by justice is rendering something good to friends and something bad to enemies.

It may be inferred from Polemarchus' oath ("by Zeus!") that he has his heart—that is, his thymos—set on this definition of justice. It appears that Polemarchus' most heartfelt desire is to uphold and to do right by the distinctive status of friends. Socrates must nevertheless subject this understanding of justice to a searching examination if there is to be any further refinement of Polemarchus' piety. Such an examination calls for great delicacy, to say the least. Socrates conducts this examination in three steps, the outlines of which may be briefly indicated in anticipation of more detailed discussion below. First, be-

cause thymos is invincible (375a11-b1, 440d1-3), one cannot oppose its present orientation directly. Instead, Socrates seeks to disengage the spiritedness with which Polemarchus embraces the notion that justice consists in a sovereign power of distributing boons and blows. Socrates accomplishes this disengagement by showing Polemarchus that such a conception diminishes the excellence of justice and calls into question the goodness of loyalty to friends (332c5-334b7). Second, Socrates elicits a new recognition on Polemarchus' part of the dearness of the unknown good. 16 This recognition results in a remarkable reorientation of Polemarchus' spiritedness. Socrates achieves this reorientation by showing Polemarchus that the true friend is the good, even when this good is not yet apparent as such (334b7-335a5). The acknowledgment of the dearness of the unknown good, I shall suggest, constitutes genuine piety or reverence. Because this acknowledgment is informed by a recognition of the dearness (as distinguished from a putative knowledge) of the good, it establishes in the soul a robust loyalty to the authority of the good, which is resistant to the venal or hubristic tendency to declare oneself instead as autonomous. 17 Third, and finally, Socrates argues that the good is never a cause of corruption or harm. It follows from this that the determination to do damage or harm to anyone must involve turning one's back on the good—a manifest act of disloyalty toward the true friend! Socrates thus demonstrates, in terms that thymos itself will find persuasive, that justice involves a steady orientation toward the good and so cannot involve the determination to harm anyone.

The Disengagement of Polemarchus' Spiritedness

Socrates now commences in earnest his examination of Polemarchus' conception of Simonides' understanding of justice. "By Zeus!" he demands, with some spiritedness now of his own, "What would Simonides say if someone asked...?" (332c5-8). Judging from the thrust of Socrates' subsequent questioning, we may surmise that this oath represents a didactic expression of vexation at the feebleness of Polemarchus' present appreciation of justice. For Socrates immediately elicits Polemarchus' agreement that arts other than justice, each within its own domain, have the capacity to render what is fitting and due. Consequently, one is left to wonder just what, if anything, is rendered by the art of justiceand to whom (332d2-3). Polemarchus follows the line of questioning perfectly well. He maintains that justice consists in benefiting friends and damaging or harming enemies. But this is an unsatisfactory answer and does nothing to elevate the importance of justice, for the things fittingly assigned by other arts may also be understood, more generally, as goods and bads. When Socrates asks, "Who, then, has the most power to accomplish good for ailing friends and bad for enemies as regards disease and health?" Polemarchus sees the point. He accordingly ignores the claim of the just man and names the physician

instead. Similarly, when the question is repeated, now concerning voyagers facing danger at sea, Polemarchus again ignores the righteous and instead nominates the helmsman as the one most able to render good and bad.

Searching, then, for the arena in which justice might come into its own, Socrates challenges Polemarchus to say where it is that the righteous will prove to have "the greatest power to benefit friends and to damage enemies" (332e3-4). Polemarchus answers that it is "in the conduct of war and in alliances" (332e5). But evidently not (as Socrates recalls on the basis of Polemarchus' previous admissions) when we are sick or at sea (332e6-10).18 Polemarchus admits Socrates' point. Socrates then moves to broaden the perspective of the young "warlord," for Polemarchus so far has failed to mention the usefulness of justice in peacetime. Socrates alludes to this possibility and Polemarchus quickly responds that justice is indeed useful in peacetime, particularly in partnerships (332e11-333a14). But again, when Socrates invites Polemarchus to choose between the expert and the just man as the more useful and better partner in each of several transactions, his young interlocutor chooses the expert in every case. Polemarchus would prefer the collaboration of an expert draughtsplayer when positioning draughts, a mason when laying bricks, and a harpist when playing the harp. In all these cases we may say that Polemarchus rates virtuosity above virtue.

Yet there is one situation in which it is the just man who seems to Polemarchus to be the better partner—in partnerships where there is money dealing. But this turns out to be too broad an endorsement even for Polemarchus, for he admits, under pressure from Socrates, that if the partners are to use the money (say, to buy or to sell a horse in common), then someone who has technical knowledge (in this case, about horses) would be a better partner than the just man (333b11-c2). It is only when money is not put to use but merely needs to be kept safe that the just man is the better partner. Socrates summarizes the discussion, employing images that together represent the comprehensive human experience of war and peace: justice comes into its own "when there is need to guard shield and lyre and no need to use them; but when there is need to use them, it is the art of the infantryman and the musician that are of use" (333d6–9). Socrates thus presents the work of guarding or preservation as the least glorious, the least worthwhile, of human activities. Polemarchus is moved to agree that justice is useless for useful things and useful only for useless things. Socrates turns to his young interlocutor and remarks "Justice, then, my friend, would not be worth taking seriously at all" (333e1-2).

Socrates addresses Polemarchus as his friend (\bar{o} phile), while examining the notion that justice consists in benefiting friends and harming enemies. He thus invites us to ponder what good thing it is that he is accomplishing for this dear young man. Of course, many readers have doubted that Socrates is convey-

ing any benefit at all. After all, Socrates has just led Polemarchus to a fallacious conclusion; his denigration of justice clearly exceeds anything required by the logic of the argument. We agree. Socrates' disparagement of justice is, in every sense of the word, gratuitous. Certainly, nothing in the work of guarding or preservation requires such a disparagement. If anything, the notion of justice as safeguard or preservative implies an enormously attractive role for this virtue, as subsequent discussions in the Republic will elaborate. Justice Saves is by no means a slogan incapable of stirring the blood. But Socrates plays this down for the present, precisely because it is his concern to settle, rather than to stir, Polemarchus' blood. In so doing, Socrates accomplishes something very much of benefit to his friend. And the benefit is indeed gratuitous, that is, a true gift. For, as Socrates notes, Polemarchus' definition of justice-benefiting friends and harming enemies—is typical of the frame of mind of "some rich man who supposes that he has the power to do big things" (336a6-7). (It was Polemarchus, we recall, who at first threatened to use force to compel Socrates to remain in the Piraeus. In that threat, Polemarchus placed himself beyond the influence of reason; he refused even to listen to Socrates' attempts at persuasion. The only thing to which he would give way was even greater power [327c9].) Dazzled by the power to accomplish "big things," a youth such as Polemarchus will grow oblivious to the need to learn the good things. If such a youth is ever to begin to consider what is good, he must first be disengaged from his attachment to what he currently regards as big or great. So we may say that in Polemarchus' case, at least, Socrates' familiar use of the analogy between virtue and the arts does not merely serve to emphasize the role of intellect in what is ordinarily called moral virtue. The prosaic implications of this analogy serve, even more importantly, as an antidote to the charm that power holds over our understanding of human excellence.

Socrates invites Polemarchus to consider further the expert craftsmen in whose likeness he has been modeling the just man. It is noteworthy that in the course of this consideration Socrates never speaks of this expert in the professional form of address. For example, instead of referring to the physician (*iatros*) as such (as Polemarchus had done, 332d12), Socrates speaks of "the one who is cleverest at guarding against illness as well as engendering it unnoticed" (noson . . . phylaxasthai kai lathein houtos deinotatos empoiēsas, 333e6-7). The circumlocution draws attention to the possibility that true professionalism, embodied in the physician properly so-called, is not to be identified with moral neutrality or mere dynamic bivalence. It must be admitted, however, that even if it is not morally neutral in its essential act, technē does remain peculiarly liable to exploitation for alarmingly divergent purposes. It is with a view to this liability, I would suggest, that Socrates introduces to the discussion the term deinos, which means "terribly (or, perhaps, terrifyingly) clever," in order to characterize the disposition of one who exploits the equivocal or

bivalent potentialities of technical expertise. For the professional, like the clever man, plies a craft; but unlike the clever man, he never permits his craft to degenerate into mere craftiness. Socrates' strategy is to show Polemarchus that this attribute of cleverness or *deinotēs*, with which the lad's current conception of justice is contaminated, is not merely useless but is vicious in itself and repugnant to genuine friendship.

Socrates poses several leading questions and suggests a literary parallel, which together move Polemarchus to reject anything tainted by cleverness. Socrates induces Polemarchus to agree that (1) the most clever at striking a blow in battle is also the one to guard against such blows, (2) whoever is clever at guarding against illness is also most clever at causing illness unnoticed, and (3) the good camp guard is also the very man to steal what belongs to the enemy (333e3-334a4). Polemarchus is compelled by these admissions to conclude that the deinos guard—and so the just man, in accordance with his current conception of virtue—is essentially a clever thief (334a5–10)! Socrates then blames Homer for teaching Polemarchus this lesson. Homer, Socrates notes, is especially fond of Odysseus' grandfather, a man named Autolykos (roughly, "Lone Wolf"). In the words of the poet, this Lone Wolf "surpassed all mankind in thievery and in oath-swearing" (334b2-3; cf. Odyssey 19.394-95). What it means to surpass all mankind in thievery is plain enough, but how one wins such distinction "in oath-swearing" calls for an explanation. Stanford surmises that Autolykos excelled all mankind "by cleverly framing his oaths so as to leave loopholes for advantageous evasions later" (1958, 2:332). As a devotee of Hermes (from whom our word hermeneutics derives), Autolykos was able to exploit verbal equivocation and so was able always to get the better end of promises and bargains (Odyssey 19.396-98). Thus, in view of Polemarchus' preceding admissions concerning the bivalent potentialities of technical expertise and so of the righteous man himself, Socrates quite reasonably offers Homer's praise of Autolykos as a fitting epigram of Polemarchus' appreciation of justice.

But if the elevation of Autolykean cleverness to the status of righteousness is what his argument comes to, Polemarchus wants no part of it. "No, by Zeus," he swears, "though I, at least, no longer know what it is I meant" (334b7). This vehement rejection of Socrates' imputation indicates that Polemarchus would prefer to renounce his own claim to know what justice is rather than to endorse as just the cleverness characteristic of Autolykos. Surprisingly, Polemarchus is unmoved even by Socrates' stipulation that such cleverness be employed "to benefit friends and to harm enemies" (334b3-5). One might have expected this stipulation to have made all the difference to Polemarchus. There can be only one reason why it does not. The practice of Autolykean cleverness must itself be at odds with the good of friendly solidarity. Polemarchus evidently notices that Autolykos, the Lone Wolf, remains essentially a loner regardless of who happens to benefit from his

cleverness. Socrates' delicacy of expression has paid off; Polemarchus has come to see the terror signified by the term *deinos*. Indifference to the good, wherever it surfaces, makes us strangers even to those who are otherwise dearest to us.

Of course, in defense of cleverness, someone might assert that the versatility of technē implies the absence of a telos or goal proper to the art as art and so authorizes the clever man's willingness to ply his craft for evil as well as good ends. But this is mistaken. The versatility of the arts-which indeed renders them liable to such exploitation—simply reflects the importance of what the Greeks called kairos (the due measure, appropriate instrument, opportune time, etc.) in human affairs. The possession of technē entails an ability to address the exigencies of any occasion. Owing to the diversity of circumstances, an action that at one time promotes a particular purpose will at another time thwart it. There is, therefore, a necessary versatility in the capacity that the technical expert commands. For example, a physician will be equipped both to feed (a cold) and to starve (a fever); this versatility is properly exercised in the interest of promoting the intrinsic end of medicine, namely, health. The clever man exploits this versatility, however, not in pursuit of health but rather to further some extrinsic end. For example, "the one who is cleverest at guarding against illness as well as engendering it unnoticed" might take steps to starve his political opponent and to feed his favored candidate. Such an outcome might be thought to be attractive to a man like Polemarchus, who takes devotion to friends so seriously. But there is no reason to suppose that someone who is indifferent to the good of his own art is going to be any more attentive to the good upon which his "friendships" can be distinguished from merely arbitrary or chance associations. Polemarchus rejects cleverness, then, because he senses that it is at odds with the foundation of genuine friendship even though Socrates has stipulated that such cleverness is to be employed for the benefit of friends and the harm of enemies.

Moreover, at the same time that he heartily repudiates cleverness, Polemarchus reveals his new openness to self-examination. "No, by Zeus," he declares, "though I, at least, no longer know what it is I meant; yet it still seems to me that justice consists of benefiting friends and damaging enemies" (334b7–9). We may say that this remarkable statement, taken as a whole, indicates (1) that Polemarchus now recognizes that his opinion is an opinion, not knowledge; (2) that he is astonished at this recognition and so has genuinely learned something in coming to it; and (3) that his *thymos* is now oriented toward upholding or enforcing this recognition.

Polemarchus Acknowledges the Dearness of an Unknown Good

Polemarchus knows now that he does not know what justice is. He admits, nevertheless, that justice still

seems (dokei) to him to consist in benefiting friends and harming enemies. So Polemarchus has changed, even if what seems or appears to him has remained the same; he is now in a position to examine rather than merely to insist upon this opinion. Measured by Socratic standards, this is a most significant development. Socrates' response is to launch Polemarchus upon the examination of this opinion. He asks whether Polemarchus means by friends "those who seem to each to be good or those who really are good, whether they seem to be or not" (334c1-3). Polemarchus conjectures that one "befriends those whom he believes [hēgētai] to be good" (334c4). Polemarchus' word hēgētai implies rather more than a mere perception, which could be derivative from preexisting affinities: hēgētai designates instead a leading belief, thus compactly conveying Polemarchus' conjecture that it is one's belief concerning the good that is the hegemonic factor in determining his affinities, rather than vice versa. Such a hegemony is in fact essential to the independence of thymos, to its very existence as something more than the love of one's own. For if our belief concerning the good were exclusively beholden to what is nearest and dearest, our capacity for friendship could never transcend our cultural circumstances. Were this true, a social science informed by the doctrine of cultural relativism could eradicate any need for philosophy. But a truly hegemonic belief concerning the good, the only kind of belief worthy of thymos, cannot take its marching orders from what is currently familiar. Instead, as we shall see, it must be informed by an acknowledgment of the dearness of an unknown good.

Socrates next asks Polemarchus whether human beings err in their beliefs concerning the good, such that in their view many seem good who really are not good and many others do not seem good who really are (334c6-8). Polemarchus acknowledges that human beings do err in this way (hamartanousin 334c9). Socrates notes that it would then be just, on Polemarchus' account of justice, to harm the innocent. But there is no way (mēdamōs 334d7), Polemarchus declares, that he will brook such an enormity. Rather than affirm so transparent an injustice, Polemarchus vehemently denounces as burdensome and wicked (ponēros 334d7-8) any account of friendship, including his own, that is open to such an implication. In the case of a conflict, Polemarchus will side with what is right, rather than with what is his own. Granting that it is not right to harm the innocent, Socrates still wonders what is right. So he inquires, "Is it right, then, to harm the unjust and to benefit the just?" (334d9–10). Polemarchus answers that this appears to be nobler (kallion) than the converse. But, as Socrates proceeds to point out, this new formulation renders friendship completely irrelevant to the consideration of justice, contrary to what Simonides had said (334d12-e4). In other words, Socrates appeals to the authority of Simonides here in order to remind Polemarchus that one cannot utterly disregard friendship in the course of doing right. Polemarchus' task is to uphold the relevance of friendly solidarity in the

consideration of justice without permitting it to become a source of corruption. Polemarchus sees perfectly well, now, what must be done; he must qualify the role of perception in the determination of what is dear. For the sake of friendship, Polemarchus is prepared to move beyond the limits of perception. He urges Socrates to join him in changing (metathōmetha 334e5) what they had posited as the friend.

Socrates and Polemarchus had been supposing that it is the seeming good that is dear. Polemarchus proposes that they now define as philon that which both seems and really is good (Ton dokounta te . . . kai ton onta chreston, 334e10). He infers that the apparent good—if it is not also really good—is only apparently, though not really, dear (334e10-335a2). By the same token, we may say that the really good-f it is not also apparently good-is really, though rot apparently, dear. Socrates seizes the latter inference, noting that "on this account the good will be dear, as is fitting" (335a3). Socrates thus indicates that Polemarchus' new position brings to light the immediacy of the connection between what is really good and what is really dear. What is fitting has, on this basis, also become apparent: namely, that one's acknowledgment of what is dear is not exclusively a function of current perception. Following Socrates, we may suggest that the most important consequence of Polemarchus' reformulation of the definition of the pailon is not its obvious indication that the good must be perceived for it to appear to be dear but rather its subtle implication of the real dearness of a good that is not yet apparent as such. It is on this basis, we may surmise, that Socrates now speaks of a good that is not simply chrēston but agathos (335a3, cf. 334c4, 334e10). The verbal distinction—the contrast between these terms—indicates that the true friend is a good distinctively beyond what we presently recognize as useful (chreix) to us.

This insight permits Polemarchus to unhold the relevance of friendly solidarity to justice and, at the same time to resist its decomposition into nepotism. Polemarchus thus succeeds because he has found a true friend in the good. Put somewhat differently, Polemarchus finds that if he is to honor friendship as he deems fit, he must attend more to the existence of a sovereign good than to his own possession of a sovereign power. This finding, I suggest, marks the dawn of genuine piety or reverence in the soul of Polemarchus. Polemarchus' devotion to the cause of friendship does not require that he know the good, only that he acknowledge the dearness of the good he does not know. Now, this discovery by no means implies that Polemarchus does not have more to learn. In fact, he does, for in his first attempt to demonstrate his friendly solidarity with what is really 300d, Polemarchus agrees with the proposition that "it is just to benefit the friend precisely because he really is good [agathon onta], and to harm the enemy precisely because he really is bad [kakon onta]" (335a9-10). Thus it still remains for Polemarchus to learn that the determination to harm anyone will tend to alienate him from the true friend, rather than drawing him closer to it.

Polemarchus Learns That the Righteous Do No Harm

As matters stand, Polemarchus supports what may be called the homeopathic conception of justice—that it is right to do good things for the friend (who is good) and to do bad things to the enemy (who is bad). His recollection of the dearness of the true good has rekindled his commitment to uphold and to honor above all the distinction between friend and foe. Because it parallels this distinction by rendering good to the good and bad to the bad, the homeopathic conception of justice appears to Polemarchus to be elegantly or beautifully formulated (kalös legesthai 335b1). But Socrates wonders if it is the part of a just man to harm any human being whatsoever (335b2-3). Polemarchus replies, "Well, of course. One is obliged [dei] to harm those, anyway, who are both wicked and enemies" (335b4-5). Polemarchus believes that the righteous are bound to harm the truly wicked, for if they were not to do so they would fail to uphold the distinctiveness of the good. Polemarchus supposes that we demonstrate our allegiance to the good by treating those who are good in as different a way as possible from those who are bad. To shrink from doing bad things to bad men seems a failure of nerve in distinguishing the good from the bad.

It is reasonable of Polemarchus to insist upon the importance of maintaining distinctions. There is indeed something disorderly, shameful, and even ugly in the failure to make proper distinctions, especially distinctions between good and evil. Moreover, we may grant that good and evil are opposites, as are benefit and harm. But it is at this point that we must reconsider the nobility and the reasonableness of moral homeopathy. Is moral homeopathy truly kalon -is it even successful-in upholding, and illuminating, the fundamental opposition of good and evil? Or is it the part of a just man never to harm any human being whatsoever? Now Socrates may well agree with Polemarchus that the noble or beautiful somehow glorifies and illuminates the distinctiveness of the good. But he clearly departs from Polemarchus' view by denying that the kalon consists in anything like a homeopathic operation. Socrates argues, for example, that the result will not be kalon if a statue painter assigns the finest color, purple, to the finest part of the body, the eyes (420c4-d5). If the statue painter were to guide his actions by this homeopathic pattern, it would turn out that the statue's eyes "do not show themselves as eyes at all." Though we might commend the sincerity of this statue painter, who simply wishes to honor what is fine by anointing the finest part of the body with the finest color, we must make no mistake about the seriousness of his shortcoming, for his homeopathic aesthetic obscures rather than illuminates the eye—the very organ in which beauty and nobility in the body is most evident.

Polemarchus, along with the statue painter of Socrates' example, may be faulted for committing the error of *moralism*. Moralism asserts itself in a certain

preoccupation with rewarding good and punishing evil, which causes one to pay insufficient regard to the ontological significance of the thing that is subject to these judgments. So when Socrates asks whether it is the part of a just man to harm or to do damage to any human being whatsoever (hontinoun anthropon), it happens that Polemarchus omits any mention of anthropos-of human being-in his affirmative response (335b2-5). Polemarchus, of course, believes that a homeopathic assignment of benefit and harm is the just and ordinate response to the presence of good and bad. But the grammatical ellipsis indicates that Polemarchus does not properly appreciate the ontological implications of such an undertaking. Polemarchus has not yet faced up to the fact that it is a human being, and not evil itself, that is damaged by homeopathic justice.

As Socrates hastens to point out, however, it is a real being who is made worse when real harm is done; this worsening of a real being involves a diminution in virtue or excellence (areten 335b6-c3). Polemarchus proves to be receptive to Socrates' reminder of the general ontological significance of doing harm: "That must be," he replies (335b12). Socrates now addresses Polemarchus as his comrade or collaborator (ō hetaire 335c1). Together they maintain that when human beings are harmed it is as human beings (i.e., in respect of human excellence) that they are diminished. The comrades dismiss other notions of harm, which are, of course, conceivable but are nevertheless not telling in the present instance, because such notions fail to reach the ontological underpinnings of right and wrong. In commencing a search for these underpinnings, we must remember that the deprivation of contingent goods may not constitute a harm at all. Socrates later notes, for example, that sickliness actually proved to be a boon to another of his comrades, Theages (496b6-c3). Owing to their circumstantial nature, the presence or absence of such contingent goods in any given pattern of distribution does not truly shed light upon the fundamental opposition between good and bad. But Polemarchus believes that it pertains to justice to uphold this opposition. So justice cannot be a merely contingent human good, it must be essential to what we mean by human excellence (335c4-5).19 Once Polemarchus has acknowledged this, he leaves the distribution of boons and blows to others and joins Socrates in the search for this essential, and not merely contingent, human excellence.

Polemarchus' rejection of cleverness has by now radically altered his conception of art. Thus, we find in the present passage that he understands musicianship and horsemanship as professional qualities rather than as exploitable crafts or powers (335c9–13). Polemarchus has learned to concentrate on the essential act of a *technē* as distinguished from its divergent potentialities. He no longer desires to acquire such an equivocal *dynamis*, for he has come to understand that friendly solidarity is in no way enhanced by the exercise of power in this sense. To be loyal to the true friend, which is the good, one must uphold its

fundamental opposition to what is bad. But one can uphold this opposition only by admitting that it is impossible for justice to cause harm or damage to any human being. Justice cannot consist in a power whereby one even alternates good and bad. If justice could ever cause harm, then it would follow that the essential human excellence could cause its own diminution. In that case, the human good would cause the human bad. But if the good were *ever* to cause the bad, good and bad would be only conditionally and not fundamentally opposed to one another. In order to guard against this implication, Polemarchus embraces without the slightest reservation the proposition that justice never works harm (335d13).

It follows that if goodness never causes harm, one can do harm only by parting or turning oneself away from the good. Polemarchus' thymotic passion for friendly solidarity (and thus for upholding the opposition between good and bad) can only be satisfied, then, if he is himself turned steadily toward the good. Informed by this insight, Polemarchus' spiritedness will henceforth become the perfect ally of philosophy, permitting nothing to distract him from the good. Spiritedness must be so allied in order to escape distraction by the juvenile desire "to settle a score." Socrates will later allude to the undistracted attention to the good as the greatest study (to megiston mathēma) and the one most appropriate for the philosopher (504e4-505b4). So we may infer that only philosophy will satisfy and correctly order the thymotic longings of Polemarchus' soul. But we must also note that philosophy can only be pursued if one first recants the childish notion that it is ever just to harm anyone.

Socrates finally invites Polemarchus to become his partner in defense of Simonides (and other wise and blessed men) by fighting anyone who holds that such men deem it right to harm anyone (335e7-10). Although the argument indicates that Simonides could not have meant that it is right to harm anyone, it has of course not settled what he did mean. Socrates and Polemarchus thus become partners in defense of a good they do not themselves possess or know. Their acknowledgment of the dearness of this unknown good is not only evidence of Polemarchus' piety, it also comports perfectly with the continuing conduct of philosophical inquiry. Plato will not wait long before giving his reader an example of the Socratic-Polemarchean partnership in combat, in which the harmony of piety and philosophy is made perfectly clear.

POLEMARCHUS' CONTRIBUTION TO THE REMAINDER OF THE DIALOGUE

Considering Polemarchus' ripening into a representative of true piety, it is only appropriate that his important contributions to the subsequent movement of the dialogue are conveyed in a most modest and quiet manner. We should take notice of these contri-

butions by way of completing our discussion of his role in the *Republic*.

Polemarchus appears twice more in the dialogue. We hear from him again very soon, in the course of Socrates' conversation with Thrasymachus. In the midst of the first half of this conversation, Plato introduces a brief interlude in which Polemarchus confronts his dramatic foil, Cleitophon. The point of this confrontation, I suggest, is to show the reader that Polemarchus is not at all like Cleitophon. One might say that the confrontation between Cleitophon and Polemarchus in this passage supplies the best index of Sccrates' success in his pedagogical undertaking with Polemarchus;²¹ for rather than turning out to be like Cleitophon, Polemarchus proves to be diametrically opposed to him. Yet the comparison of the two young men is inevitable. They both represent tendencies characteristic of the broader political community. Polemarchus, we recall, attempts to impose the force of democratic numbers in the dialogue's opening enactment of the arrest of the philosopher (327c7–14). And Cleitophon advocates the purest form of legal positivism proposed in the dialogue. Cleitophon goes further in this respect than even Thrasymachus; for Cleitophon holds that when Thrasymachus says that might makes right, what he means to say is that right is anything the politically dominant class believes to be to its own advantage (340b6–8). But this clever loophole, which could have insulated Thrasymachus' position from Socrates' refutation, would also make philosophical inquiry impossible and unnecessary. Philosophy is possible or necessary only if one first recognizes the importance—nay, the dearness—of what he does not know. But there is clearly no room for such piety in Cleitophon's world. Cleitophon's perceptionism enthrones every man as measure and absolute ruler of his own private cosmos. Cleitophon's anxiety to escape refuration leads him to annihilate the possibility of recognizing his own ignorance and, along with it, the possibility of ever learning anything. But Polemarchus, in the course of his conversation with Socrates, has come to appreciate the dearness of the unknown good. He could only do this, as we have seen, by first recognizing the limitations of perception, the inadequacy of the seeming good. So it is inevitable that Polemarchus will find himself at loggerheads with Cleitophon, for whom the seeming good is a jealous god. Yet it does no harm to Cleitophon-and in fact it positively benefits Thrasymachus-when Polemarchus testifies that Thrasymachus did nct say that justice is whatever seems to be advantageous to the mighty (340a1-b9). By speaking out and revealing his own sympathies, Polemarchus makes it more difficult for the crowd-pleasing rhetorician to adopt Cleitophon's loophole. In this sense, Polemarchus plays an important role in making it possible for Thrasymachus and Socrates eventually to become friends. Had Thrasymachus followed Cleitophon's impious tack, undermining the very possibility of philosophy, he could never have become Socrates' friend and might very well be regarded as

his enemy (498c6–d1). This, then, is how Polemarchus first answers Socrates' call to do battle in partnership with him. He is Socrates' true ally in upholding the possibility of philosophy and in waging a battle from which everyone might benefit.

The next and last time we hear of Polemarchus in the Republic is at the opening of book 5. His contribution to the conversation in this passage is muted but is, nevertheless, enormously significant, for it is with hardly more than a whisper that Polemarchus moves Adeimantus and the entire inquiry out of the theoretical doldrums. Taking his cue from Polemarchus, Adeimantus articulates their common concern (hemeis 449d1, tithete 450a4), speaking at considerable length of Socrates' faintheartedness (aporrhathymein 449c2) and injustice in "stealing a whole eidos of the account" of the city-in-speech. So it is Polemarchus who propels Adeimantus and the others to put a stop to Socrates' fainthearted speculation concerning the forms of bad constitution. As a consequence, Socrates is compelled to return to the more arduous task of completing the articulation of his model city. From this nearly inaudible yet decisive intervention of Polemarchus there develops the "digression" of books 5-7, in which Socrates and his interlocutors renew their pursuit of philosophy and the good with an unprecedented seriousness.

CONCLUSION

Socrates goes down into Piraeus with Glaucon both to pray and at the same time to see. I have suggested that the desire to reconcile reason and piety, which is manifest in this twofold intention, is a just and fitting response to what is perhaps the most vital feature of the human condition. As Socrates maintains, human beings are contingent creatures who nevertheless possess the ability to share somehow in the noetic activity characteristic of the divine. I have acknowledged that the departure of Cephalus, who abandons inquiry in order to attend to certain sacred rites, induces us to consider the tension between piety and reason. But I have also suggested that the textual passage centered on this focal event reveals that it is not Cephalus but Polemarchus who, together with Socrates, deserves to be regarded as the dialogue's exemplar of piety.

The textual evidence suggests that Socrates intends to unmask Cephalus as a representative of rationalism rather than piety. Following this evidence, I maintain that we must reject the widespread notion that Cephalus' departure constitutes Plato's dramatic indication of the fundamental incompatibility of philosophy and piety. Instead, we would do better to conclude that Cephalus' departure dramatizes the incompatibility of Socratic philosophy and rationalism. Because rationalism is also hostile to genuine piety, Cephalus must take his leave before true piety can be introduced and reconciled with Socratic philosophy.

I have argued that it is Polemarchus whose devel-

opment dramatizes the character of genuine piety. Polemarchus enters into the conversation advocating a blind faith in the authority of the wise man, Simonides, as a basis upon which to decide the question of justice. But Socrates ripens and fortifies this piety by bidding Polemarchus to consider "what it is you say that Simonides said correctly in speaking about justice." It might seem that such a question could not be seriously intended to initiate a philosophical inquiry because it takes for granted that in some sense Simonides is right. This assumption, I agree, is by no means beyond all possible doubt. But the analysis I have offered suggests that it is precisely the piety—or "bias," if one insists—of this form of question that underlies the love of wisdom. Piety, thus understood, keeps philosophical inquiry steadily concentrated upon the good, undistracted by other considerations.

I have suggested, by the conduct of this inquiry, that one can best approach the study of Plato in the same way. In order to learn from even the closest study of small passages of Plato, the reader must hold dear what he does not know. The reader must be supremely attentive (we might even say reverential) toward the text. This requires respect for the text's structural articulation and for the dramatic context of every argument. With this reverential approach, one recognizes that logical ambiguity may serve as an impeccable conveyance of significance; that silences may speak eloquently; and that blunders that "would shame an intelligent high school boy" may become for the attentive reader critical pointers to an underlying, coherent teaching. The authority of logic is not thereby rejected. Instead, the reader assumes the responsibility to remain alert enough to supply the suppressed premise of an enthymeme. Piecemeal logical analysis is thus transcended in the direction of the holistic consideration of logographic necessity. Such a transcendence sustains the virtues of reason as against the shortsightedness of rationalism. In this way, moreover, the student of Plato adopts Socrates' recommendation to become both judge and advocate at the same time. On the other hand, I would suggest that the more perfectly neutral inquiry "Is Plato right or wrong?" will inevitably distract one's inquiry from the good merely in order to settle a score with an author. Instead of serving as a portal to the good, the author becomes in this case the principal object (and hence, inevitably, an obstacle) to what was intended as a philosophical investigation.

I have argued that Polemarchus' spiritedness is initially inclined toward such score settling. Polemarchus passionately strives to achieve the most rigorous possible discrimination between friend and foe and thus hits upon the notion that to do right one must benefit friends and harm enemies. This notion in turn tends to provoke a dreadful appetite for the power to dispense benefit and harm. Socrates opposes this appetite, first, by disengaging Polemarchus' enthusiasm for this notion of justice. He does this by showing that its practice implies a status for justice that is inglorious and which, moreover, casts doubt upon

the goodness of friendly solidarity. Socrates then helps Polemarchus to identify the proper object of his heart's desire in the true good, even when the good is not yet apparent as such. I maintain that Polemarchus' acknowledgment of the dearness of the unknown good constitutes the definitive indication of genuine piety in the conversations of book 1. Because only the disposition to hold dear what one does not yet know can keep one mindful of the need to learn, we may say that piety in this sense is indeed a docility of soul, not in the mistaken current sense of intellectual passivity but in the original sense of docilitas, or "learning readiness." Such docility, moreover, is the polar opposite of the hubristic resistance to learning, or amathia, which is the culprit so often obstructing philosophical inquiry in Plato's dialogues. With Polemarchus' recognition of the dearness of the unknown good, his spiritedness is set squarely to the task of upholding the opposition between good and bad. It remains only for Socrates to persuade Polemarchus that this opposition cannot be maintained unless justice is oriented steadily toward the good; as a consequence, Polemarchus learns that the just man cannot seek to harm anyone.

Thanks to Socrates' examination of Polemarchus, we are better able to appreciate the character of piety or reverence. Typically, this quality is mistaken as a merely submissive or passive deference to higher authority. But it is more properly understood as an acknowledgment of the dearness of (and hence as a receptivity to) the unknown good. Such receptiveness is manifest not in blind faith but in a questioning that is searching even as it anticipates the truth or goodness of the thing questioned. Piety in this sense is characteristic of one who is at the same time both judge and advocate, and yet neither skeptic nor dogmatist. I thus conclude that it is Socratic piety (and not its diametric opposite, Cartesian doubt) that is the disposition most congenial to the love of wisdom. Piety, we may say, is not merely necessary to thwart the persecution of philosophers. Piety is essential to the pursuit of philosophy.

Notes

- 1. Citations in this essay to the *Platonis Opera* (Oxford, 1900–1907) supply the standard Stephanus divisions of page, section, and line. Unless indicated otherwise, all references are to the *Republic*. The translations are my own.
- Of course, to say that this understanding is accessible is not to say that any particular student will in fact gain access to it; but it is good pedagogical practice never to lose sight of this possibility.
 - 3. See also Strauss 1965, 1–31 idem 1979.
- 4. As it happens, Stephanus divides this passage into 44 sections (327a–336a), with Cephalus making his departure in the last line (331d9) of the twenty second section. The eidetic standing of this collection of 44 sections may be better appreciated if one notes that it already comprises a sufficiently diverse assemblage of interlocutors to reflect something of the character of the *Republic* as a whole. Cephalus, Polemarchus, and Socrates may be said to correspond to the three classes (money-maker, warrior, and philosopher) of Socrates' model city and thus may be said to anticipate the problem of the

wholeness of its politeia and perhaps of politeiai in general. Euben is right to observe that the triplet of Cephalus, Polemarchus, and Thrasymachus does not correspond to the threefold structure of the model city (1990, 248). Thrasymachus, after all, is not a philosopher. Of course, neither Euben's observation nor my claim concerning the significance of the passage upon which I propose to focus is meant to imply that Thrasymachus is unimportant. On the contrary, I would suggest that his presence in book 1 poses the important problem of philosophy's need to incorporate rhetoric while at the same time separating itself from sophistry. But one cannot talk of everything at once: if we try, we shall find ourselves impaled upon the "forest" horn of the forester's dilemma and reduced to the formulation of cocktail-party generalizations. The challenge is to find a way to think and talk about the details nonreductively, that is, while preserving their relationship to the whole.

- 5. I am thus inclined (with Brann 1967, 88, 113) to view the narration of the Republic as an example of the Pythagoreanism of Plato's Socrates. Pythagoreans sought to cultivate a capacity for just this sort of recollection. According to the testimony of Iamblichus, "a Pythagorean man does not arise from his bed before he has recollected what happened yesterday" (Life of Pythagoras 163.20, cited in Brann 1967, 113). This recollection would be a private exercise. Hence, Socrates' narration of Plato's Republic may be likened to a dramatic soliloquy. Nevertheless, one might wish to maintain that Socrates does have a circle of auditors who listen to his rehearsal of the conversation of the Republic, as seems suggested by a possible (though by no means necessary) interpretation of the opening scene of the Timaeus. There is, however, no evidence internal to the Republic to support such an interpretation.
- 6. An example from the present passage will suffice to illustrate this point. Socrates expresses personal admiration (egō agastheis) for Cephalus in a narrative gloss, when the latter reckons that a good way of life is more important to personal happiness than the capacity to enjoy sexual pleasures (329d7). I take it, then, that we may understand this admiration as sincere, if provisional. On the other hand, it is in direct discourse with Cephalus himself that Socrates describes as pangkalōs (i.e., beautiful in every respect) Cephalus' view that money is chiefly useful in making it unnecessary to commit injustice (331c1). Hence, I am inclined to take this evaluation with the proverbial grain of salt. In fact, Socrates' pretentiously exhaustive word pangkalōs might be understood as insinuating that in some decisive respect Cephalus' notion is quite the opposite of beautiful. The sequel, as we shall see, confirms this insinuation. Such is the character of Socratic irony.
- 7. Socrates employs this te... kai hama formulation throughout the Republic to indicate the pairing of things that might well be regarded as irreconcilable. He remarks that the discovery of such a pairing naturally awakens dialectical thought (524e2-5). Sometimes, however, the "longer path" of dialectic is postponed and a provisional understanding is accepted merely by hypothesis (as indicated, for example, at 436d4-437a9). For a discussion of the pedagogical significance of this postponement of dialectic and its importance for the interpretation of the political institutions of Socrates' model city, see Dobbs 1994.
- 8. The case that Socrates' conventional religious practice is more than window dressing is made by Lloyd-Jones, among others, who notes that in late fifth-century Athens many educated people realized "that the traditional beliefs and observances were by no means incompatible with a more sophisticated kind of theism; belief in a god or gods that had been defined by the doctrines of philosophy could easily go together with the maintenance of the ancient worship" (1983, 134).
- 9. Adam points out that in Attic literature the phrase the goddess regularly denotes Athena (1902, 1:62). Nevertheless, he rightly considers evidence internal to the Republic to be more compelling than regular Attic usage in interpreting this phrase; this internal evidence suggests an identification of Socrates' goddess with Bendis. I agree with this assessment,

but venture further to say that it would be mistaken to substitute terms, reading Bendis instead of the goddess in hope of improving upon Socrates' use of an ambiguous phrase. It is more prudent to keep open the possibility that the ambiguity implicit in Socrates' speaking of "the goddess" is meaningful precisely as such. While the future participle proseuxomenos plainly indicates Socrates' intention to pray, his ambiguous diction in the case of the intended recipient of these prayers (Socrates himself never uses the name Bendis) indicate that he does not mean to pray to Bendis qua Bendis. Such ambiguity may be the most economical means of conveying the complexity of Socrates' recognition of this cult as reflecting an aspect of some unknown, though necessary, god. This would also explain why it appears that "Plato apparently regards the content of prayers as more important than to whom they are addressed (Jackson 1971, 34).

10. Of course, some readers are inclined to dismiss Socrates' testimony as ironic. But a careful review of the text will find no warrant for such a dismissal in this case. In the passage typically cited as evidence of his ironic intent, Socrates is commenting on the difficulty of persuading his fellow citizens of the importance of persisting in his crossexaminations. "If I say that it is impossible for me to keep quiet because this is to disobey the god, you will not be persuaded by me, on grounds that I am being ironic" (hôs eironeuomenoi, 37e5-38a1). It should be noted, however, that the hos-plus-participle construction, which Socrates employs in the final clause of this sentence, is used in Greek to give the reason or purpose of someone other than the speaker without implying that it is also the speaker's understanding of the situation (see Goodwin, Greek Grammar §1574). Hence, there is no reason to construe Socrates' statement as an admission that he is being ironic; his statement merely affirms that others will suppose that he is. Perhaps many in the democratic jury will doubt Socrates' veracity in this matter because they are not themselves inclined to take the oracle at Delphi (or the voice of any other daimon) very seriously but confide instead exclusively in their own autonomous will. So it happens that Meletus, the poet, succeeds in his indictment of impiety against Socrates only with the support of Anytus, the democratic politician. The democracy naturally treats complicity in the rearing of oligarchs as the functional equivalent of impi-

11. Morgan makes an intriguing point, noting that inasmuch as he is a metic, Cephalus resembles the human soul, which also is a sojourner "living temporarily in the world of history, politics and moral conduct, . . . always anticipating its future and the possibility of permanent citizenship among the divine" (1990, 100). I think this suggestion is even more pertinent to Cephalus' son, Polemarchus, who is also a metic but whose anticipation of the destiny of his soul is not marred by his father's anxieties.

12. See n. 6.

13. The term rationalism is of course a modern coinage. Ancient authors described this tendency in a more frankly pejorative manner, as a manifestation of hybris or recklessness. Such value-laden language testifies to the clarity of the divergence, in the view of these authors, between what we call rationalism and the true virtue of reasonableness. Dobbs (1987) and Saxonhouse (1988) may be consulted for further discussion of the ancient appreciation of the discrepancy between the virtue of reasonableness and the recklessness of rationalism. It is my intention here to present Socrates as a positive case in point, for Socrates' examination of Polemarchus, which is remarkably deferential to the authority of Simonides, remains a model of reasonableness, though it certainly would not pass Cartesian muster. As I shall suggest, Socrates' conversation with Polemarchus thus reveals that piety is more congenial to philosophy than is radical doubt.

14. In his attempt to argue that the sacred is not a concern for the philosopher but only for the city, Benardete fails to take account of the significance of this linkage of advocacy and criticism (1989, 82–83). Specifically, he faults Glaucon (who recalls Socrates' acknowledgment of a "sacred task to help justice," 368b7–c2, 427e1–2) for failing to appreciate the

distinction between searching for justice and helping justice. But it is reasonable for Glaucon to combine these concerns; by yoking the tasks of searching and helping, he faithfully executes Socrates' intention that they be "judges and advocates at the same time" (348b3-4). Although there is much to admire in Benardete's book, I maintain that we will never adequately appreciate the philosophical significance of Socrates' undertaking in the *Republic* until we acknowledge the importance of his pairing of piety and reason, advocacy and criticism.

15. Thymos, as Aristotle explains it, is the power of soul whereby we love or hold something dear (philoumen); it is indomitable and prerequisite to a capacity for rule and for independence (see Politics 1327b18-1328a16; cf. Plato, Republic 374a12-b2). Zuckert writes pithily that "Socrates identified thymos, or spiritedness, as the psychic origin of distinctively political action. . . . [In Socrates view,] political order does not arise directly from one's own desires or [even from] the means best calculated to realize those desires but rather in reaction to the excessive desires of others" (1988, 2-4). Socrates treats thymos thematically, though incompletely, in book 4 of the Republic (437a4-10, 439e2-441d4). An adequate consideration of the classic understanding of thymos, the seat of the emotions of love, anger, and indignation (to say nothing of the spirit of independence and self-sacrifice), would require a careful study of these and other passages.

16. Strauss notices that Hamlet's famous soliloquy illustrates the tendency of thymos to shift from "the justified indignation about injustice . . . into the unjustified indignation about unrequited love. This is perhaps the deepest secret of spiritedness and therefore at least one of the deepest secrets of the Republic" (1989, 168). To this remarkably incisive comment I would like merely to append the observation that in some sense the opposite of unrequited love is the discovery of an unknown friend. Such a discovery, which Polemarchus is about to make with Socrates' assistance, will naturally counter the thymotic tendency toward unjustified indignation. Moderation is thus nourished by Socratic piety.

17. Piety in this sense is utterly alien to the conduct of Euthyphro, the pseudospokesman for piety in the Platonic dialogue named after him, for Euthyphro plunders his cultic expertise to claim for himself the very prerogatives of divinity (see Strauss 1989, 197-98). Readers interested in the relationship between the Euthyphro and the Republic should also observe that Euthyphro's final definition (that piety consists in commercial transactions with the gods, 14c4-15b3) would lend credence to Cephalus' decadent piety. Socrates' refutation of this final definition, then, would likewise undermine Cephalus' position. But Socrates' refutation, which annuls Euthyphro's designation of self-serving commerce as the attendance (therapeia) that is due the gods, leaves open the possibility that some other relationship of attendance-noncommercial but as yet unspecified-might well constitute the true character of piety (see Euthyphro 13a1-2). It seems to me that Polemarchus' acknowledgment of the dearness of the unknown good qualifies as this other kind of attendance. Thus, the Euthyphro may be said to culminate in the refutation of Cephalus and the anticipation of Polemarchus. We may expect, then, that the Republic will involve a further elaboration of the consideration of piety initiated by Plato in the

18. Justice may yet regain its prominence in the case that one is both sick and at sea at the same time, for then an appeal would have to be made to some third man beyond the physician and the helmsman to determine which of their possibly conflicting prescriptions to follow. Because of the familiarity with seasickness typical of a seafaring people like the Greeks, we may surmise that this implication is not entirely foreign to Socrates' intention in the choice of his examples.

19. Failure to consider this point has led many readers to the erroneous conclusion that it is foolish of Polemarchus to suppose that justice exhausts what we mean by human excellence. Of course, certain conceptions of justice are less than exhaustive of human excellence; some conceptions are even at odds with it. Justice understood as the imposition of arithmetic equality in external goods, for example, might well subvert the excellent endeavors of some of the more talented members of society. But such conceptions of justice are blunted by the incongruity of their concern for contingent goods and so cannot penetrate to the depth that Socrates' present argument requires. Polemarchus, then, follows the train of Socrates' argument better than many of his critics, for once one is required to consider the issue ontologically, it may be necessary as well (kai tout' anangkë 335c5), as Polemarchus agrees, to accept righteousness as the good essential to human being. Moreover, if it is true that the central books of the Republic vindicate the righteousness of philosophy, then Polemarchus' formal identification of dikaiosynë and human excellence will prove to be robust enough to withstand the rigors of the highest intellectual peaks of the Republic.

20. Failure to perceive this development in Polemarchus has led many readers to complain of the inconsistency between the treatment of arts in the present passage and the Autolykean account offered only a few pages earlier. But Polemarchus has consistently viewed the arts from the perspective of justice, as he understands it. As his understanding of justice undergoes change, so does his view of the arts. There is no glaring oversight here, as some readers imagine, but only a good example of human learning.

21. If one wishes to go outside the Republic for confirmation, there is of course Socrates' remark in the *Phaedrus*, affirming that "Polemarchus has turned toward philosophy" (Phaedrus 257b3-4).

THOUGHTLESS ASSERTION AND POLITICAL DELIBERATION

MELISSA A. ORLIE University of Illinois, Urbana

Predominant views of political deliberation represent it as a matter either of "contemplation without interest" or of interest without contemplation. Whether we claim that political thinking can transcend power or that it is simply a vehicle for it, we abet a nihilistic political culture and authorize the thoughtless exercise of power. What each view denies—or insufficiently explores—is thinking's capacity to transfigure "interest" and power without pretending to transcend them. By contrast, political perspectivism incorporates multiple perspectives in an effort thoughtfully to respond to the will-to-power that attends our location in the world. We need political spaces if we are to become responsive agents of power, because we often can neither recognize the effects of our activities without the benefit of others' perspectives nor alter those effects by our efforts alone.

Thought must consider the process that forms it and form itself from these considerations.

-Foucault, Language, Counter-memory, Practice.

Taking the canonical texts of Western political theory as our guide, we could conclude that the activity they represent, political thinking, is at best paradoxical and at worst impossible. With few exceptions, thinking (usually equated with philosophy) and politics (derogatorily associated with power and opinion) have been judged antithetical. This conclusion is moored in contestable beliefs about the relationship of power and thinking, body and mind. These assumptions both impoverish thinking and consign politics to the thoughtless exercise of power. Reading Friedrich Nietzsche and Hannah Arendt together, I challenge these views and offer another perspective on political theorizing.

The body as figure is one of Nietzsche's primary vehicles for disparaging the views of others, as well as a means of enacting his own, alternative way of thinking.1 Nietzsche's critique of objectivism, or "contemplation without interest" is well known (1967c, 118-19). But his critique of subjectivism or interest without contemplation, is often ignored, so that Nietzsche is still often converted into an advocate of some variant of irrationalism or ruthless assertion. To interpret Nietzsche's writings in this way is, however, seriously to misconstrue them. As Nietzsche wrote in *The Gay Science*, "the greatest danger" is "the eruption of arbitrariness in feeling, seeing, and hearing, the enjoyment of the mind's lack of discipline, the joy in human unreason" (1974, 130). In other words, the greatest danger is the repudiation of thinking and its consequences. Both "contemplation without interest" and interest without contemplation are aspects of such thoughtlessness and manifest the unitary point of view that Nietzsche associates with nihilism (1968, 70). By contrast, as a perspectivist, Nietzsche is attentive to will-to-power (evinced in the plurality of bodies and their effects) and its potentially affirmative relationship to thinking's capacities. Perspectivism is located, interested thinking and its goal is the incorporation of multiple

perspectives in the service of controlling "one's Pro and Con" to refashion who one is becoming (1967c, 119). The transfiguration of the *body* proves to be a potent metaphor in pursuit of perspectivism's goal.

Locating thinking, or "reason[ing] the particular," is usually conceived as a matter of judgment, whether aesthetic, moral, or political. Hannah Arendt has furthered our understanding of this reflection attuned to particulars.² While there can be no doubt that Arendt chose Kant as her primary touchstone for understanding thinking and judgment (Arendt 1977, 197–264; idem 1978; idem 1982), the heavy reliance on him obscures a rich, Nietzschean vein in her political theory.³ Contrary to the most common view, Nietzsche may further our understanding of the ways of thinking that make specifically political power and deliberation possible.⁴ He thereby prefaces (though he himself does not pursue) a revaluation of politics.

In Arendt's view, Kant needs her for his political philosophy to appear (Arendt 1982, 7-8). Nietzsche also needs her if we are to conceive the significance of his writings for political thinking. Indeed, if perspectivism is to be actualized or to avoid repugnant forms (Fowler 1990), it must (contra Nietzsche) be political perspectivism, because (as Arendt teaches us) politically constituted commonality is a condition of the appearance and worldly effects of a plurality of perspectives. In short, perspectivism is necessarily a political practice.⁵ But similarly, Arendt needs Nietzsche-and in ways she does not acknowledge. I wonder whether the political spaces that Arendt commends can be created, sustained, and esteemed without keeping before us what Nietzsche teaches about the relationship between thinking and power. Contrary to Arendt, I contend that political thinking must be perspectival, because only by so responding to our bodies, "private" locations, and their effects can we initiate the political spaces in which plurality appears and is, if transfigured, preserved. In short, word and deed are political only when they seek to enact

Both Arendt and Nietzsche challenge predominant views that equate thinking with knowing and thus

with the search for truth, rather than meaning (Arendt 1978, 14-15, 57-65).6 Arendt follows Nietzsche in disclaiming the distinction between "reality" and "appearance" (e.g., Arendt 1978, 10; Nietzsche 1954, 485-86; idem 1968, 305-6) but her characterizations of "mental faculties" sometimes verge on reinstating the distinction. Nietzsche's corporeal thinking registers thinking's effects in the world. Arendt wondered whether thinking, as an activity that disturbs given or thoughtless truths, might have such effects (1971, 418; 1978, 71), but her views about the political relevance of the body unduly circumscribed her efforts to elaborate them. Just as Arendt's acute sense of the relationship between political spaces and the appearance of a plurality of perspectives enables us to see the political-theoretical significance of Nietzsche's writings, his transfiguration of the relationship between body and mind clarifies what worldly, political effects thinking might have. Together, Nietzsche and Arendt help us (re)imagine political theorizing, and the enhanced political vision that emerges from an encounter between their writings attests to the fertility of such political perspectivism as mutual transfiguration among different locations and views.

TRANSFIGURING THE BODY OF THE "THEORETICAL MAN"

An interpretation claiming an affinity between Nietzsche's writings and political theorizing may seem implausible, given Nietzsche's animosity for the "theoretical man" Socrates (e.g., 1967a, 82-86, 94-98, 109-14; 1954, 473-79). Nietzsche claims that Socrates and the dramatist he inspired, Euripides, are responsible for the degeneration of "the old Marathonian stalwart fitness of body and soul" that once distinguished Athens (1967a, 86). The corruption of tragedy marked this decline. The myopic Socrates turned his "one great Cyclops eye" on tragedy, "an eye in which the fair frenzy of artistic enthusiasm had never glowed," and shunned it (p. 89). According to Nietzsche, Socrates found tragedy neither true, nor beautiful, nor (for that matter) useful. The "artistic enthusiasm" that in Nietzsche's view, Socrates did not know and Plato later would not countenance Nietzsche honors because he believes it both reflects and best captures life: "for life is based on semblance, art, deception, points of view, and the necessity of perspectives and error" (p. 23). Already we sense the doctrine of perspectivism, which claims that there are "no facts . . . only interpretations" (1968, 267).

In later works, Nietzsche joins together the artist and theorist, as it were, claiming that criticism always entails affirming and creating: "We can destroy only as creators" (1974, 122). Nietzsche's objection to the "theoretical man" lies in the latter's denial of this creative aspect of thinking—in Nietzsche's terminology, denial of his will-to-power. Both the artist and the theorist are "critical" (1967a, 93–98), but to Nietzsche's way of thinking, the artist is more so because

he understands that living necessarily entails both interpreting and affecting the world and therefore acknowledges and creatively directs his will-to-power. The theorist who emulates the artist, Nietz-sche believes, is less likely to delude others or himself.

The first intonations of Nietzsche's alternative way of theorizing are found alongside this critique of Socrates when he celebrates the dramatist who possesses sufficient power to transform himself and speak out of the bodies and souls of others (1967a, 64). This foreshadows Nietzsche's affirmation of the philosopher "who has traversed many kinds of health, [and] has [thus] passed through an equal number of philosophies" (1967c, 96; 1974, 35). Nietzsche's appreciation for this dramatic talent—"to see oneself transformed before one's eyes and to begin to act as if one had actually entered into another body, another character"—prefigures perspectivism (1967a, 64; 1974, 132–33). The dramatist's talent is the raw material for new thinking habits.

Nietzsche persistently uses corporeal and sensorial metaphors, often unconventional ones, to describe and distinguish various ways of thinking.8 This poses the question of why, when faced with the "need for a new world of symbols," he, like the Dionysian, called "the entire symbolism of the body into play" (1967a, 40). I suggest that thinking through the corporeal registers Nietzsche's alternative way of theorizing. If, as he claims, "perspectivism is only a complex form of specificity" (1968, 340), Nietzsche's use of the body is a potent way of attending to the locality and effects of thinking. He continually transfigures the body, often by telling the story of his own body, taking all the senses and bodily processes together, playing them against-and with-one another, to convey the constitution and transformation of viewing and thinking alike. Perspectivism is thinking incorporated and analogized by embodied, power-responsive vision.

Speaking generally, will-to-power secures the beliefs of, and practices fostering, a way of life (Nehamas 1985, 74–105, 141–69). I use the word *location* for this amalgamation of embodied habits and beliefs. Will-to-power is relational and its effects are engendered by simply living our locations, by our body's ways of being in the world. Consequently, location should be thought of not as a place, but as a space which is continually changing with how it is linked at any given moment to other locations. In enacting these spaces for ourselves, we are inevitably engaged (whether we are aware of it or not) in challenging other locations or in suppressing and destroying them altogether. The views and practices that prevail in a body politic reflect and reinforce patterns of congealed will-to-power. These often invisible patterns are generated by "governing powers" manifest in the norms, practices, and efficacy we bring to bear upon our own and others' conduct (Foucault 1983, 212-26). These powers are not exercised exclusively by government but are borne and extended by subject-citizens and evinced by the traces they leave on

the surface of all to which their *bodies* and activities relate them (Foucault 1977, 165–96).

Even when shared ends bind us to others, differential effects, fashioned by disparate histories, come into view because we carry interpretations attesting to the particularities of our body's manifestations and requirements. Our pursuits resonate with, extend, resist, or are stifled by force fields across a body politic. Conflicting, unequal effects are continually manifest in subject-citizens' mutual relations and engendered by their relation to norms, the will-topower that accrues with them, and the psychological and material consequences that flow from this positionality or location. Our capacities and efficacy are increased or decreased by our degree of conformity to the norms embodied in civil codes even though we do not possess these powers but bear them. Our efficacy is contingent upon our ability and willingness to flow with them. In doing so, we may have harmful effects upon others who are differently aligned in relation to extant patterns of will-to-power. As a result and with our aid, selves and world are made pliant to some persons and projects, recalcitrant toward others. For instance, our body's appearance (e.g., how it carries "race" and "gender") calls forth responses from others and also has (often unintended) effects upon other bodies and the worldeffects that emanate from the activities and the ends that it "needs," demands, or is "empowered" to acquire. All of these are a manifestation of our unavoidable will-to-power, of which Nietzsche says, "This necessary perspectivism by virtue of which every center of force . . . construes all the rest of the world from its own viewpoint, i.e., measures, feels, forms, according to its own force" (1968, 339). When we deny our will-to-power, we ignore the effects attending the perpetuation of our bodies and locations in the world—in which case, politics and culture become matters of thoughtless assertion.

If our thoughts and bodies are so bound, it does not necessarily follow that thinking therefore can only reflect our body and its interests (as so many have concluded it does). Thinking, especially when we attend to location (the continually changing space in which our body appears) can enable us to alter our "interests" and effects, though we cannot altogether transcend them. While we may be beings who are always becoming, we are nonetheless subject to patterns of will-to-power—to specific habits and related limits of perspective—that elude our thinking when we are without the aid of perspectivism and (albeit to a lesser degree) even when we avail ourselves of it. The corporeality of Nietzsche's thinking conveys the weight of the world and our bodies while avoiding determinism (Nietzsche 1967c, 129; see also Blondel 1991, 201-38). The genealogist understands the willto-power that inscribes and incorporates preponderant dispositions and habits, but the genealogist also knows that there is a degree of contingency (and thus human agency) within processes of inscription and incorporation that hold out the promise of alterability (e.g., Foucault 1977, 148-64). Nietzsche thinks corporeally to convey both the possibility of transfiguration and the weight of all that is poised against it.

Philosophers, Nietzsche believes, have traditionally been predisposed to disregard the *body* or to neglect its role in thinking. ¹⁰ He identifies the root of this "peculiar philosophers' irritation at and rancor against sensuality" in the ascetic ideal (1967c, 106). Philosophy's asceticism forecast the conception of thinking that it valorized. The ideal that affirmed "voluntary deprivation, self-mortification, self-flagellation, [and] self-sacrifice" also sought to "contemplate without interest" (pp. 118-19). Nietzsche regards the effort to do away with interestedness and the body as an attack upon thinking, because to conceive of a thinker who contemplates without interest demands thinking of a disembodied eye "turned in no particular direction, in which the active, interpreting forces, through alone which seeing becomes seeing something, are supposed to be lacking" (1967c, 105, 118-19). The objectivist's denial of thinking's creative aspect and interested character ends in the atrophy of thinking, when the "objective man" (the "philosopher," as well as his heir, the "scientist") takes "mirroring" as his ideal and submits to "whatever wants to be known" (1973, 115). Mirroring, the suspension of "interestedness," is actually a refusal that eventually becomes an inability to think. Contemplation without interest, like "all great things [that] bring about their own destruction through an act of self-overcoming," ends in interest without contemplation and, at bottom, in meaninglessness, nothingness (1967c, 157, 161). As we shall see, to think without interest or will-to-power is impossible, in Nietzsche's view, because to think without interest is ultimately to be thoughtless (pp. 103-6; 1973, 131).

Perspectivism represents Nietzsche's revaluation of the relationship between mind and body, thinking and power; it is "interestedness" transformed through thinking. The perspectivist, by bringing other views to bear upon habits and beliefs, heightens attention to the limitations engendered by a particular location. What is unthinkingly accepted or enacted may become unsettled by incorporating alternative views. The relationship between thinking and power is also transfigured, for perspectival thinking is not subject before will-to-power or merely a vehicle for expressing "interest." Rather, will-topower is potentially transformed through thinking, and the latter, in turn, may be ennobled by the power of others' perspectives. Nietzsche reconceives "objectivity" in his penultimate expression of perspectivism: "there is only a perspective seeing, only a perspective 'knowing'; and the more affects we allow to speak about on thing, the more eyes, different eyes, we can use to observe one thing, the more complete will our 'concept' of this thing, our 'objectivity' be" (1967c, 119). The "definition" or "essence" of anything, Nietzsche maintains, is finally an opinion about a thing and an effect of interpretation (1967c, 79-81; 1968, 301-2). Nietzsche's refiguring of "objectivity" resists the epistemological commitments of discourses structured in accordance with a monologic truth. Instead, he favors thinking as the incorporation of multiple and diverse views in pursuit of fuller opinion, the proliferation of meanings, and the sustenance of a plurality of perspectives. Will-to-power thereby becomes less reactive and impositional, more thoughtful.

When Nietzsche narrates the expansion and change of his bodily processes and senses, he is figuratively conveying his effort to alter his views by thinking or incorporating other perspectives. Bringing "many eyes" to bear on any one thing requires "the ability to control one's Pro and Con and to dispose of them, so that one knows how to employ a variety of perspectives and affective interpretations" (1967c, 119). Nietzsche's discussion of brief habits begins to suggest (we will need Arendt's perspective to understand more fully) how we may come to critically evaluate and transform our locations and their effects, if never altogether surpass them. Nietzsche loves brief habits because he considers them "an inestimable means for getting to know many things and states, down to the bottom of their sweetness and bitternesses" (1974, 236-37). To appreciate something, one must experience it with a passionate faith, with the belief that one has found the thing that will provide lasting satisfaction. This is so because "untruth is a condition of life" (1967a, 23; 1973, 17). It is not merely a matter of not being able to subject all of our beliefs and habits to criticism all at once. Even if one could, to do so would be prohibitive. Immersion in the world and (at least temporary) partiality make seeing and thinking possible. Affirming one's historicity is a condition of new thinking and action (e.g., Warren 1988, 192–94).

Either a life of enduring habits or one without any habits at all, according to Nietzsche, would prove inhospitable to thinking. On the one hand, a life of enduring habits is monolithic and without variation; the new, the original, and the many (and thus a plurality of perspectives) are its definitional antitheses (1954, 639). One may become identified with one's location until its perspective is all that one knows; and then, what is habitual is regarded as unalterable. On the other hand, a life without habits precludes the digestion and incorporation of experiences (1983, 62). Regarding one's life as a performance of "perpetual improvisation[s]" ceaselessly seeking to evade the habitual is predicated on an inability or unwillingness to discern the effects that accumulate with one's location in the world (1974, 237). Moreover, to resist or deny one's habits and the "materiality" of one's location is to overlook how will-to-power and its effects not only limit vision but may also enhance it. Perspectivism requires one neither to live one's body and location thoughtlessly nor to believe that they are so plastic as to be transformed at will. Rather, it calls for altering "who" we are or how we bear the effects that accrue with "what" we are (or our embodied location in the world) first by striving to recognize their potential brevity. 11

Learning to love and desire something is to turn it into a habit. Like Socrates, who found eros and thinking inextricably bound, Nietzsche maintains (though with different effects) that "all great problems demand great love," love being something that one must learn by first (often with difficulty) detecting and distinguishing something and then "tolerat-[ing] it in spite of its strangeness" until it finally becomes a part of who one is: by offering hospitality to what initially appears strange, we learn to love and to think (1974, 262). Both require responsiveness to "strangeness"—a willingness to acquire new habits or (at the very least) to have one's own habits questioned. Brief habits are kept from becoming thoughtless truths when we incorporate views that open up the possibility of transfiguring our ways of life.

The love that one feels for one's problems is indicative of a personal relationship to one's thoughts (Nietzsche 1974, 283). Personal thoughts threaten to become cold and impersonal when they take on the appearance of unassailable truths and their temporal specificity and emanation from particular locations and lives is no longer palpable (1973, 201). Such truths simultaneously attest to the power and impotence of thinking; to the destructive yet compelling character of its deracinated forms. Boundless thoughts and the beliefs and habits that appear to command universal assent or consensus are remarkably potent: they rule minds. The individual mind, in its weakness, becomes subject before such thoughts and, forsaking its own, loses a plurality of perspectives. Thinking is at risk if the particulars or habitual character of a thought can no longer be fathomed. There is danger in brief habits becoming "immortal truths" (Nietzsche 1973, 201; see Arendt 1971, 435; idem 1978, 176). When the latter congeal, we approach nihilism.

OUR NIHILISTIC POLITICAL CULTURE

Thoughtlessness is a primary aspect of what Nietzsche calls nihilism. Nihilism exists when there is a predominant sense either that everything is permitted because there is no basis for choosing between things or that all such bases are arbitrary, in turn possibly leading either to resignation and the feeling that all is meaningless or to an aggressive indifference. One of nihilism's chief effects is a crisis in human action (Warren 1988, 13-45), a dissipation of thoughtful efficacy. We are thoughtless when we do not or cannot conceive or recur to the effects attending the perpetuation of our locations in the world. The consequences of doing so are enormous. When the contours of a particular life and location are not perceived because the bounds of one's views are not within the purview of thought (Nietzsche 1973, 114-16), then what is actually bound and limited will appear boundless and rule one's mind. Indeed, if one's way of life is a prevalent one, these views receive confirmation everywhere one looks and will appear commonsensical. A unitary perspective prevails by virtue of our incapacity to rejoin what is strange, challenging, or invisible to us.

Another consequence of such thoughtlessness is a return of the repressed. Will-to-power, once denied, now may appear everywhere and seems to overcome thinking. This situation is often precipitated by those whose views are dismissed or elided when prevailing yet limited views are represented as boundless; "genealogical" cultural criticism documents the will-to-power evident when particular perspectives on the world mask themselves as universal or commonsensical. Such critiques are often regarded as an assault upon the possibility of "objectivity" however conceived. This is the state of affairs characteristically named "nihilist" (and "Nietzschean") in the United States (e.g., Bloom 1987, 141–240).

Thus, the contemporary intellectual, cultural landscape appears to be divided among distinct camps. 12 On one side, are "traditional" philosophers and scientists, who maintain that one who thinks can surpass interest, that is, break the ties that bind thinking to power. (The latter is sometimes equated with domination and coercion, more often with the "subjective" and "irrational.") Indeed, to transcend will-to-power and to dissipate or dispel interest are thought to be among the chief characteristics and virtues of thinking (which, in this case, is usually equated with knowledge). The political outlook corresponding to the perspective of this first camp holds that faction and differential effects can be exceeded and neutral or reasonable ground (whether scientific or moral), found or created. 13 Critics of the first camp maintain that thinking is inextricably bound to, and serves, will-to-power (albeit in sophisticated and convert ways). So far, this second camp has tended (though need not necessarily) to view politics as a battle of competing interests with outcomes determined by their relative strength.14 Perhaps more often, a reconciliation of the first camp's "contemplation without interest" and the second camp's interest without contemplation is sought in some notion of "enlightened self-interest" when expert knowledge or mature, "postconventional" reasoning provides the thoughtless ego with its "real" interests, again with the danger of shielding thoughtless assertion behind claims to "knowledge" or "rationality." ¹⁵

From the perspective afforded by (if not always propounded in) Nietzsche's writings these philosophical and political positions may be judged dogmatic, if in different ways. Together, those who claim that thinking can transcend will-to-power and those who claim that it is simply a vehicle for it (if anyone truly holds the latter view) abet our nihilistic political culture. What each denies (or insufficiently explores) is the capacity of thinking to transform will-to-power without pretending to surpass it. By contrast, Nietzsche denies neither thinking's proximity to will-topower nor the capacities of thought. He affirms the possibilities of thinking in a world saturated with will-to-power's effects. On this understanding, Nietzsche's perspectivism provides us with a way of conceiving the interrelationship of thinking and power

that does not allow the ascension of either term but facilitates the fullest understanding of their unavoidable, and potentially affirmative, interdependence. Political theorizing attends and responds to will-to-power. Perspectival thinking entails recognition of both how one becomes "what" one appears to be and to what views one's location gives inclination, combined with a facility for incorporating alternative perspectives and thus for transfiguring "who" one is becoming.

PLURALITY, COMMONALITY, AND POLITICAL SPACES

Nietzsche is not a political theorist. His interpretation of nihilism indicates its cultural and collective sources but without due or satisfying attention to its political aspects or preconditions. In my view, he disavows that nihilism can be collaboratively alleviated. He surveys modern culture from his particular location within it and determines that few, if any, practice the thoughtful self-transfiguration he esteems. He may be right, though he does not tell us why most appear to be incapable of this thoughtfulness, enhanced vision, honesty, and courage before themselves and the world.¹⁶

Hannah Arendt regarded modern thoughtlessness from a different perspective. Though this principal concern of her work is most conspicuous after Eichmann in Jerusalem (see Arendt 1964, 1965, 1971, 1978), her intuition about connections between reflective capacities and political possibilities is evident much earlier (Arendt 1951, 1953, 1958). On my understanding, Arendt's insight is that thinking (or, negatively, thoughtlessness) is conditioned by the configuration (or absence) of political spaces and by the availability and quality of specifically political power. While both Nietzsche and Arendt value and presuppose plurality, they have quite different views of its relationship to political commonality. For Nietzsche, the latter threatens plurality and thus his (anti)political opinions. By contrast, Arendt believes that the appearance of plurality and its worldly effects become manifest through politically constituted commonality. For Arendt, the ascendance of a unitary perspective (which she, like Nietzsche, associates with nihilism [Arendt 1971, 435]) and the destruction or imperceptibility of a plurality of views are linked to the absence of distinctly political spaces and the political commonality they potentially promise (1958, 58). The appearance of the plurality that Nietzsche values is, in Arendt's view, impossible without political spaces. Yet Arendt often imagines these spaces (I think mistakenly) as necessarily surpassing the demands of the body or "what" we are. We need both of their perspectives, altered by mutual transfiguration, to conceive political perspectivism. The challenge for political thinking is to suggest how commonality may be politically constituted while recognizing that all such political instantiations themselves are manifestations of will-to-power's effect. Additionally, we need stories telling how these effects may be politically addressed without devolving into thoughtless assertion, that is, without either denying that such effects repose in thinking or simply exercising them thoughtlessly.

According to Arendt, contact between human beings facilitates the appearance of both commonality and plurality. Where people speak and act together politically, such spaces engender and sustain whatever perception of commonality we achieve (Arendt 1958, 50, 52–53). This in turn facilitates recognition of our distinctness from other persons and the revelation of individual uniqueness or "natality" (pp. 49, 175-76, 178). Paradoxically, the perception of commonality creates boundaries, or at least a capacity to recognize boundaries as well as connections between oneself and others (p. 52). If political commonality is absent or unimaginable, then not only what we potentially share with others but also what distinguishes us from them (our distinct perspectives upon and locations within the world) become precarious (pp. 57-58, 199). Whatever assails the possibility of political commonality menaces plurality and vice versa. This is Arendt's view of our greatest threat; for "mass society not only destroys the public realm but the private as well, deprives men not only of their place in the world but of their private home" (p. 59). Perception of commonality in the world needs the presence of a multiplicity of perspectives that despite their diversity create and confirm its sharedness (pp. 57-58). "The end of the common world has come when it is seen only under one aspect and is permitted to present itself in only one perspective" (pp. 39, 58, 220). While political spaces create commonality, we each have our different locations in the world and our views are a mixture of "who" we are as revealed in such spaces and the distinct locations that condition "what" we appear to be. Different locations afford differentiating perspectives on a common thing (p. 57). Political commonality enables this plurality to

Arendt is notorious for advocating a hard-and-fast boundary between matters public and private (Arendt 1958, 22–73, 192–220) in the interest of preserving the distinctness of political commonality from "biological sameness." Through political action, we leave behind (or silence for a glorious moment) the necessities of "biological life process" and "what" we are in exchange for freedom in the public world. When she speaks in such terms (and she does not always), Arendt's political theory has a rarefied quality that obscures its relevance to modern liberal democratic polities in which people seem preoccupied with their bodies and interests. But the boundary Arendt draws between public and private matters is eroded by her own insistence on the intrinsic import of plurality for the actuation of political commonality. Plurality is indispensable to the emergence of specifically political spaces and the contour and character of our locations begin plurality's content. Though contrary to some of her most explicit views, Arendt's emphasis on plurality suggests that one's private location and *body* ("what" one is) weigh upon "who" one is revealed to be in political spaces.

Arendt neglected the interrelationship between bodies, locations, and specifically political power, because, unlike Nietzsche, she conceives the body as politically irrelevant. This is in part because Arendt treats the body and its "necessities" as univocal and unalterable (e.g., Arendt 1958, 46, 111-12, 119, 123; 1978, 22, 29, 33, 35, 44), rather than—as Nietzsche maintains—contingent (if weighty), culturally and politically inscribed (sometimes even arbitrarily), and thus contestable and politically significant. Nietzsche recognized that the body as we know it (and as Arendt assumes) appears as an undifferentiated mass, but he also maintains that "the welding of a hitherto unchecked populace into a firm form [like Arendt's "mass society"] was not only instituted by an act of violence but also carried to conclusion by nothing but acts of violence" (1967c, 86). As we are incorporated into such a "firm form," our perspectives are, at least in part, attributable to our different bodies and locations, our habits and beliefs, and their relative effects. 17

Discerning "what" we appear to be—our bodies and private locations—is therefore not irrelevant to, but a prerequisite (if not sufficient) for political deliberation and action. Histories of our locations may offer a critical purchase on Arendt's undifferentiated "mass society" and thereby facilitate the appearance of a plurality of perspectives. Without thinking about and being responsive to such particularities, we lack the basis for a differentiating perspective, one among the many that Arendt says are required to create and assure political commonality (1958, 58-65). Likewise, when political spaces are absent, the distinct perspectives that one's location(s) allow become indiscernible and, again, both plurality and commonality are at risk, and with them political agency and the capacity thoughtfully to affect the conditions of one's life. Absent political commonality and the plurality of perspectives accompanying our different locations, we may lose our world, figuratively and literally (1951, 135-47, 269-302, 460-79; 1958, 57-61, 208-9). Perhaps Arendt discounted the political relevance of "what" we appear to be because she, like Nietzsche, held such a sobering view of how human beings secure their ways of life.

TRESPASSES AND POLITICAL ACTION: HOW ONE BECOMES WHAT AND WHO ONE IS

How do we forge the locations which begin plurality's content? Our locations are *made* as we master necessity by means of force, coercion, and even violence, toward nature and other human beings (Arendt 1958, 31, 129–30, 140). In Arendt's view, necessity, and therefore compulsion, persists (though in modernity it is increasingly hidden) wherever hu-

man life is sustained (pp. 121, 125, 130, 135). The satisfaction of human, bodily needs—needs for food, shelter, and leisure (among other things)-includes compelling nature, oneself, and others to bear the burdens of life. For the most part, in mastering necessity and fabricating locations, "making" is the relevant mode of activity and it is an indispensable manifestation of the vita activa (p. 136-74). But making, as principally a matter of poiēsis, consists in the mastery of others and oneself; thus, an element of violation—and potential violence—inheres in all fabrication (pp. 139, 194-96). By itself, making creates a world where necessity and compulsion, not freedom and political action, predominate and with destructive repercussions for human relationships (pp. 195, 220-30, 233-36).

The means by which each location is made—and, in turn, is affected by others' locations—affords each some of its specific character and commences its differentiating perspective on the world. While Arendt's reflections on the "private realm" tend to represent location as a singular place or "home" her notion of trespasses belies this narrow understanding (1958, 28–37, 58–67, 236–243). Through our activities, we insert ourselves into a weblike world. Through our words and deeds, whether in political space or some other, we make a world, disrupt what precedes us, and may initiate something altogether new (pp. 8-9, 188). When we forge our locations, we trespass against others (p. 240). Her reflections on trespasses show Arendt, like Nietzsche, to be a theorist of will-to-power.

Trespasses are not "radical evil" but signify its everyday variety and they adhere in the very nature of the vita activa's establishment of new relationships (see Arendt 1958, 240-41; idem 1971, 438). Trespasses are effects that one cannot undo oneself, and they occur under circumstances where one did not, or could not, have known what one was doing. One may not have known what one was doing because the effects of human activities cannot be predicted (1958, 188-92). It is the nature of these activities to exceed our intentions and plan because we share a world we did not make with other human beings who are also makers and actors (1953, 389; 1958, 184, 190). Moreover, we are not responsible for "what" we are-how and what we have been "made" to be by history, institutions, and patterns of power that preceded us and for which no one person alone is responsible (e.g., Nietzsche 1954, 500–501). We may become responsible, however, for "who" we are, that is, for how we bear the will-to-power that accompanies "what" we appear to be.

It is unlikely, however, that we can become responsive to our will-to-power without political spaces, for when we trespass we also may not know what we are doing because we often cannot recognize the effects of our *bodies* and locations without the benefit of others' perspectives. One must learn about these effects from others, usually in the form of a story told about or from the perspective of those others whom one effects. Until then, one's effects and actions

(though they are apparently one's own), may remain largely unseen or unacknowledged. "Who" we are only appears to us in the form of an unending story told by others (Arendt 1958, 181–88; Nehamas 1985, 163–69) and is distinguished from "what" we appear to be by how we bear and transfigure the effects of our will-to-power. But we can do so only in political spaces where we act in concert with others because our *trespasses* are extended by patterns of power that we alone cannot change.

The distinction between "necessity" and "freedom," "making" and "political action"—so crucial to Arendt's political understanding—turns on the degree of articulation in the latter term of each pair. Freedom and political action define spaces where we "answer," "talk back," and "measure up to" what has happened or what we have done, the effects of our location in the world (Arendt 1958, 26; idem 1982, 41). Necessity and making define relations that are leveling, forceful, and unresponsive. When necessity and making reign, as they typically do in the daily (nonpolitical) fabricating of our locations, we simply have effects upon others and receive their effects upon us; neither we nor they are called to answer for them. Will-to-power is exercised thoughtlessly. Combative, not collaborative, action prevails.

By contrast, political spaces both may provide ways of reckoning the necessity that reigns outside and may be carried into political spaces. ¹⁹ In Arendt's view, the "ruling and being ruled" typical of making (and which likewise inform modern understandings of politics to the extent that we confuse it with "governance" and its powers) are "prepolitical," because they are relations of necessity, rather than freedom—of making, rather than political action (Arendt 1958, 220–30). The public or private character of relations is less decisive for their being political or nonpolitical than is whether we fathom and respond to our effects upon one another and open them to specifically political deliberation and action. "Who" we are may be judged estimable when we become responsive in this way.

On this understanding, politics is not so much a realm or sphere we enter into as it is a form of relation we undertake. Political spaces do not simply reveal or provide a means of furthering our will-to-power. Rather, in them we encounter others who call how we bear its effects to our attention, and we may do likewise. We constitute political relations and create the possibility of political commonality when we think together about the ruling and necessity—compulsion and violation—that dwell in all "making," whether they become manifest in individual acts, social behavior, or governance. Indeed, if we do not, spaces of cooperative action are undermined then destroyed by thoughtless assertion. In political spaces, we have the opportunity to deliberate—to discern and answer for our effects and, at least potentially, to transfigure them by means of the political power generated when we act in concert. When we associate politically, we enact perspectivism and thoughtfully direct our will-to-power.

TRANSFIGURING THE BODY OF THE POLITICAL ACTOR

It remains to be seen, however, exactly how political deliberation reveals and, most importantly, transfigures our distinct perspectives. How does perspectival political thinking help us to come to see the *trespasses* (unknown, unintended, thoughtless effects) that "made" our locations and the collective histories of which they form a part? How does it facilitate our acting in concert so that we can generate the collaborative power needed to transfigure our assertive effects and the patterns of solidified will-to-power which embolden them? In my view, Arendt's most suggestive formulation follows, in which she conceives political thinking as "representative":

I form an opinion by considering a given issue from different viewpoints. . . . This process of representation does not blindly adopt the actual views of those who stand somewhere else, and hence look upon the world from a different perspective; this is a question neither of empathy, as though I tried to be or feel like somebody else, nor of counting noses and joining a majority but of being and thinking in my own identity where actually I am not. (1977, 241)

Political thinking imagines other views. But what is Arendt practically endeavoring to describe? The Kantian notion of "enlarged mentality" on which Arendt draws in this and related passages (e.g., 1977, 197-264; 1982, 44) has become a popular locus for efforts to conceive political judgment. The virtue of Arendt's rendering of this idea, at least when we read it with eyes transfigured by Nietzsche, is that she does justice to its difficulties. Too often, the imperative and possibility of regarding matters from another's point of view or of "reversing perspectives" are simply presupposed. Though Arendt, following Kant, often invokes forgetting the *body* and "what" we are as the goal of such reflective activity (e.g., 1978, 30-45, 1982, 54), Nietzsche's refiguring of the relationship between body and mind-power and thinking-counsels against it. The goal of perspectival political thinking is not to exceed will-to-power but to transfigure it into the collaborative power we need if we are thoughtfully to (re)direct our effects. Read in light of the shadows cast by Nietzsche, Arendt's formulation suggests just how difficult matters can be when we endeavor to grasp another's perspective so that we can act together. She helps illuminate such political thinking by first telling us what it is not.²⁰

First, representative thinking is not empathy ("as though I tried to be or feel like somebody else"), for it shares the vices of enlightened self-interest (Arendt 1965, 73–94; idem 1982, 43). Like "contemplation without interest" it is founded on the myth that one can consciously suspend "what" and "who" one is and adopt a viewpoint independent of interpretation. The fallacy that one can simply adopt another view is also thoughtless, like interest without contemplation, because another perspective is gained without thinking. In the course of doing so, an act of interpretation

has been performed, but the denial of this fact almost assures the interpretation's arbitrary content. When one presumes to adopt another perspective without reflection on the boundaries of one's own body and location, more often than not one simply imposes the view from there upon another. Indeed, this is a principal way of bolstering one's location and demonstrates the effects involved in doing so. In such cases, one's own view arrogates another's and thus threatens to violate or do away with it altogether.

Neither is representative thinking, according to Arendt, a tally of viewpoints whose calculation results in a majority "perspective." This is the case for two reasons. First, it it so because, like interest without contemplation, amassing multiple perspectives into a single view is an abdication of thought and evaluation. Here the value of a view depends upon its strength or numbers, and politics as a battle of competing interests is thoughtless. Second, and relatedly, this means of creating one perspective from many does not represent a full view (an aspiration toward as comprehensive a view as possible) but the imposition, again in an arbitrary manner, of a univocal view. Political commonality is confused with the ascendance of a monologic truth or consensual perspective. Such thinking is neither "representative" nor political because the viewing of commonality in only one aspect (as we saw earlier) ultimately threatens to obliterate the world in which we appear and act politically. According to Arendt, the creation of commonality depends upon the preservation of a plurality of views. A representation of what is common that forgoes this plurality of perspectives and obscures or destroys each differentiating relationship to it threatens to render both our locations and world indiscernible.

The key to Arendt's alternative and, by implication (I am contending), an elaboration of the political theoretical significance of Nietzsche's perspectivism, is the idea of "being and thinking in my own identity where actually I am not." How does one, like Nietzsche's dramatist, enter into other bodies, other characters? Arendt may be read as trying to convey a precarious balance—the preservation of one's own perspectives and political thinking capacity while incorporating another's view. Political deliberation and action should not result in the obliteration of the perspective—or an assault upon the location—of any participant. When they do, neither thinking nor deed are political but bear a greater resemblance to "making." The mastery of another's perspective is anti-thetical to the "answering" and "measuring up to" the perspective of another definitive of political relations. Political thinking may require the alteration of both one's own perspective and that of another but the total loss of neither.

The effort to think from another's perspective may change "who" I am—my location and how I live it. Our location is the sum of our effects and, by implication, the sum of all that effects us (Nehamas 1985, 74–105). It consists of our habits and beliefs and the sway of the world and its other inhabitants upon how

we live them. To think another perspective—to endeavor to conceive another location-even if ultimately to refuse it (and no doubt we often will), entails some acceptance of that perspective. When comprehending another view, one incorporates it into what one can imagine and seeks to envision one's location from another's perspective until, finally, it may transfigure what that location is. Equally, in this responding to the view of another, the location and perspective one encounters may also be commuted. One's own perspective and another's mix to form an original combination, a new perspective on the world and an alteration of the plurality of locations that sustain both it and whatever political commonality we achieve. If one has actually come to conceive another view and to answer to it, one's habits and beliefs—one's own body and location may never again be lived in quite the same way. 21 To think from the vantage of another, to respond to the perspective born of their location, and to measure up to the relation of your location to it may call for changing "who" you are. Political deliberation offers the world a modified view of another location mixed with "who" you are, thus transfiguring "whom" you and they appear to be, as well as "whom" you and they are becoming.

When we think and act politically (and admittedly, on this understanding, it is rare indeed), we come to recognize the distinctness of our bodies and locations and the perspectives they afford in contrast to the perspectives of others. The manifestation of such a plurality of views is not a "thought experiment" (Benhabib 1992, 158-70) but requires actual encounters in political spaces among persons and their differentiating perspectives. Most importantly, these perspectives, which become manifest through political deliberation and transformed by political power, are born of differential effects of compulsion, force, and violence, which both emerge from and shape our bodies and locations. Each of us carries such effects, whether or not they become manifest in a political or nonpolitical space. But a space becomes political when one's perspective ceases to be thoughtless assertion and becomes a location with effects upon others for which one answers and to which one thoughtfully responds. Political thinking enacts perspectivism. We think theoretically when we attend, and respond to will-to-power. Therefore, thinking is not antithetical to political action but is its precondition. One need not be a philosopher to think; each of us may become capable, with the aid of others' perspectives, of discerning our effects-responding to and transfiguring them. We think and act politically not only (or perhaps not even primarily) when we give strong arguments to justify or "woo acceptance" of our locations and perspectives (Arendt 1982, 72) but when we open ourselves to others' perspectives with a willingness to transfigure "who" we are becoming. 22 Such responsiveness is a condition of the action in concert that generates the collaborative power needed to transfigure our effects and the patterns of power that amplify them.

We cannot reach this understanding of political perspectivism by reading either Nietzsche or Arendt alone. Rather, their views must be brought to bear upon one another to facilitate a mutual transfiguration and the appearance of a new combination, a different perspective. Efforts to preserve Nietzsche's philosophical achievement that neglect his perspectivism or render it as entailing no necessary political preconditions are likely to fail, in my view, because they finally offer no alternative to a vision of politics and culture as a battle of competing interests with outcomes determined by their relative strength and tend to ignore or conceal the assertive effects that remain even when we endeavor to enact perspectivism. If perspectivism is to be actualized or to avoid repugnant forms, it needs to be joined to political theorizing that surmises how we may come to recognize and thoughtfully transfigure our perspectives and assertive effects in response to others and (as I will suggest in a moment) why we might become willing to do so. Arendt's writings are one potent resource for such an understanding, but they too need transfiguration. Arendt (1958) maintained that we could lose our "common world," figuratively and literally, and indeed she presciently regarded this to be increasingly our condition. But her views about the relation of mind and body-thinking and power-prevented her from fully elaborating the ways of thinking that might facilitate political spaces and collaborative power. The imperative to surpass "what" we are can amount to a willful neglect of the effects that, if unattended to, may destroy the world and our capacity to act in concert. Only perspectival political thinking, which discerns our bodies and locations and their effects, and which is the precondition of political action responsive to them, can begin spaces where plurality appears and political commonality may be constituted.

CONCLUSION

To what extent commonality and plurality (or diversity) can and should be balanced (or each sustained) remains among the most pressing and virulently debated questions in contemporary American political, social, and cultural life. As posed, the issue is a false one. Both plurality and commonality presuppose and need one another. Politically constituted commonality affords the only hope of preventing the destruction of diverse perspectives. Plurality can only be preserved through political spaces where we discern, answer for, and potentially alter the effects of will-to-power which threaten to suppress or destroy particular locations and the perspectives they engender. Absent specifically political deliberation and power, plurality is overcome in a contest of strength by a unitary perspective or by the absence of any perspective at all. Likewise, commonality needs plurality if it is not to devolve into thoughtless assertion. When not sustained by such differentiating perspectives, commonality becomes narrower and more exclusive, that is, increasingly less than common and therefore rejected or assaulted by those whose views have not given shape to it. Only when commonality is created through political deliberation and action that preserve each differentiating relationship to it can what is regarded as common actually be shared—and even then only partially and provisionally.

Political spaces can be created and maintained, however, only if we seek to restrain and redirect our will-to-power. The fact that genuinely political spaces are so rare and usually so short-lived tells us something about our ways of being in the world (see Arendt 1965, 215-81). Will-to-power is unavoidable and intrinsic to human living. The decisive issue is whether or not we direct it thoughtfully. Thoughtless assertion destroys political spaces and, with them, both commonality and plurality. It is tempting, I suppose—given the entrenched view that will-topower poses a threat to thinking and, relatedly, that legitimacy is secured by surpassing contestability—to conclude that the only way to create commonality is by deprecating our different bodies and their interests in order to affirm what we are believed to share, whether that be a minimalist aversion to the outright hostilities that unbridled difference is feared to portend or more substantive communal or rational ideals. But that strategy is bound to fail because, most often, it is our different locations that make demands upon others bodies and the world-demands that threaten to destroy those locations and perspectives and thereby obstruct the constitution of what is shared. It is not plurality's very existence that precludes our acting and deliberating together to politically constitute commonality. Such efforts are undermined by our failure to respond to the claims about will to power which different perspectives pose.

Without encountering and responding to others' challenging perspectives I may not even recognize how "what" and "who" I am erodes political possibility and, in turn, endangers a plurality of perspectives of which mine is one among many. Much stands in the way of discerning those effects and becoming willing to answer for and transfigure them-for example, incommensurability or the incommunicability of certain forms of harm, intractable hostility and distrust, want of courage and fear of relinquishing security. But if and when we do recognize and become willing to transfigure the effects of our willto-power, they cannot be altered by our efforts alone. Trespasses come with simply living our bodies and locations. They are an effect of activities that preceded and constituted us—of histories, institutions, and patterns of power we alone did not makethough our words and deeds reinforce and extend trespassess. We must act with others if we are to alter them, and even then our success, no doubt, will only be partial. Every political instantiation or constitution of commonality has effects such that, if commonality is not to deteriorate into thoughtless assertion, it requires a continual willingness to deliberate, to listen and respond to others' claims about our effects, and (possibly) to modify them. We will always need

politics, not because everything is finally determined by a contest of strength but precisely to constrain and redirect thoughtless assertion into the thoughtful exercise of will to power.

From where do we acquire the energy and inclination to become political perspectivists? Why would we take this leap of faith? When we understand that if we do not, plurality is threatened and with it the meaning and existence of our agency, distinct location(s), and world. The will-to-power embodied in our words and deeds may so harm others as to threaten to obliterate the differentiating view they have—one among the plurality that the constitution of political commonality requires. The existence of political spaces that foster the distinct views engendered by my location in the world—and thus the maintenance of that location-calls for the perspectives of "others." Without their views, the uniqueness of my own views will not appear. Unable to discern the particularities of my own body and location, I will be unable to constitute political spaces with others where my perspectives—and the location from which they emerge—can be revealed and sustained, if transfigured.

Notes

Thanks to Peter Euben, Lisa Frank, George Kateb, Alexander Nehamas, Michael Rogin, Alan Ryan and, more recently, Stacey Alaimo, Nick Burbules, Allen Hance, Natasha Levinson, Jacqueline Madden, Laura Stoker, and Deborah Wuliger for their influences on the argument made here. I benefited too from discussions of an earlier version of this essay at the University of Minnesota and Vassar College.

1. The meaning of body shifts throughout my text, because Nietzsche and Arendt conceive its relationship to politics differently—and neither to my satisfaction. I shall introduce the notion of location to refer to the continually changing space in which our body appears and thus seek to keep in play the body's nonconscious and material, individual, social, and political significances.

2. Kant's Critique of Judgment was Arendt's principal resource in doing so (Arendt 1977, 197-264; 1978; 1982). Numerous commentators have adeptly evaluated the perspicacity and limits of Arendt's view of judgment and of Kant's own, especially in relation to Ariesotelian phronesis (e.g., Beiner 1982, 1983; Benhabib 1992, 121-44; Bernstein 1986, 221-37; Castoriadis 1991, 81-123).

3. Those who bring out the Nietzschean influence often return in the end, with Arendt, to Kant (e.g., Villa 1992) or see that influence as leading away from political action (e.g., Beiner 1982, 153–54). Honig interprets Nietzsche and Arendt as together furthering our understanding of political action 1993, 40–125; but if I read her correctly, she retains something of Arendt's antithesis between "thinking," or "theorizing," and "acting" that I query here (though see pp. 59–60).

4. Exceptions to the common view, though to varying degrees, are Connolly 1987, 1991, 1993; Honig 1993; Kateb 1992, 127–51; Warren 1988. Throughout, I use will-to-power to refer to the effects engendered by human activities. While it is crucial to appreciate distinct and various instantiations of will-to-power (e.g., violence, strength, force, and political power or action in concert [Arendt 1972, 143–46]) these forms of efficacy often slide into one another (e.g., as political power recedes, violence or force often emerge to take its place, pp.

105-84)—hence the need for a general term to represent this continuum.

5. Typically, we take a writer's express views about politics as indicative of his or her political significance. Nietzsche's writings have been interpreted as illiberal or protofascist (e.g., Schutte 1984 and Strong 1988); as without any contemporary political significance whatever (e.g., Nehamas 1985); as advancing an exemplary "agonism" (e.g., Connolly 1991 and Honig 1993). Some truth resides in each interpretation. Yet a writer may proffer a theoretical contribution that exceeds or even contradicts such explicit views. Nietzsche's rejection of moral valuation, which confounds the "cause" of a thing's "origin" and it utility (1967c, 76-81) in effect recommends that we not take his political views (the "origin" of his writings as it were) as determinative of their theoretical "utility." concepts and organisms are a whole synthesis of meanings, and "only that which has no history is definable" (p. 80). Nietzsche has his own views about the value of certain concepts or organisms and judgments about the worthiness of political, collaborative power. He would be the first to admit that these are his own, partial interpretations (1973, 34) and to my mind, these views may be distinguished from perspectivism itself, which embodies his way of thinking. Nietzsche does not respond to a plethora of meanings and their indeterminacy by asserting a single, utilitarian definition; for he regards such monologism as dogmatic (Nehamas 1985, 33-41, 56-57) and nihilistic but attempts (though he does not always succeed) to view the question of something's value from multiple, diverse perspectives. "Value for what?" and "Value from what perspective?" are his leading questions (1967c, 17, 20, 55). They exemplify Nietzsche's perspectivism in its simplest form. Nietzsche is not always the best perspectivist (in part because he neglected, I contend, perspectivism's political preconditions), but that in itself need not discredit perspectivism as a way of conceiving thinking. Bracketing our initial impressions of Nietzsche's political views may be the best way to assess the political theoretical significance of his writings. Engagement with those writings affords a different perspective on what it means to think theoretically.

6. I must ask the reader to resist the understandable but nonetheless unjustified assumption that political theorizing must necessarily be epistemologically grounded in the stricter senses of the term. It is more misleading than helpful to conceive perspectivism as an epistemology, at least as the latter is conventionally construed (Nehamas 1985, 73; Warren 1988, 94). Moreover, Nietzsche and those who have borne his influence reject the dual-world metaphysics upon which a distinction between judging and thinking rests (Foucault 1977, 177–78). Similarly, I speak of "thinking" rather than "judging" because I regard "imagining invisibles" (in addition to perceiving what is "close at hand" or commonsensical) to be both possible while acting politically and a condition of

doing so.

7. They verge on this, for example, when Arendt speaks of thinking as necessarily solitary, a withdrawal from the world, and a forgetting of the body (e.g., 1971; 1978, 22–23, 35, 44–45, 64, 69–80, 85, 92; 1982, 73). While she sometimes qualifies or contradicts these characterizations, her view of the political relevance of the *body* and its largely negative influence on "mental faculties" remains relatively constant.

8. On Nietzsche's use of the body, see Blondel 1991 and also Deleuze 1983, 39–72. For specific examples of Nietzsche's unconventional sensorial and corporeal metaphors, see 1967b, 222–23, 236–40; 1967c, 23; 1973, 55, 126, 134–35.

- Thomas Hobbes is an exemplary theorist of this view.
 We would have to include among them Arendt 1958,
- 1971, 1978, 1982.
- 11. Arendt, following Augustine's Confessions 10, introduces a distinction between "what" and "who" one is (1958, 10–11) that I shall interpretively elaborate. "What" we are represents what appears to be given or beyond the reach of our agency, while "who" we are is revealed through our deeds. Since "what" we are cannot finally be known, the relationship between it and "who" we are is contingent, changing, and simply an analytic distinction (e.g., Nietzsche 1967c, 45). For

example, "race" and "gender" are usually regarded as aspects of "what" we are, but their meaning and significance can change over time, depending on how we carry or transfigure the effects they generate (i.e., with "who" we are).

12. The following intellectual cartography could also be extended to map different moments in Hannah Arendt's reflections on action, thinking, and judgment, as well as a variety of interpretive approaches to her writings (as sug-

gested in subsequent notes and citations).

13. Theories of political judgment that draw on a neo-Kantian universalism or sensus communis can be analogous to this perspective in important ways, because they tend to efface rather than address the challenges that will-to-power poses to thinking (even when they evade the positivist tendency to conceive "mental faculties" in epistemological terms). When such accounts invoke a universality, "common world," or "shared taste" that are now thoroughly contested through genealogical critique, some may read them as having a nostalgic or coercive air (e.g., Arendt 1958, 50–58; idem 1982; Benhabib 1992, 89–144).

14. Theories of political judgment assume a similar perspective when they emphasize political action's "agonistic" character (e.g., Arendt 1958, 194) without sufficiently articulating responsiveness for the effects of our activities or performances on others and the world. In other words, like its apparent opposite, this perspective must be wary of occluding or inadvertently authorizing the thoughtless exercise of power. While an interpretation deploying Nietzsche and Arendt's "institutionalism" politicizes agonism (Honig 1993, 69–75, 96–125), in my view, we also need to distinguish between "making" or "governing powers" and collaborative, political power (see below) not only to chasten agonism's potential to slide into thoughtless assertion but also to address and avoid the nostalgic and coercive air sometimes associated with the "first camp."

15. Theories of political judgment informed by this third perspective would contain the agonism or virtuosity of performance by invoking a sensus communis. In other words, Kant is employed to temper Nietzsche (e.g., Arendt 1978, 1982; Villa 1992). As we shall see, in its effort to reconcile the preceding views, this perspective is subject to the problems of each.

16. To be more precise, what he does tell us usually attributes an essential character to whole classes of human beings in ways that contradict his perspectivism and related philosophical commitments. In my view, Nietzsche mistakenly assumes that the diversity of bodies and perspectives can appear without political spaces. This and other matters on which I seek to persuade the reader to follow Arendt rather than Nietzsche—or vice versa—hinge on philosophical issues (ontological and linguistic); for more detailed considerations of these matters than I can pursue here see e.g., Connolly 1991, 1993; White 1991.

17. Arendt relegates all of this to bodies, their "necessities" and "irresistable tendencies," which she regards as without political relevance unless they threaten to intrude upon "the public" (1958, 45-47, 68-73). Arendt does not view the "private," bodies and "what" we are as without value, but she does strictly circumscribe their place in politics (their relevance to "who" we are).

18. In consumer society, making has been colonized by laboring (Arendt 1958, 102, 124, 126, 152-53, 157).

19. Arendt would deny the latter point, given her views about the relationship between our *bodies* and political action.

20. I am elaborating Arendt's thinking as it is transfigured by an encounter with Nietzsche. Thus, in what follows I may challenge or contradict some of Arendt's views, especially her "late" formulation (Arendt 1982; see Beiner 1982, 89–94). But my task in this context is not to document her views but to illuminate political thinking.

21. If this seems implausible, consider (recurring to an earlier example) that actually understanding how "what" you are effects others (e.g., the "sort" of person with a history and location that inclines you to speak often and freely while deliberating, which reinforces others' predilection not to do

so) might lead you to alter "who" you are (how you listen to others, when and how you speak). Though the example may seem banal, in my view it would be impossible to overestimate the number of political spaces that have disintegrated or

mate the number of political spaces that have disintegrated or descended into thoughtless assertion when people are not willing to transfigure "who" they are in this or similar ways.

22. This formulation may not be inconsistent with recognizing, hearing, or letting "others" be (e.g., Benhabit 1992; Connolly 1991; White 1991), but it does reflect a different emphasis. In my view, we need to educate the different different the selection of the s emphasis. In my view, we need to acknowledge the need—perhaps inevitability—of each transfiguring "who" she or he is in response to others (to some extent, Connolly [1993] moves in this direction), because the latter is a condition of the creation and sustenance of political spaces. I understand the centrality given the will-to-power as distinguishing what I advocate from a Gadamerian "fusion of horizons." No doubt, some will find my story still too "moralistic," while others will judge it to be "nihilistic," because insufficiently discriminating.

RESEARCH NOTES

AN INDIVIDUAL-LEVEL MULTIEQUATION MODEL OF EXPENDITURE EFFECTS IN CONTESTED HOUSE ELECTIONS

CHRISTOPHER KENNY Louisiana State University
MICHAEL McBURNETT University of Illinois at Urbana-Champaign

The shall address questions concerning the impact of candidate spending in congressional elections in a new way. We develop a multiequation model of congressional vote choice that takes the endogeneity of expenditures into account. We then estimate both this model and the more traditional single-equation model using individual level survey data. The substantial differences we find between the two models indicates that the simultaneity bias present in the single-equation model is not trivial. The challenger and incumbent expenditure terms are each significant (whereas only challenger expenditures are in the single-equation setup) and of much greater magnitude in the multiequation case. In addition, we evaluate hypotheses grounded in persuasive communications theory concerning the type of individuals most affected by the messages emanating from the campaigns. We find that individuals with higher education, those with greater interest in campaigns, and those with strongly held convictions are unaffected by candidate spending, whereas individuals lacking each of these attributes are greatly influenced by campaign expenditures.

Since the late 1960s, the amount of money spent by candidates for public office has grown dramatically (Alexander 1992, 82). This spending has generated a corresponding amount of scholarly activity concerned with, among other things, the role that all this money plays in the electoral process. This has been particularly true of congressional races, where most of the efforts to determine the impact of money have been focused (Green and Krasno 1988, 1990; Jacobson 1978, 1980, 1984, 1985, 1990; Ragsdale and Cook 1987; Thomas 1989, 1990). Despite these efforts, the fundamental question of whether increased spending is beneficial to both challengers and incumbents remains unresolved. Intuitively, it seems obvious that spending should enhance a candidate's electoral prospects. Empirically, however, the results are far from conclusive; and recent debates have brought this issue to the forefront again (Green and Krasno 1990; Jacobson 1990).

It is also the case that most of the efforts have been conducted at the aggregate level of analysis; total expenditures for each candidate affect the share of the vote the candidate ultimately receives. Much less work has been done at the level of the individual, so we know relatively little about how the effect of money works, that is, the types of candidates and messages that are most influential and the types of individuals that are most responsive to campaign spending. In addition, individual-level analysis might clarify the inconclusiveness that exists at the aggregate level.

We examine the challenger-versus-incumbent campaign-spending question in a new way. Employing an individual-level analysis of congressional vote choice, we model the relationship between money and vote choice as a system of equations. More specifically, we treat the expenditures as endogenous variables, thus taking into account one of the major

points of contention in this debate. In addition, this individual-level design allows us to evaluate hypotheses grounded in persuasive communications theory concerning the type of individuals most affected by candidate spending.

CANDIDATE SPENDING IN CONGRESSIONAL ELECTIONS

Research on the effects of expenditures in competitive congressional elections has focused primarily on aggregate outcomes. Following Jacobson's (1978) seminal article, scholars have attacked the problem in a number of ways. From this body of research, two general results have emerged. First, spending by challengers has consistently been shown to increase their share of the vote. The more challengers spend, the better they do. Second, the same cannot be said of incumbent spending. The evidence in this case is far more conflictual and seems, more often than not, to show that incumbent spending has no effect; that is, increased spending by incumbents does not help them get reelected. This result makes sense empirically, it is argued, because incumbents typically spend large amounts of money in the face of a strong challenge (ibid.).

Many have not been satisfied with this explanation, however, and the bothersome null effect for incumbent spending has generated a great deal of scholarly research. For competitive House races, Jacobson has consistently shown that incumbent spending has no statistically significant effect on the outcome of the election (1978, 1980, 1985). Green and Krasno (1988, 899) argue the opposite and base their conclusions on model misspecification. They show that incumbent expenditures tend to depress the

challenger's share of the vote, although their results are difficult to interpret because of a large number of complicated interaction terms and a nonlinear model specification. Ragsdale and Cook (1987) report inconsistent results. Thomas (1989, 1990) also argues that incumbent expenditures matter. He develops a theoretical model and tests it empirically. The results indicate that incumbent expenditures in the 1978 and 1980 elections are positively related (but not significantly so) to the challenger vote share. Clearly, the aggregate analyses have not settled this debate.

Much less work has been done at the individual level. Jacobson considers campaign spending in models of individual familiarity with candidates for House and Senate races (1978, 1980) and preelection vote preference (1990). The latter article includes expenditures for both challengers and incumbents and finds that incumbent expenditures do not affect the outcome. The methodology of Jacobson's 1990 article was contested by Green and Krasno (1990) because of the presence of identifiable measurement error in the expenditure terms. Ragsdale (1981) models the process by which voters evaluate challengers and incumbents in 1978 congressional races. For the House races in the study, she found that evaluations of challengers "negatively affect" the "opinions of incumbents without the reverse being so" (ibid., 201). Her model examines the structural effect of the campaign, including contact by candidates, both through the media and direct campaign efforts and through recognition of the candidate. These factors, for each candidate, are filtered through candidate evaluations and then affect the vote (ibid., 208).

A solid body of theoretical evidence holds that challenger expenditures, incumbent expenditures, and voting outcomes comprise a system of equations (Green and Krasno 1988; Jacobson 1978, 1980, 1984, 1985; Thomas 1989, 1990). Money and electoral outcomes are closely intertwined, it is argued, and any representation of how spending affects outcomes must take this simultaneity into account. A multiequation model is thus necessary to estimate these relationships correctly. Challenger spending is determined by a set of independent variables. Incumbent spending is a function of challenger spending (and other variables) since incumbents spend in proportion to the challenger they face (Jacobson 1978). Both expenditure terms appear in the outcome equation, as do other independent variables.

In summary, the weight of the theoretical evidence tells us that challenger and incumbent expenditures are endogenous to the voting process and that these terms are themselves functions of other variables. Accounting for this simultaneity at the aggregate level has not cleared up the debate over whether incumbent spending affects electoral outcomes, however. Turning to the individual level does not help because analyses of congressional vote choice typically ignore the effect of spending (Brown and Woods 1991; Kiewet 1983). As a consequence, structural models of individual-level vote choice explicitly incorporating expenditures are not found in the literature.

We shall develop a three-equation model of the effect of expenditures on individual congressional vote choice. Estimating a model of this sort requires sets of variables that do not normally appear together in individual-level surveys, however. Information from different sources was used to construct a data set appropriate for evaluating the sorts of questions we are interested in.

THE DATA

Assessing the effect of candidate spending on vote choice requires both individual-level survey information and the campaign expenditures of the congressional candidates who ran in the various districts. We chose the 1984 Inter-University Consortium for Political and Social Research American National (Pre- and Post-) Election Survey (ANES) for the individual level data used in the analyses that follow. These data provide a measure of congressional vote choice as well as standard sociodemographic and attitudinal controls typically used in individual-level vote choice models.

To the survey we added additional information on the congressional candidates, their expenditures, and the setting in which the election took place. Aggregate-level data on campaign spending by the challenger and incumbent running in the respondent's district were gathered from Federal Election Commission reports and added to the survey. Measures of the number of opponents that the incumbent and challenger faced in primary elections, their political party affiliation, and the level of support for the challenger in the previous election were created from information provided in America Votes (Scammon and McGillivray 1985). A measure of the number of terms the incumbent had served was constructed from information provided in the Almanac of American Politics (Barone and Ujifusa 1986). An objective measure of seat safety and the quality of the challenger were coded from information provided in Elections 84 $(1984).^{1}$

Given the nature of our investigation (competitive districts with an incumbent running) and the multi-equation specification of the model, some reduction in sample size is inevitable. A description of the subsample of respondents and congressional districts included at each stage of the analysis is reported in the appendix.

THE BASIC MODEL

We investigate directly the impact of challenger and incumbent expenditures on vote choice by estimating the following system of equations:

Challenger Expenditures = f (Challenger Party, Challenger Party Strength, Incumbent Terms in Office, Challenger Political Experience, Challenger Opposition in the Primary, Seat Safety) (1)

Incumbent Expenditures = f (Challenger Expenditures, Challenger Party, Challenger Party Strength, Incumbent Terms in Office, Challenger Political Experience, Incumbent Opposition in Primary, Seat Safety) (2)

Vote Choice = f (Challenger Expenditures, Incumbent Expenditures, Same Party, Reagan Approval, Economic Expectations, Sex, Race, Education, Age, Income, Presidential Coattails). (3)

We diverge from other individual-level analyses in the specification of the vote choice equation (equation 3). The dependent variable in our model measures whether a respondent voted for the challenger or not, rather than candidate familiarity or preelection vote intention (Jacobson 1978, 1990). In terms of the spending variables, we include expenditure terms for both candidates, rather than just for nonincumbents (Jacobson 1978, 480). We also include a standard array of demographic controls, such as the respondent's sex, race, age, education, and family income (the specific codings for the independent variables are included in the tables).

The other independent variables are not quite as well known, and a brief word about their construction is in order. Economic expectations is a threecategory variable measuring the extent to which respondents believe the economic future of the country is going to improve, remain the same, or get worse. The respondent's rating of the job president Reagan was doing is measured by five categories ranging from -2 (strongly disapprove) to +2 (strongly approve). Related to this measure is a variable we construct to capture a possible coattail effect. This variable is an interaction between Reagan approval and a dummy variable for challenger's party identification. The dummy is coded 1 if the challenger is a Republican and 0 otherwise. This variable ranges from -2 to 2. We expect that respondents who liked the job Reagan was doing will be more likely to vote for a Republican challenger. Finally, a dummy variable measuring whether the respondent identifies with the same party as the challenger or not is included to capture the degree to which party affiliation affects vote choice.

There are basically two ways that expenditure terms have been incorporated into vote choice equations. The first simply uses the aggregate expenditures reported to the Federal Election Commission. Jacobson (1990) employs this method in his singleequation model of individual-level congressional vote choice. As Green and Krasno point out, however, this method ignores the endogeneity of expenditures: "If incumbents spend more because they feel their support slipping, then the individual-level analysis will show that the more incumbents spend, the more their support slips away" (1990, 371). The second method makes use of the theory developed at the aggregate level in a micro model of candidate choice. Instead of actual expenditures, instrumental variables are constructed by regressing the two expenditure terms on all exogenous variables in the system and obtaining the predicted values from each. The predicted values from these first-stage equations are then used in the second-stage vote choice equation. We argue that the single-equation model produces insignificant incumbent expenditure effects because it suffers from the same simultaneity problems of many aggregate models. Estimating a system of equations accounts for the endogenity of expenditures and should produce the intuitively sensible result that spending improves electoral prospects for incumbents as well as challengers, although probably not quite to the same degree.³

We investigate this possibility by estimating both the single and multiequation models of congressional vote choice described. First we develop and estimate a standard logit model of vote choice for the House races present in the 1984 postelection wave of the National Election Study (NES). We then estimate the same model again, but instead of actual expenditures we include the constructed instruments for both incumbent and challenger spending described by the structural equations (equations 1 and 2). In addition to reporting tables of these coefficients, we use the model to consider the magnitude of the expenditure effects by holding all other variables constant at their mean values and varying the expenditure terms from zero to one million dollars.

These procedures are employed in Table 1 and Figure 1. The right column of Table 1 contains the results of our two-stage estimation and the left column contains the results of the single-equation estimation. Comparison of the estimated parameters for the expenditure terms across the two models is an illustration of simultaneity bias in the single-equation model. Challenger spending is highly significant and its sign is correct in the single-equation model. Incumbent expenditures in this model, however, appear not to be related to vote choice. In the multiequation model, this counterintuitive result is corrected. The estimates for both challenger and incumbent expenditures are statistically significant and have the proper sign. In addition, Figure 1 shows that these coefficients are severely attenuated in the single-equation model. The effect of spending is much greater in the multiequation model, although challengers gain more from increased spending than do incumbents. These results are clear indicators of the presence of simultaneity bias in the parameter estimates.4

The parameter estimates for the other terms are relatively stable. Generally, the same set of exogenous variables are significant in each case. Neither race, sex, education, nor income have crisp statistical effects in either model. Economic expectations fails to meet the test of statistical significance here, though it has been shown to have an impact in other races (Jacobson 1990). Finally, the Reagan approval and coattail variables are strongly significant and properly signed. Individuals who approve the job President Reagan is doing are more likely to vote against the House challenger, unless that House challenger is a Republican, in which case they are more likely to vote for him or her.

Incumbent expenditures matter in election contests for seats in the U.S. House of Representatives. Spending by the incumbent reduces the likelihood that individuals will vote for a challenger and this spending may have a significant impact on the outcome of the race. We now turn to the general question of how this spending effect works.

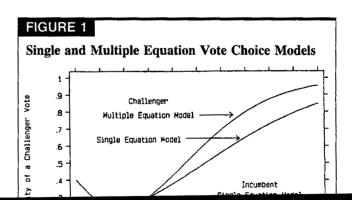

Campaign Spending as Persuasive Communication

So far we have demonstrated that spending by both challengers and incumbents affects individual vote intention when this relationship is modeled in a theoretically appropriate way. But demonstrating an is the source of any direct connection we may uncover between money and votes" (1990, 344).

It is perfectly reasonable to interpret the effect of money on vote intention in terms of persuasive communications. Generally, a high percentage of the campaign budget is spent on producing and distributing messages either in favor of the candidate or against his or her opponent (Goldenberg and Traugott 1984). In order more fully to understand the effects of spending in an election campaign, however, we need to evaluate this assumption directly. Several questions concerning the nature of this effect naturally arise. What type of individuals are most or least affected by the messages? What type of candidates are most appealing? Does the type of message have any bearing on its impact?5

Fortunately, a great deal of theoretical and empirical work in social psychology attempt to describe the influence of persuasive messages.6 These studies have identified a number of factors that influence the extent to which a message is persuasive or not. These factors can be grouped into several categories depending on which part of the persuasion process they affect. For example, characteristics of the individual receiving the message (the target) have been found to be important. Individuals with firmly held beliefs are less easily persuaded, as are the more interested and highly educated (Milburn 1991). Certain characteristics of the source of the message have been found to be effective in shaping attitudes as well. The credibility and attractiveness of the source of the message are examples (Lindzey and Aronson 1985). Finally, certain features of the message itself have been shown to affect its persuasive impact. The types of arguments and appeals (e.g., positive or negative), the message style (forcefulness and speed), and the amount of message material (how frequently repeated) are examples (ibid.).

Evaluating the role of each of these factors and potential others would be impossible in the context of this research design. However, the survey-based

design utilized in this study is ideal for examining at least one subset of factors common to any discussion of persuasive communications—the characteristics of individuals receiving the message (the target). Measures of education, interest, and strength of conviction are available in these data and can be utilized to test hypotheses about the types of individuals that are most, and least, affected by the campaign communications. While the other factors are undoubtedly important, we cannot evaluate them in this setting. Essentially, we have to assume they are equal in each case, that is, the candidates are equally credible, attractive, etc.

Individual Characteristics and the Effects of Campaign Spending

Are individuals with more education, those with greater interest in the campaign, and those who hold strong partisan beliefs less susceptible to the persuasive communications emanating from a campaign? In order to evaluate these hypotheses, four interaction terms are created for each estimation of the model. For example, to test the hypothesis that highereducated individuals are less affected by campaign spending, two variables are set equal to incumbent and challenger expenditures for individuals with a post-high-school degree and equal to zero otherwise in each case. The other two terms are set equal to incumbent and challenger expenditures for individuals with less than a post-high-school degree and equal to 0 otherwise in each case. Interest and strength of conviction are handled in essentially the same way. Expenditure variables for each candidate are created for those who are very much interested in the political campaigns that year, for individuals who identify as strong partisans, and for individuals lacking both of these two conditions. This setup allows us to test for differences in the way money affects different types of people by comparing the coefficients on each of these interaction terms. We expect that the educated, interested, and strong partisans will be much less affected by campaign spending, that is, the coefficients will be smaller and less significant in these cases.

Table 2 and Figures 2-4 show the results when these three estimations are made. The evidence clearly supports our hypotheses. Campaign expendi-

tures affect individuals in precisely the way that theories of persuasive communication would predict. Table 2 (column 1) and Figure 2 show that individuals with college degrees are unaffected by spending from either the incumbent or the challenger, whereas those without degrees exhibit very large and significant effects in each case (compare with the baseline result in Table 1, col. 2). Regardless how we interpret this result (skills learned from schooling or traits brought to bear on the education process in the first place), it seems clear that highly educated individuals base their vote decision on factors other than the campaign messages that result from spending money.

Table 2 (column 2) and Figure 3 show the results when interest in campaigns is considered in interaction with the spending variables. Again, individuals

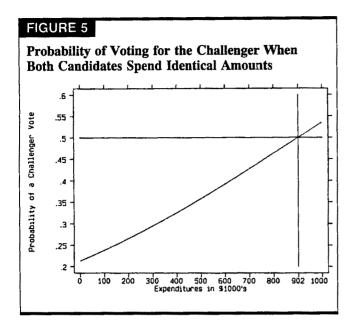

very much interested in political campaigns are much less affected by campaign spending than are those who are only somewhat or not much interested. Less interested individuals exhibit large and significant effects when compared with their more interested counterparts. Although the differences are not quite as pronounced as they were in the case of education, they are still noticeable. Interested individuals undoubtedly find plenty of other sources of information about candidates and do not rely on campaign communications as greatly as less interested individuals.

Table 2 (col. 3) and Figure 4 show the results when strength of partisanship is considered in interaction with the expenditure variables. Once again our expectations are supported. Strong partisans are less affected by spending than are weaker partisans, although the differences are not as great as in the previous two cases. Firmly held beliefs are harder to influence and these results clearly support this notion. Candidates have operated under this assumption for some time, making a pitch for the wavering voters an important part of their campaigns.

SUMMARY AND DISCUSSION

We have argued that the single-equation model of congressional vote choice incorporating actual candidate expenditures is misspecified. As an alternative, we develop a multiequation model in which expenditure variables are endogenous. Our results indicate that the estimates in the single-equation case are biased and inconsistent. Both the challenger and the incumbent expenditure terms are significant in the multiequation case, whereas only challenger spending achieved significance in the single-equation estimation. In addition, the magnitude of these effects is much greater in the multiequation model.

We have also attempted to determine the types of

individuals most affected by these campaign expenditures. Typically, the assumption is made that voters' decisions are not affected by the money per se but rather, that money represents persuasive communications to the electorate, so more money means greater persuasive ability. Deriving our hypotheses from persuasive communications theories, we find that voting behavior is conditioned by the interaction between spending and particular individual characteristics such as education, interest in campaigns, and the strength with which attitudes are held. Respondents with college degrees are unaffected by candidate spending, whereas those with less than a college degree exhibit very large and significant effects. The same pattern emerges for respondent interest in the campaigns and strength of partisanship, although these affects are not quite as pronounced as in the case of education.

These results are not strictly comparable to those reported in the aggregate studies because we operate at a different level of analysis (see Green and Krasno 1988, 1990; Jacobson 1978, 1980, 1985, 1990). They do, however, touch on the main points of contention in the campaign spending literature. First, spending benefits incumbents as well as challengers, although not quite to the same degree. The probability that an individual will vote for each candidate increases as that candidate spends more money. These results support the contentions of, most notably, Green and Krasno (1988, 1990), who argue that incumbents, as well as challengers, benefit from campaign expenditures.

Second, these results may help inform decisions on certain policy recommendations designed to reduce the advantages of incumbency, such as public financing with spending limits for incumbents and challengers. Figure 5 shows the probability of a vote for the challenger when spending by each candidate is equal. The procedure is similar to that employed in Figures 1–4, except that both expenditure terms are

allowed to vary at once. It is clear from this figure that incumbents are advantaged at equal levels of spending until expenditures reach \$902,000 (1984 dollars). It is not until expenditures reach this level that the probability of a vote for the challenger reaches .5, that is, equal spending produces an equal chance of receiving a respondent's vote. While this result seems to suggest that relatively high public assistance and spending limits are necessary to achieve parity, it does not mean that limits and assistance at lower levels could not greatly improve challenger chances (as Figure 5 shows), especially given that challengers typically spend far less than that proposed in recent spending limits legislation.

Finally, the additional knowledge of who is most and least affected by campaign spending suggests that campaigns can perhaps target their resources to an even greater degree than they do now. A common statement made by campaign strategists is that half the money they spend is wasted, the problem being they do not know which half. Our results begin to address this question by describing characteristics of individuals who are unaffected by the expenditures. Table 2, column 3, for example, suggests the overlap (hence loss of efficiency) between spending by political parties to strengthen ties and spending by candidates to influence preference. In general, Table 2 suggests that the individuals most responsive to the campaign spending are also those least likely to vote, since they share many of the same attributes (low interest, low education, and weak partisan ties). A prior analysis has shown that campaign spending, at least for challengers, has its greatest effect on individuals who do not vote (Kenny and McBurnett 1992, 935). In light of this, candidates might consider stepping up efforts to stimulate turnout among groups that traditionally participate at low levels, since a committed person who does not vote does not help the cause.

APPENDIX: DESCRIPTION OF SUBSAMPLES OF 1984 AMERICAN NATIONAL ELECTION STUDY USED IN THE ANALYSES

The data set used in the analyses was constructed by merging campaign-specific information gathered from various sources (see data description in text) with the 1984 ANES study. This procedure created a data set of 2,257 respondents residing in 134 districts. Estimation of the first-stage equations reduces these numbers to 1,368 respondents residing in 103 districts. This reduction occurs because certain respondents have missing values for variables included in the estimations. For the most part, excluded respondents reside in districts that either were not competitive (no challenger) or were for open seats (no incumbent) in 1984 and so are missing on variables such as challenger quality and challenger prior political support. Of the 1,681 respondents residing in compet-

itive districts with an incumbent running, 313 are missing on some other exogenous variable, most commonly the income and/or economic expectations variables. Estimation of the second-stage vote equation reduces these numbers to 938 respondents residing in 96 districts. This reduction occurs because 430 of the 1,368 respondents who survived the first-stage estimations are missing on the congressional vote variable, either because they did not vote at all or because they voted for president but did not vote in the House race.

Fortunately, the distributions on key variables do not change much as the sample size is reduced. Mean challenger spending was around \$117,000 in the 103 competitive districts (first-stage equations) compared to \$118,000 in the 96 districts used in the second-stage estimations. For incumbent spending, these numbers are \$275,000 and \$273,000, respectively. In terms of vote choice, 25.6% of respondents who reside in the 103 competitive districts voted for the challenger, compared to 26.0% of respondents in the 96 districts used in the second-stage vote equation.

Notes

We wish to thank Charles Franklin for his helpful comments on an earlier version of this manuscript.

- 1. Questions may arise as to whether the 1984 ANES study was designed to give representative samples from congressional districts. It is our contention that the sampling within districts is not relevant for the estimation of our model. We have a national sample of voters who were exposed to various campaign stimuli (money) and had personal characteristics relevant to voting (party identifications, etc.). We do not aggregate individuals within districts to estimate district characteristics but rather, estimate an individual-level model of vote choice in which one element of the choice is the candidate spending. In order to estimate the model we need (1) variation in spending across voters (which we have), (2) an assumption that spending (and all other effects) are constant across districts (possibly debatable but certainly the normal practice in modeling congressional voting), and (3) correct model specification. Therefore, whether the sample is representative of the district or not is irrelevant for the analyses we conduct. For an early discussion of this question, see Miller and Stokes 1966.
- 2. This is a standard method of purging any correlation between the instruments and the error terms in the equations. The presence of any such correlation produces inconsistent and biased estimates (Johnston 1984). Bartels explicitly addresses the appropriateness of instrumental variables in a model similar to that used here (1991, 791-93). His model uses aggregate data and does not improve on previous 2SLS estimates of incumbent expenditures. (The t-values indicate that, at worst, the estimate in his model for incumbent spending is zero, and at best, the estimate is inefficient.)
- 3. Many studies have argued that campaign expenditures are subject to diminishing returns and that variables measuring spending should be transformed in some way. We argue that diminishing returns in the expenditure variables are captured in the logit estimations of the equation, which forces the expenditure effects onto the 0, 1 interval. We also estimated the model using the customary logarithmic transformation of the expenditure variables and found little substantive difference from the reported results. The coefficient for incumbent expenditures decreases slightly in significance (p < .10) but remains properly signed.
 - 4. Since our individual-level analysis uses a different de-

pendent variable (vote choice) than has been used in the few previous studies of this sort (preelection candidate preference and candidate familiarity), the reader might be interested to know what difference this made in and of itself. Unfortunately, there is no preelection candidate preference measure in the 1984 ANES (or any other year for that matter) study so a comparison with Jacobson's (1990) results is not possible. When a measure of candidate familiarity is included as a dependent variable (instead of vote choice) in the estimation, the coefficient for challenger spending is significant, but incumbent spending is not. This result holds for both the single and multiequation formats. These results are consistent with those obtained by Jacobson (1978).

5. Obviously, there are other factors that may mediate the effect of spending in congressional campaigns. For example, the medium through which the voter is reached (television, mail, personal contact, etc.) may influence the impact of the message. We take this question up in a separate effort (Kenny and McBurnett 1993).

CONTROVERSY

POPULAR INFLUENCE ON SUPREME COURT DECISIONS

In their 1993 article in this Review, William Mishler and Reginald Sheehan reported evidence of both direct and indirect impacts of public opinion on Supreme Court decisions. Helmut Norpoth and Jeffrey Segal offer a methodological critique and in their own reanalysis of the data find, contrary to Mishler and Sheehan, no evidence for a direct path of influence from public opinion to Court decisions. Instead, they find an abrupt-permanent shift of judicial behavior consistent with an indirect model of influence whereby popularly elected presidents, through new appointments, affect the ideological complexion of the Court. In response, Mishler and Sheehan defend the direct public opinion linkage originally noted, at both individual and aggregate level; respond to the methodological critique; and offer further statistical analysis to support the aggregate linkages.

COMMENT

Among the most important questions that can be asked about the Supreme Court is the role of this unelected and democratically unresponsive institution as a policymaker in the national political system. Supporters of the Court usually make one of two defenses of the institution. First, in what is commonly known as the Madisonian response, supporters claim that the Court is not supposed to be a democratic institution. Its raison d'être is to check the excesses of legislative majorities. The second response is of more recent lineage, tracing its history not to James Madison but to Robert Dahl (1957). According to Dahl, it simply does not matter very much if the Court is unelected and thus procedurally undemocratic because it is responsive to national majorities and thus substantively democratic.

Dahl's explanation for Supreme Court responsiveness was quite simple: the people elect the president and the president selects the justices with the advice and consent of the Senate. Thus, with the exception of the onset of critical or realigning periods, the president's appointment power should ensure a Court whose views represent those of the dominant political coalition.

Mishler and Sheehan (1993b) take Dahl's argument a step further. They argue that Supreme Court decisions not only correlate with public opinion but are directly influenced by public opinion. According to Mishler and Sheehan, the justices "are broadly aware of fundamental trends in ideological tenor of public opinion, and that at least some justices, consciously or not, may adjust their decisions at the margins to accommodate such fundamental trends" (p. 89). After presenting a variety of time-series models, they argue that Supreme Court justices between 1961 and 1981—but not thereafter—were influenced by whatever levels of liberalism existed in public opinion five years earlier. No significant influence is found for contemporaneous public opinion, public opinion lagged at less than five years, or public opinion lagged at more than five years. Because of what we consider to be the questionable nature of their

main finding, we decided to investigate the purported relationship further.

We first discuss the theoretical reasons why it is unlikely for Supreme Court decisions to be directly swayed by public opinion, especially at substantial lags. (This is not to say that Court decisions may not correspond to public opinion through other pathways.) We then conduct a methodological audit of Mishler and Sheehan's time-series analysis. One of the problems is that the authors perform an aggregate-level analysis on an individual-level theory. As we shall show, an examination of the behavior of the individual justices provides little support for their claims. Moreover, their aggregate analysis overlooked a sizable shift of the Court series in 1969–71. That change, corresponding to the transition from the Warren Court to the Burger Court, seriously confounds the estimation of popular influence on Court behavior. When the Court realignment is introduced into the analysis, the effect of public mood vanishes. The same happens when we conduct separate estimations for the Warren era and the Burger-Rehnquist era. The relationship also disappears when we control for contemporary Court ideology, rather than (as Mishler and Sheehan do) lagged ideology. Whatever influence public opinion exercises on the Court occurs indirectly, through the choice of justices by presidents chosen by the people.

SUPREME COURT RESPONSIVENESS TO PUBLIC OPINION

We recognize from the outset that Supreme Court decisions might correlate with public opinion. Dahl's presidential appointment hypothesis is convincing. Indeed, numerous scholars have found that the Court is not generally out of line with public opinion. The most exhaustive examination of this issue to date found that out of 130 Supreme Court decisions that could be matched with public opinion polls, 82 (63%) were consistent with poll pluralities (Marshall 1989, 78). Mishler and Sheehan find a contemporaneous correlation of .56 between public opinion and Supreme Court decisions, though this drops to -.01

once the autocorrelation of both series is removed. Whatever the real-world correlation might be, it is unlikely to be the result of a direct influence of public opinion on the Court.

The public has substantial influence over the votes cast by members of Congress (e.g., Bartels 1991; Fiorina 1974; Kalt and Zupan 1984; Miller and Stokes 1963). This, of course, is because they are electorally accountable. Supreme Court justices, with life tenure, have no personal incentives to allow such influence. If, in fact, they do so, it is because they feel that they ought to (Gibson 1991).

If the justices were behaving in such a civic-minded fashion, one might imagine that they would advertise such actions to their public. Occasionally, statements in their opinions do suggest the importance of public opinion. Mishler and Sheehan bolster their theoretical claim that the Court is influenced by public opinion with one such quote from Justice Frankfurter and another by Justice Rehnquist (1993b, 89). A more systematic analysis, however, demonstrates how rare such claims are. Public opinion is mentioned in less than 2% of majority opinions (Marshall 1989, 35–36), and in only one-fifth or so of the cases in which it is mentioned do the justices suggest that law should reflect public opinion (ibid., 35–39).

In certain substantive areas, especially death penalty cases, the Court does discuss the importance of public opinion with a frequency greater than nil, but the justices' misuse of public opinion polls there shows how little regard they in fact have for that opinion. Justice Marshall, in Gregg v. Georgia (1976, 232) argued that the Court should be guided not by what public opinion polls say but by what they would say if the public were fully enlightened on the particular subject. On the flip side, Justice Scalia, speaking for the Court in Penry v. Lynaugh (1989, 289) argued that public opposition to the death penalty for the retarded is not proven by the fact that the citizens of Texas, Florida, and Georgia-three states overwhelmingly in favor of the death penalty—opposed such executions by majorities of 73%, 71%, and 66%, respectively.

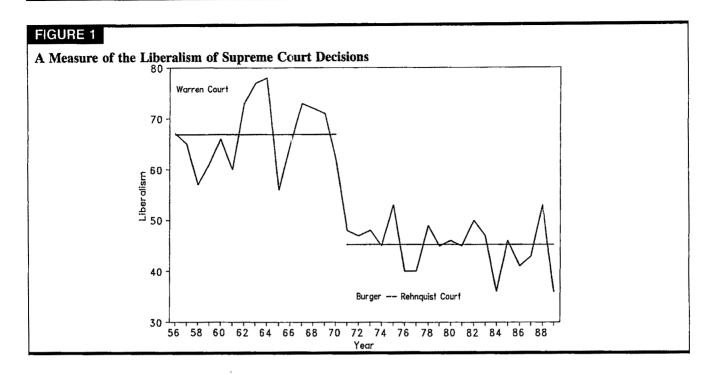

More typical, we presume, of the justices' beliefs, is the view of Justice Jackson: "The very purpose of the Bill of Rights was to withdraw certain subjects from the vicissitudes of political controversy, to place them beyond the reach of majorities and officials and to establish them as legal principles to be applied by the courts. One's right to life, liberty and property, to free speech, free press, freedom of worship and assembly, and other fundamental rights may not be submitted to vote; they depend on the outcome of no elections." (West Virginia Board of Education v. Barnette 1943, 638. The overwhelming indifference of the justices' opinions to public opinion supports the perceived validity of Jackson's statement. It is possible, nonetheless, that the justices react to public opinion even though they may not be aware that they do so, which is where political science enters the picture.² Empirical research on this question is far from complete (that is no doubt why Mishler and

Sheehan embarked on their study), but the evidence that does exist shows that while elected state court judges respond to public opinion (Brace and Hall 1990; Gibson 1980; Kuklinski and Stanga 1979), lifetenured federal court judges show no such influence (Giles and Walker 1975; Songer, Segal, and Cameron 1994).³

Despite this evidence, let us grant the possibility that the Court might be directly influenced by public opinion. Even if it were true, we find it extremely difficult to accept that the Court is influenced by public opinion that is five years old, regardless of the direction that opinion has taken in the intervening years. Yet that is the claim that Mishler and Sheehan make. Their justification is as follows: "Even where the Court responds directly to perceived changes in public opinion as proposed by the political adjustment hypothesis, it still takes time for justices to perceive a change in public mood. More importantly, it takes time for societal trends to be absorbed and reflected in the attitudes and beliefs of the justices or for justices to become convinced that the change is of sufficient salience, magnitude, and endurance as to threaten the Court's authority" (1993b, 91-92).

It is hard to state precisely what one would predict about judicial behavior from such a statement. If it takes a significant amount of time for the justices to learn of the public mood, then there conceivably might be distant lags without contemporaneous ones, as in the five years that Mishler and Sheehan find. But if the justices need to be convinced that the change is salient enough to threaten the Court's authority, then it must be the case that the justices perceive that the change has endured, for there could not be a threat to the Court's authority from public opinion five years removed. There are two contradictions here. First, if the Court only acts on change that has endured, their decisions should be influenced by contemporaneous as well as lagged public opinion. Yet Mishler and Sheehan find no support for contemporaneous opinion. Second, since it takes long periods of time for the justices to learn about changes in public mood (a dubious assumption in and of itself), the justices would never know whether any change five years old had endured to the present.

The theoretical plausibility of the influence of a five-year lag might best be assessed by trying to imagine the internal processing—be it conscious or subconscious—that would lead to such behavior. A justice might, for instance, think: "X is the decision that I prefer (or that I believe the Constitution requires). But public opinion is much more conservative on this issue than I am. Because we are, but should not be, an undemocratic institution, I'll give the public the benefit of the doubt and vote Y." What we find far more questionable is that a justice would say: "X is the decision I prefer, but public opinion five years ago (but not necessarily any longer) was much more conservative on this issue then than I am now. Because we are, but should not be, an undemocratic institution, I'll give the public what it wanted five years ago." To ask whether a justice could think this

way is to answer the question. In that case, however, we must ask how Mishler and Sheehan could have amassed such convincing evidence for a lagged effect of mass opinion.

THE FIVE-YEAR LAG

It is important to note that the evidence comes from an analysis of time-series data. Time, as one sage put it, is a great teacher, but it is also a mischievous one, who loves to play tricks on its students. Over time, many things rhyme for no reason whatsoever, like Super Bowl victories and stock market rallies. This tends to occur rather frequently when observations are in short supply. In their analysis of Court behavior, Mishler and Sheehan work with only 34 observations; that number effectively shrinks to 29 when the public opinion series is lagged five years. Tests of statistical significance may afford some protection against falling victim to artificial relationships, but time, again, has its ways of disarming those alarms. This is especially true when one searches a large number of lags, as Mishler and Sheehan do. While the probability of falsely finding a significant lag for any particular lag is .05, the probability of falsely finding at least one significant lag when one searches lags 0-10 is 1-.95¹¹, or .43.4

To be sure, Mishler and Sheehan are wary of the pitfalls of time series and display great care in avoiding many of them. In particular, they identify the five-year lag from ARIMA-prewhitened cross correlations and control for serial dependence of errors in all their structural estimations. They also test for parameter stability over time and make a substantial adjustment as a result of that test. Nonetheless, Mishler and Sheehan make some judgment calls (or, better,

noncalls), with game-breaking consequences in their time-series analysis.

In a nutshell, the authors treat the Supreme Court during the 1956–89 period as one when it is really two very different courts: a Warren Court and a Burger–Rehnquist Court. The decisions handed down by those two courts have little ideological ground in common. The contrast is especially sharp when (as in the analysis at hand) annual aggregates are used. Figure 1 plots those annual values, as graciously provided to us by Mishler and Sheehan. There is not a single year in which the Warren Court comes out on the conservative side of the mean level for the whole period and not a single year in which the Burger–Rehnquist Courts wind up on the liberal side.

At the very least, such behavior violates the assumption of mean-stationarity. A series is stationary in the mean if its realizations derive from a distribution with a fixed central tendency (Granger and Newbold 1986, 4). That does not hold true for the Court behavior series from 1956–89. Instead, the outcomes of the Warren Court fluctuate around one ideological level and those of the Burger–Rehnquist Court around another one. Failure to control for this gap is bound to confound the effect attributed to any explanatory variable (however plausible) and to give rise to spurious dynamic effects.

A simple way to control for the sharp contrast in Court behavior is to inquire whether the hypothesized relationship between public mood and Court behavior can be confirmed for each Court separately. For that purpose, Table 1 presents correlations up to five lags between Court liberalism and public mood for the Warren Court and the Burger–Rehnquist Court. As can be seen, the correlations at lag 5 are small and insignificant for both Courts, nor are any other correlations significant. There is no evidence

TABLE 1

Correlations between Public Mood and Supreme Court Decisions by Court Era

	SUPREME COURT DECISION		
PUBLIC MOOD	WARREN ERA	BURGER- REHNQUIST ERA	
Unlagged	.03	13	
Lagged one year	.10	.05	
Lagged two years	04	.03	
Lagged three years	.06	.05	
Lagged four years	.25	.14	
Lagged five years	.24	.10	
Standard errors	(.2632)	(.23)	
Number of cases	10–15	19	

Note: Correlations are the Pearson correlation coefficient (R). For the Warren era, the standard errors grow with increasing lags because of a shrinking number of available cases.

that either the Warren Court or the Burger–Rehnquist Court was responsive to variations of the public mood, no matter what the time lag.

Instead of splitting up the time series, we can also reexamine the relationship between public mood and Court behavior by adding a specification for the transition from Warren Court to Burger-Rehnquist Court. For comparison's sake, Table 2, column 1, reproduces results for the whole Court series in the absence of such a specification. Those results show a significant effect for public mood lagged five years as well as for the autoregressive error structure. But these estimates change dramatically when the transition from Warren Court to Burger-Rehnquist Court is introduced. This Court realignment (as we have called the transition) shifted the balance of Court behavior from liberal to conservative in the manner of an abrupt-permanent intervention (Box and Tiao 1975; McDowall et al. 1980). The control for this intervention wipes out the apparent effect of public mood on Court behavior. In addition, the control exposes the errors as being purely random, not first-order-autoregressive, as specified by Mishler and Sheehan. That specification also proves to be an artifact of overlooking the Court realignment.

How, then, the patient reader will ask, could the estimate for a five-year lagged effect of public mood arise? The answer is that exactly five years prior to the Court realignment the mood of the American public, as captured by the Stimson measure, must have undergone a swing of staggering dimension. That is indeed what happened. In 1965–66, the mood series falls from a high point of liberalism to a deeply conservative level. The tandem movement of the Supreme Court five years later is enough, with fewer than 40 observations, to create the appearance of a five-year lagged effect of public mood. As demonstrated in Table 2, were it not for this singular parallel in the two series, no finding of an effect with a five-year lag would have emerged.

Granted, there is some broad semblance between the contours of public opinion and Court behavior, with the generally liberal Court decisions of the Warren era corresponding to a like-minded public mood and the more conservative decisions of the Burger–Rehnquist era doing so for a more conservative public. Nonetheless, compared with Court behavior, the public is far more "moody," shifting frequently from liberal to conservative and vice versa. There is no evidence that the Court pays any attention to all those mood swings of the general public, either immediately or five years later. What remains is that in one singular incident a change of Court behavior duplicated a shift in public opinion five years earlier.

Whatever the reasons may have been for the public mood swing in the mid-1960s, there is little mystery about what changed the Court's behavior in the early 1970s. Within barely two years of taking office in 1969, President Nixon was able to replace four of the nine justices, every one of the newcomers being decidedly more conservative than his predecessor. In their first year of service, the new members (Burger, Blackmun, Powell, and Rehnquist) averaged a liberalism score of 29 compared with an average of 64 for their predecessors (Warren, Fortas, Black, and Harlan) in their last year. A "generational replacement" of such volume and contrast is surely capable of accounting for the Court's ideological realignment in the early 1970s.

Among the remaining justices of the Warren Court, Douglas, Brennan, and Marshall remained loyal to their liberalism, and Stewart to his moderate position. As the correlations for individual justices in Table 3 indicate, the public's mood had no significant bearing on the decisions of the three liberals, regardless of the time lag. For Justice Stewart, we detect a statistically insignificant hint of some instan-

TABLE 2

Supreme Court Decisions as a Function of Public Mood Lagged Five Years and Court Realignment

INDEPENDENT	COEFFICIENTS		
VARIABLES	I	II	
Constant	53.21** (3.63)	66.21** (2.04)	
Public mood (t - 5)	.61** (.26)	.19 (.15)	
Court realignment	_	19.92** (3.00)	
AR(1)	.60** (.17)	09 (.19)	
Ljung-Box Q(8)	2.9	4.8	

Note: Standard errors are given in parentheses. Court Realignment is a binary variable scored 0 for the years 1956–70, and 1 afterward. The public mood series was centered before model estimation to make the constant more interpretable. AR is the autoregressive parameter. $^*p < .05$. $^*p < .01$.

TABLE 3

Correlations between Public Mood and Decisions of Individual Justices

Public	Decisions of				
mood	Douglas	Brennan	Marshall	Stewart	White
Unlagged Lagged one	.03	.16	.21	.39	.15
year Lagged two	.06	.16	.16	.32	.23
years	.11	.20	.23	.24	.32

taneous effect, but nothing with a delay of five years. Only one justice appears to exhibit in his individual behavior what the Court underwent as a whole. There exists a bivariate correlation between Justice White's votes and public opinion five years earlier. And like the Court as a whole, this justice shifted from liberal to conservative during the transition years. But whether his conversion can be attributed to the public's turn toward conservatism five years earlier is doubtful. After statistically controlling for his abrupt-permanent shift, White shows no evidence of responding to public mood. Alternatively, prewhitening renders the lagged correlations at four and five years insignificant. Further evidence is provided by the fact that he has shown little inclination to follow other mood swings of the general public, especially the liberalization of the 1980s. Why would he have reacted to public opinion then, but not more recently? White's conservative shift in the early 1970s could be just as plausibly (if not more so) attributed to a new conservative president (Epstein, Walker, and Dixon 1989), a new conservative Court and/or chief justice (Murphy 1964), or simply to changes in his own preferences that were totally uninfluenced by changes in public preferences half a decade earlier.

To be fair, let us acknowledge that Mishler and Sheehan are not oblivious to the change in the Court's ideological composition. Indeed they control for a compositional effect by introducing a measure of ideological preferences designed by Segal and Cover (1989). While the addition of a Court membership variable does attenuate the effect of public mood, Mishler and Sheehan are still able to report significant results. It is not a trivial feature of this control,

however, that Court membership enters the analysis with a lag of one (year). In other words, the authors suppose that the Court's decisions this year derive from the Court's ideological complexion last year. But why last year and not this year? In particular, how telling are last year's ideological inclinations for this year's decisions when the membership of the Court has greatly changed? As Table 4 shows, when ideological composition enters the analysis unlagged, the effect attributed to public mood disappears.'

In an important way, Mishler and Sheehan themselves qualify the finding that the Supreme Court is responsive to public opinion. The authors note that "the ideology of the public mood and the decisions of the Court have diverged rather sharply since President Reagan's election in 1980" (1993b, 94). To accommodate this divergence they include an interactive term for public mood during those years. The estimate for this interaction is negative, while the estimate for mood across the whole period is positive. Taken together, this suggests that during roughly one-third of the period examined, public opinion had little effect on Court behavior. But why did the Court suddenly prove unresponsive to public opinion? There is no evidence that the Court's ideological tenor changed in 1981. What did change was public opinion. Surprisingly, Stimson's mood measure swings toward the liberal side during the Reagan years. It is a turn that the Court did not follow in its decisions. But if the Court appears free to ignore the public mood at one moment, it may be simple coincidence that its decisions square with the public mood at another moment.

In short, Mishler and Sheehan's aggregate results are seriously confounded by a violation of the mean-stationarity assumption (to put it technically). But even if we ignored this assumption, their estimates would have proved insignificant had they controlled for contemporary Court ideology, not lagged Court ideology. Moreover, even without this control (and again ignoring the stationarity problem), the results they provide are entirely due to a shift in public mood in 1965–66 that coincided with a change of Supreme Court voting behavior in 1970–71. That result, as our

TABLE 4

Supreme Court Decisions as a Function of Lagged Public Mood and Contemporaneous Court Composition

INDEPENDENT VARIABLES	COEFF.	S.E.
Public mood (t - 5) Court composition (t) AR(1)	.09 3.29* 35 × 10 ⁻²	(.19) (.59) (.19)
Ljung-Box Q(8)	5.1	

Note: All variables were centered prior to model estimation—hence, no constant. N = 34. AR is the autoregressive parameter.

*p < .01.

individual-level analyses demonstrate, is virtually entirely due to changes in the Court's composition. Finally, the authors' extensive search for lags ignores the corresponding increase in the probability of a type I error.

DISCUSSION

Does public opinion influence Supreme Court decisions? If the model of influence is of the sort where the justices set aside their own preferences and abide by what they divine as the *vox populi*, our answer is a resounding *no*. In particular, we find no evidence that such an influence occurs with a delay of five years. What we do find, however, is that a sizable ideological shift in Court behavior took place in 1970–71 in the wake of an unmistakable swing of public opinion roughly five years earlier. This might be pure coincidence. With no more than one incident of this kind in the data available, caution may be well advised. On the other hand, this incident may be consistent with a model of influence, but of a very different sort.

While justices are not accountable to the populace, presidents and senators, who share the power to choose them, are. Whatever configuration of public opinion elects a president, in particular, could transpire in his or her Court appointments. Given plentiful opportunity to put new members on the Court, a newly elected president can alter the Court's ideological complexion. It is not that the justices pay keen attention to public opinion but that they have been chosen by a president (with the advice and consent of the Senate) who presumably shares the public's views. If, however, the president is elected on the basis of issues orthogonal to those decided by the Court or in the absence of voter concern for ideological issues, then there is no reason to believe that his or her appointees will reflect public opinion in their judicial opinions. This is the crucial difference, from a responsiveness standpoint, between justices who are directly (versus indirectly) influenced by public opinion. Supreme Court responsiveness will not necessarily exist but will be dependent on the nature of presidential elections. For instance, if Ronald Reagan had been elected in 1980 because of the economy and foreign affairs and not his conservative social agenda, then we would expect little match between public mood and Court decisions in the 1980s. Alternatively, if we assume that the public's mood swing in the mid-1960s helped carry Richard Nixon to the presidency, we may be able to credit the public with an indirect hand in the Court's shift to the right in the early 1970s. By 1971, Nixon's appointments of new justices had definitely shifted the ideological balance of the Supreme Court to the conservative side. This shift was reinforced during the next 20 years, since all vacancies on the Court were filled by Republicans in the White House. Every quarter century or so, it seems, public opinion has its day in court, although it may take years to be sure.

HELMUT NORPOTH JEFFREY A. SEGAL

State University of New York, Stony Brook

RESPONSE

In their wide-ranging critique, Helmut Norpoth and Jeffrey Segal raise both theoretical and methodological objections. They assert not only that we fail to justify the direct effects observed between public opinion and Supreme Court decisions but also that there are good theoretical and empirical reasons to doubt such effects. They also conduct "a methodological audit" of our analyses, alleging that we (1) use "aggregate-level analysis on individual-level theory," (2) specify an atheoretical lag structure of dubious empirical validity, and (3) fail to recognize or control serious problems of mean-nonstationarity in our measure of Court decisions.

In response, we argue first that theory and research on the impact of public opinion on Supreme Court decisions are both in short supply. None of the hypotheses in the literature, including that which they prefer, is derived from well-developed theory. Yet all are sufficiently plausible to warrant empirical scrutiny. Second, the debate over the impact of public opinion on Supreme Court decisions raises both aggregate- and individual-level questions, but the aggregate questions are logically prior and more important. Moreover, contrary to Norpoth and Segal's claim, data on individual-level effects are wholly consistent with our aggregate conclusions. Finally, we defend the lags in our models, demonstrate that nonstationarity is not a problem (in part because the principal variables are cointegrated), and argue that Norpoth and Segal misspecify our model. A properly specified model, estimated appropriately, confirms that public opinion has both direct and indirect effects on Supreme Court decisions during the Warren and Burger years.

THEORIES OF POPULAR INFLUENCE ON SUPREME COURT DECISIONS

Norpoth and Segal grant our larger point that the Supreme Court is responsive to public opinion. The controversy centers on whether the effects of public opinion are wholly mediated though the impact of presidential appointments on the ideological composition of the Supreme Court or whether public opinion can influence Court decisions more directly. The most perplexing criticism, they advance, is that we fail to justify the hypothesized direct effects of public opinion. In fact, we devoted more than a page to explaining possible effects, most of which discussion

focuses on the rationale for direct effects (1993b, 88–90). Importantly, the direct-effects hypothesis is *not* original to us. It has a long and distinguished pedigree, as we documented. Our contribution is

simply to test the hypothesis empirically.

The direct-effects hypothesis has two distinct explanations. One, linked to Justice Frankfurter, holds that the Court is a political institution whose authority depends on public deference and respect. Sensitive to this, justices are careful not to jeopardize the Court's authority by departing too far or too long from majoritarian views on fundamental issues. The theory is not that justices routinely change their decisions based on public opinion polls but that some justices occasionally modify their decisions (if not their personal beliefs) on important issues in response to long-term and fundamental changes in public opinion perceived as threatening the Court's authority. A second explanation, which we link to Justice Rehnquist, holds that justices are influenced (albeit often unconsciously) by the same forces that impinge society as a whole. Here, the argument is not that justices vote contrary to their beliefs in response to public sentiment but that the beliefs of at least some justices occasionally change in response to fundamental longterm shifts in what Stimson calls the public mood, and Lippman, the public philosophy. In retrospect, we probably erred in applying the label, "political adjustment hypothesis" to both versions. The Rehnquist perspective might better be labeled a "political socialization" or "attitude change" hypothesis. Both perspectives, however, predict that public opinion will influence Court decisions unmediated by presidential election/selection.

Norpoth and Segal go further, however, and assert that the direct-effects hypothesis is positively insupportable in theory and contradicted by existing research. They reason that since justices are not electorally accountable, they will respond to public opinion only if they "normatively feel that they ought to." Moreover, if justices respond to public opinion out of a sense of civic-mindedness. Norpoth and Segal claim that they certainly would advertise this in their decisions, which, apparently, they do not.

This, however, is a straw man. First, the hypothesis that direct effects can occur only if justices hold democratic role orientations is not one we advanced or discussed. Second, the supportive quotations cited from Justices Jackson, Scalia, and Marshall are normative statements to the effect that public opinion should not influence Court decisions. They do not address the empirical question whether public opinion does influence the Court or speak to the plausibility of either the political adjustment or socialization hypotheses.2 Third, the observation that justices rarely cite public opinion as justification for their decisions is irrelevant. If justices respond to public opinion via the political adjustment or socialization pathways, they are unlikely to advertise the fact that they are "caving in" to public pressure or have changed their minds in response to evolving social mores. Consider, for example, Segal and Spaeth's

(1993) argument to the effect that judicial decisions are driven principally by the attitudes and beliefs of individual justices. If this is true (and we are generally persuaded), in what percentage of cases does the majority defend its decision in terms of the justices' personal attitudes and beliefs? We doubt the figure is as high as 2%. The point, of course, is that such evidence is meaningless.

Norpoth and Segal also cite, without discussion, two articles that, they claim provide evidence contradicting public opinion effects (Giles and Walker 1975; Songer, Segal, and Cameron 1994). In fact, neither article addresses the issue in any substantial manner. Giles and Walker report a nonsignificant, zero-order correlation between an indirect measure of federal district court desegregation policies in 1970 and the percentage of votes cast in judicial districts for George Wallace in 1968—hardly a stern test of public opinion effects on Supreme Court decisions, nor do Giles and Walker claim otherwise. Songer, Segal, and Cameron examine whether individuals on the U.S. Courts of Appeals decide search-and-seizure cases according to personal policy preferences or the policy dictates of the Supreme Court. Public opinion is not addressed except in a single note claiming that the inclusion of Stimson's public mood variable in a multivariate model produced an insignificant coefficient. The results are not shown, and no mention is made as to whether the specification for public opinion was appropriately lagged, included an interactive term for public opinion during the Reagan years, or attended to other important methodological and specification issues. Since this is the totality of research cited in defense of the proposition that public opinion effects are contradicted by previous research, we think it fair to conclude that our decision to explore public opinion effects in a more systematic and rigorous fashion is reasonable and appropriate.

More generally, the attack on the theoretical plausibility of public opinion effects seems misplaced. What passes for theory in this area on both sides of the issue is little more than speculation mixed with substantial doses of wishful thinking and post-hoc rationalization. Norpoth and Segal have their preferred hypothesis. Other scholars and jurists suggest several others. None is deduced from first principles or is supported by much systematic research—which is why we chose to examine the issue more rigorously.

ON THE THEORY AND EVIDENCE OF A FIVE-YEAR LAG

Norpoth and Segal also take us to task for failing to justify the five-year lag specified for the impact of public opinion. They acknowledge our prediction that the political adjustment and socialization effects should occur at significant lags, but they criticize our failure to provide a "precise" theoretical prediction of the lag's length. This seems unreasonable. Existing

theory does not-and cannot reasonably-provide a precise specification of this lag any more than the Segal-Spaeth attitudinal model predicts the precise impact of judicial attitudes on Court decisions. Segal and Spaeth estimate empirically the impact of attitudes on Court decisions just as we use empirical methods to estimate lag-lengths. Consider a group of men during the 1960s and 1970s who began to comprehend the reality of gender discrimination when it was experienced by their wives and daughters seeking educational and employment opportunities. Precisely how long does theory predict it will take the average male to begin to reexamine and change long-held attitudes and values about the role of women? No doubt it varies across individuals. We know of no theory that specifies the precise lag or even a rough estimate. Even if such theory existed it likely would be of little help in identifying the lag specifically for the small and atypical group of Supreme Court justices. Rather than resort to post hoc rationalization, we think it preferable to admit the limits of theory and proceed to specify the lag-lengths
